THE FARM PAPER OF THE NORTHEAST

## The 1951 Farm Outlook

By HUGH COSLINE

**N**EVER since we have made an outlook story an annual feature has it been so difficult to see ahead. War and the prospect of war, or at best preparation for defense at a much faster rate, is the most important factor affecting farming prospects. *It seems certain that we must stay strong if we wish to remain free.*

While farm management is as important as it ever was, it is still true that what happens at national and international levels is likely to affect your farm operations as much or more than what you do on your farm in 1951. It is essential, therefore, that you watch events as they develop and be ready to shift your plans. It will be our aim during the coming year to keep you informed as completely as possible.

### PRICES

In general you may expect higher prices in 1951, both for what you produce and for what you buy, although prices of a few individual farm products may be lower. Continued inflation is indicated by the prospect of more deficit spending, higher wages, and some shortages as industrial production is transferred to defense needs.

As industrial production for consumer use declines, workers will be unable to find the usual amount of industrial products to buy and, therefore, may spend a higher percentage of income for food. With reasonably good weather it is impossible to imagine a food

shortage in 1951. Food exports will be light unless we get into a full-scale war.

Much is being *said* about controlling inflation but little is being *done*. Most economists agree that price controls treat the symptoms of inflation rather than the causes.

Delegates attending the Farm Bureau Federation meeting at Dallas, Texas, wired the President on December 14 as follows:

"IT IS OUR WELL-CONSIDERED AND UNANIMOUSLY-APPROVED OPINION THAT PRICE CONTROLS AT THE PRESENT TIME WOULD BE A TRAGIC ERROR."

Farm Bureau Federation leaders believe that increased production is one way to attack inflation and that controls are certain to hamper efforts to increase production. Nevertheless, we are certain to have government controls, probably as soon as machinery can be set up.

Another way to fight inflation is by paying more of the cost of defense in cash instead of credit. It's unpleasant but necessary. Individuals who fight for increased incomes to meet "increased living costs" and who bid up prices of scarce items are feeding the fires of inflation. *The bare facts are that we cannot make adequate defense preparations without sacrificing some of the superfluous gadgets which make up our standard of living.*

### MILK

Here are some slants on important northeastern farm enterprises: Dairymen have one fortunate circumstance, namely, that the Class 1 price formulas now in effect in Boston

and New York will tend to keep milk prices fairly well related to production costs. This was not true in World War I. Neither was it true in World War II when the butter-powder formula was in effect, although prices were kept in reasonable adjustment through the activities of cooperatives and by suspension of the provisions of the order.

On a long-time basis dairymen need to watch the development of milk concentrates and nation-wide barn inspection codes. The more Class 1-A milk sold to consumers, the better the price to producers will be. Therefore a cent a hundred for "Milk for Health" looks like a gilt-edged investment.

Any steps you can take to improve average milk production per cow will lower production costs per cwt. Such steps include disease control, careful purchases, producing better roughage, etc.

### POULTRY

Because egg supports have been discontinued it seems probable that egg prices during the spring months will be below last year's figure. If *slightly fewer* chicks are raised by poultrymen, the situation could right itself by fall.

The big question, of course, is who would cut the number of chicks raised? If you have an efficient, profitable operation it seems logical for you to raise the normal number. On the other hand, if you have been losing money or just breaking even, perhaps you are the one who should go out of the poultry business entirely. Certainly the right individuals are far more likely to stay in business than they were when inefficiency was fostered by price supports.

Chickens and chicken feeds have been improved to the point where broilers and other poultry including turkeys can be grown and sold profitably at a price which will compete with other meat.

### POTATOES

For some years U. S. farmers have grown more potatoes than consumers would eat at prices profitable to growers and proba-

(Continued on Page 5)

# Right from the start...

**EVERYTHING** right—right from the start. The chicks nice and comfortable in a warm, draft-free house, started right on a good efficient feed and a sound feeding plan. There's more than one good way to feed baby chicks, of course, but here's the way that has proved right on more Northeast farms than any other:

**FIRST DAY:** G.L.F. Chick Scratch and G.L.F. Granite Grit scattered on newspapers or egg case flats.

**SECOND DAY:** Sprinkle the Chick Scratch and Granite Grit on top of G.L.F. Chick Starter about noon the second day.

**THIRD DAY:** G.L.F. Chick Starter in small feeders and Granite Grit in a separate hopper. Continue this system, with feed always available to the chicks, until chicks are six weeks old.

**AT SIX WEEKS:** Regular size scratch grain can be fed along with G.L.F. Chick Starter and increased until birds are eating all they want.

About 17 million chicks were successfully raised last year on G.L.F. high energy Chick Starter. Because of new discoveries by poultry nutritionists, this year's G.L.F. Chick Starter is further improved by the addition of an antibiotic supplement. The new G.L.F. Chick Starter will give even faster early growth and improve bird health.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

**FOR THE BEST CHICKS  
YOU EVER HAD . . USE**

**G.L.F. Chick Starter**

# Four-H Champions

The Northeast may well be proud of the large number of its young citizens whose 4-H work was so outstanding that it won for them free trips to Chicago and individual college scholarships of \$300.

Young people from all over the United States converged on Chicago last month for the annual 4-H Club Congress and were honored by educators, government representatives and commercial firms on tours and at breakfasts, luncheons and banquets.

The commercial organizations, many of them closely affiliated with agriculture, made possible many of the trips and presented outstanding youths with many thousands of dollars worth of scholarships.

AMERICAN AGRICULTURIST offers its congratulations to the young people bringing more farm honors to the Northeast; to the extension service workers for some of the great programs they are carrying on; and to industry for its generosity in encouraging our rural youth.

## New York Winners

At left, first row: Joseph Fisher, Canastota, N. Y., winner of the National 4-H Dairy Achievement Program. Scholarship given by American Cyanamid Company. Myra Flanagan, Winthrop, N. Y., a National winner in the 4-H Dairy Foods Demonstration Contest. Scholarship given by the Carnation Company.

Second row: Vivian Fulton, Canton, N. Y., the winner in the 4-H Farm and Safety Program. Scholarship by General Motors. John Milks, Cattaraugus, N. Y., winner in a Field Crop Program. Scholarship provided by International Harvester Company.

Third row: Richard Bablarz, Auburn, N. Y., a winner in the 4-H Home Grounds Beautification Program. Prize given by Mrs. Charles Walgreen of Chicago. Norman Phelps, Corfu, N. Y., a winner in the 4-H Poultry Program. Scholarship given by Dearborn Motors Corporation.

Fourth row: George Beyea, Morrisville, N. Y., a winner in the 4-H Tractor Maintenance Program. Scholarship given by several oil companies. Bruce Ketch, Bath, N. Y., a winner in the 4-H Soil and Water Conservation. Scholarship by the Firestone Rubber Company.

## Maryland-Jersey Winners

At right, first row: David Buckman, Owings, Md., a winner in the Farm and Home Electric Program. Scholarship provided by the Westinghouse Educational Foundation. Ruth Smith, Little Orleans, Md., a winner in the 4-H Canning Achievement Program. Scholarship given by the Kerr Manufacturing Corporation.

Second row: Judy Messinger, Millers, Md., a winner in the 4-H Clothing Program. Scholarship by Spool Cotton Company. James Smith, Little Orleans, Md., a winner in 4-H Tractor Maintenance.

Third row: Betty Remsberg, Middletown, Md., a winner in 4-H Home Improvement. Scholarship by Sears, Roebuck and Company. Maurice Brown, North East, Md., a winner in 4-H Garden Program. Scholarship by Allis-Chalmers Manufacturing Company.

Fourth row: John Burrier, Union Bridge, Md., a winner in the 4-H Soil and Water Conservation Program. Eleanor Wojciechowski, Granbury, N. J., a winner in the 4-H Food Preparation Program. Scholarship by the Kelvinator Division of the Nash-Kelvinator Corporation. John Stryker, Jr., Neshanic, N. J., a winner in the 4-H Dairy Program, is not shown.

# THE EDITORIAL PAGE

## HAVE YOU A GRANDMA COW?

WRITING IN "Better Rural Life," published by the Rhode Island State College of Agriculture, C. L. Norton tells of a student who looked at the old grandma cow in the College herd of Ayrshires and asked why she was not disposed of because of her age. The student was startled when Mr. Norton told him that she was the most valuable cow in the herd and proved his case by her record of production and her five fine daughters in the herd.

"The most cherished individual in many herds," says Mr. Norton, "is the old cow that may stand at the end of the line of stanchions . . . Statistics show that it requires all the profit made by the average cow the first two years she is in milk to pay the dairyman for raising her. After that she begins to show a return."

As you know, we of AMERICAN AGRICULTURIST have been talking for years about some way of extending the average productive life of the dairy cow. Costs of replacements are enormous, the heaviest costs dairymen have to pay. Millions of dollars would be saved if we could extend the average cow's production during her best years even just one more year.\*

Some dairymen are doing this by better breeding and better care. The first essential is records. The old cow may be the best one in the herd, but you won't know it unless you have kept a record of her production.

## LARGER AND BETTER USE OF FERTILIZERS

AT THIS TIME when almost everything in the way of farm supplies costs so much more than it did even a short time ago, it is interesting to note that a ton of fertilizer of given specifications costs the farmer only 4 or 5 per cent more today than it did 25 years ago. Moreover, the higher quality of fertilizer today means a saving in both freight and handling costs.

One of the big advances in farm practices in recent years is the larger, and especially the wiser, use of fertilizers. Farmers know more than ever before how best to apply them so as not to waste them, and also farmers know that other factors being equal, there is nothing else that they can do that will increase crop yields more than an intelligent use of fertilizers.

## YOUR UNDERSTANDING AND COOPERATION ASKED

AFTER FIVE YEARS as Chancellor of the Board of Regents and of the University of the State of New York, and thirty years as a member of the New York State Board of Regents, William J. Wallin of Yonkers has found it necessary to resign his position as Chancellor in order to devote more time to his law business. He will remain a member of the Board of Regents.

Mr. Wallin has been in public life for a half century. In the unpaid position as Regent and Chancellor he has devoted from one-third to one-half of his personal time to the cause of education and to the young people of the state. Under his leadership, the Board of Regents and the Department of Education have taken a constructive and forward-looking position on teachers' salaries, on the increase of State Aid to education, on enlarging scholarship grants by the State, and on the establishment of technical institutions.

Mr. Wallin will be succeeded as Chancellor by the present Vice Chancellor, John P. Myers of Plattsburg, New York, who is a great leader and a great man, and I have been elected to succeed Mr. Myers as Vice Chancellor.

The Board of Regents and the State Department of Education, in the interests of the children of the state, ask your help, understanding and support in the difficult problems we face in continuing to furnish educational opportunity to young people. We welcome constructive criticism, but not the destruc-

By E. R. Eastman

tive kind that is based on a lack of understanding of what the modern schools are trying to do. So often criticism comes from people who have not attended a school meeting in years, who have never visited a school in session, who do not know that educational policies and methods have changed like everything else in the last five years.

The present Board of Regents and the leaders in the Department of Education are very desirous of putting more and more decisions on school matters and policies up to the local boards of education and the people themselves. We realize that school administration and teaching are by no means perfect, but the schools of New York are among the best in the nation. Many current efforts are being made by the Regents, the Department, local boards, and, last but not least, the teachers, to have the schools do a better job. But they cannot do it without your understanding and help.

## SHEEP ARE COMING BACK

LIKE to read the stories about flocks of sheep moving slowly along the old dirt pikes in the summer time before the railroads were built, on their way to the big city markets. They filled the road from fence to fence and raised a great cloud of dust like the smoke of a big battle.

With the opening of the West, beef cattle and sheep mostly moved out of the eastern states. But history has a habit of repeating itself, and now the beef cattle and the sheep are coming back. The opportunities for profit from sheep in the East are now the best ever. For our armed forces alone, 100 million pounds of wool are required. The Australian wool clip is estimated at \$1,189,000,000, double last year's value and 14 times more than the clip brought in 1938-39.

Sheep now offer real opportunities here in the Northeast, but with that suggestion goes a note of warning. Sheep require special knowledge and care and, above all, a liking for them. The need of good fences and protection from dogs are real problems. But if you recognize these problems, both the present and the permanent outlook for sheep raising are worth considering.

## GRASS IS BETTER THAN HAY

AS A result of recent tests on feeding Holstein steers pasture grasses and hay, the New York State College of Agriculture reports that very young pasture grass is 70 to 80 per cent digestible, and that more mature pasture grass is 60 per cent digestible.

The digestibility of hay varies from 35 to 50 per cent, depending on how mature it is when it is cut and how well it is handled during harvesting.

These tests again emphasize the importance of improved pastures. Every day that you can add to the pasture season and every way that you can improve the quality of the pasture grass add to your dairy profits. Now is the time to do some pasture improvement planning.

## AROOSTOOK TURNING TO MILK AND BEEF

THE SOONER potato growers realize that for the past several years they have been growing more potatoes than consumers will buy or eat, the sooner the potato marketing problem will be solved.

Perhaps because they realize this truth, more than half of the farmers in Aroostook County, Maine, are producing or planning to produce milk or beef in commercial amounts. Only a short time ago, nearly all Aroostook County farmers specialized in potatoes only.

The turn to dairy cows in Aroostook County and in other sections poses more of a marketing problem for dairymen. For example, if the Aroostook

County farmers add 5,000 more dairy cows—which they now plan to do—it might reduce the Boston milk pool price by 3.9¢ a hundredweight, but would add 1½ million dollars a year to the gross farm income of Maine.

Again, if income from beef is estimated at \$150 per cow per year, the increase in the gross farm income of Aroostook from beef would also be approximately 1½ million dollars per year.

## GOING FAST

IF YOU have been thinking about buying a copy of E. R. Eastman's novel, THE SETTLERS, you had better do it soon. Three-fourths of the first edition of 5,000 copies has been sold in about four weeks, and there is no likelihood now that a reprint will be made. We have a large folder of enthusiastic letters from readers of THE SETTLERS. It's really a great book. For a copy, send \$3 to American Agriculturist, Department TS, Savings Bank Building, Ithaca, N. Y., and it will be sent you postpaid.—M.H.

## BE SURE YOUR SHOES FIT

THE Medical Society of Pennsylvania says that proper shoes "should allow for two basic needs—rapid evaporation of perspiration of the feet and dryness in wet weather."

To these requirements I would certainly add the need of the shoe fitting properly. Both men and women on farms have to be on their feet from daylight to dark, and the number of farm folks who have injured or crippled feet because of wrong footgear is legion. Nothing tires one more quickly than a sore or aching foot. Nothing in the way of health is more important than a properly fitting shoe, and this is particularly important when buying shoes for children.

## GOOD TREES ARE DISAPPEARING

CAN YOU imagine this Northeast farm country of ours without either the maple or the elm tree? In the farm valley where I grew up, there was a maple grove on every farm. Now they are nearly all gone. Around my farm home and along the road where I now live are several fine maples, but they are old and will not last many years more. Most of the elm trees are old, too, and they have a deadly enemy, the Dutch elm disease. The chestnut is gone. Will the elm and maple follow?

The answer to this real problem is to plant more young trees every spring.

## EASTMAN'S CHESTNUT

OLD MATT IRONFIELD, who had run the only hardware store in Slopeville for the past thirty years, was sitting himself down to the supper table when his patient wife, Esmeralda, said: "Any business today, Matt?"

"Oh, old Bull's-Eye Benson came in and bought a padlock for his meat cellar this mornin'."

"Anything else happen?" asked his wife.

"Oh, a little later on, Light-Fingered Fenwick come back and bought a skillet—big enough to fry a big slice of ham in."

"I see," said Esmeralda. "Any other customers?"

"Oh, along the middle of the afternoon, Bull's-Eye Benson come in and bought a box of 30-40 cartridges for his old rifle."

"And that was the extent of your day's business?" his wife asked.

"Nope," he said, buttering a biscuit. "Later on, Light-Fingered's two cousins, Jake and Joe, come in and bought a pick and a spade—and some spikes to nail a pine plank box together with."

"Well, well," said Esmeralda. "And then did Bull's-Eye Benson come back and buy another padlock for his meat cellar?"

"Nope," Matt said, heaping a mound of jelly on his biscuit. "Don't reckon he'll need to keep it locked now . . . . . Mighty fine biscuits, Esmeralda."

# The 1951 Farm Outlook

(Continued from Page 1)

bly more than they would have eaten at present wage levels had the potatoes been given to them. Now potato growers are on their own without price supports and somebody must cut production. Under the controls accompanying price supports, many good potato growers were forced to cut acreage so low that their efficiency was impaired. Because growers in some areas have sold most of their production to the government, markets have been lost. Every grower can well do a lot of thinking about the acreage to plant.

Predictions as to what will happen in 1951 vary. I have talked with some who believe the mess accompanying price supports will be corrected rapidly. Others think it may take a year or two, but eventually, and we hope soon, potato production and marketing will "shake down" and be a far healthier business than it was under supports and controls.

## Fruit

Production costs per unit on fruit have not dropped as rapidly as they have on most farm products. There has been considerable success in mechanizing the fruit production job except when it comes to picking. But to offset the labor-saving mechanization of certain jobs, the cost of spraying has risen steadily as pests have multiplied thus requiring a larger number of sprays.

In recent years a larger percentage of the apple crop has been taken by processors. In some areas, for example western New York, growers have cooperated effectively in marketing their crop to processors. However, as we have watched the apple growers who seem most successful, it appeared that they have produced a quality product and developed a special market for it.

The 1950 apple crop was good quality. The important thing to do now is to move it into consumers' hands gradually and steadily as the demand will absorb it, meanwhile following all practices that help to maintain quality. Financial support given to the New York-New England Apple Institute is likely to be returned with dividends in coming years.

*Because we have had two consecutive years of big apple crops, the 1951 crop is likely to be smaller and prices better.*

## Vegetables

1950 was a poor year for vegetable growers. Unfavorable weather hit some

crops. Prices on others, for example onions, were low. The production of vegetables for the fresh market has always been somewhat of a gamble with prices depending on immediate supply and demand. Always the man who can beat his neighbor in getting a product on the market early reaps a good reward.

Growers of crops for processing are protected to some extent by contracts, but they are subject to the dangers of increased production costs between the time they sign the contract and deliver the produce. As our armed forces increase, the demand for canned and frozen vegetables will of course, increase.

Here are some general farm management suggestions to keep in mind:

### 1. Keep Debts Manageable.

If your debts are heavy, transfer short time obligations to long term mortgage debts if possible. If your mortgage payments are based on high farm income, try refinancing on a longer basis and with smaller required payments, *but with the privilege of making larger payments if you wish.*

### 2. Be Reasonably Conservative.

The government will push for high food production but farmers need to understand how the present situation differs from 1941. Then industrial production was low, and defense preparations did not immediately cut into the production of goods for consumers. Now industrial production is at capacity. Furthermore costs are on a higher level as are taxes. Aim for full production but not forced production, unless, of course, total war.

### 3. Anticipate Supply Needs.

Get fertilizer, spray materials, seed, needed equipment and repair parts bought and delivered early. Keep a good supply of feed on hand. Supplies are not expected to be drastically short but they are unlikely to be cheaper and, later, you might be unable to get them on short notice.

### 4. Watch Your Labor Supply.

Many farm boys are sure to be drafted. Others will be tempted by high wages to work in industry. A good tenant house often helps to keep a good man. Use labor-saving methods where possible.

### 5. Control Costs Where Possible.

The cost of production per can of milk or per bushel of wheat is lowered by high production. Use fertilizer liberally. Buy the best seed and baby

Entrance to the 60-acre Beacon Poultry Research Farm.

**Now AVAILABLE with NITROSAL**  
(On Order)

Faster growth, sturdier growth—better fleshing and feathering, fewer barebacks—strong bones and bodies—developed during those important first 8 weeks by Beacon Complete Starter . . . Because Beacon Complete Starter is a *high efficiency feed*. Has high protein, low fibre and high energy content, and for the past year, it has contained a Vitamin B12 and anti-biotic supplement for greater efficiency, faster growth. On special order, it has been available fortified with an anti-coccidiosis drug.

## RESEARCH MAKES THE DIFFERENCE

The tested, proved basic formula of Beacon Complete Starter results from 29 years of painstaking research. Our experiments to date have shown that with the Nitrosal feed we get faster growth, higher feed efficiency, better pigmentation on skin and legs and greater uniformity in the flock. More than 80,000 birds are involved in these experiments, which are being continued.

## AFTER BEACON STARTER . . .

Reach for the ★ ★ ★ STARS\* at your Beacon Dealer's. Consult your classified telephone directory for the name of your nearest Beacon Dealer. \*Green stars on Sulfaquinoxaline and Nitrosal Feed Bags.

Keep right on choosing the star spangled Beacon bags and the research-developed feed they contain. For BROILERS switch to Beacon Broiler Feed at the end of 4 weeks—for future LAYERS add grain at the end of 6 weeks—then use the economical Beacon 70/30 Feeding Plan after 12 weeks or—after 6 weeks on Starter—use Beacon Grower All-Mash.

### MATCH BEACON STARTER'S RECORD (IF YOU CAN) . . .

The record shows that many Beacon feeders average less than 3 pounds of feed per pound of meat at weights of 4 lbs. or over per bird (9 to 12 weeks). Match Beacon Complete Starter for results with any other starter on the market.

## The Song of the Lazy Farmer

he has no worry and no care. The only labor that it takes is now and then I've got to wake and put a new log on the fire; but that ain't likely to require much work unless Mirandy should forget to carry in more wood.

I WISH somebody would explain why anyone who's not insane can figure that a house is fit if there's no fireplace in it. Most all new homes I ever see just irritate me terribly; they either have no hearth at all or else there's one that's real small, it's there for people to admire but ain't supposed to hold a fire. I even have some friends who own big fireplaces made of stone which do not make a bit of sense 'cause they're out by the garden fence. When winter winds begin to blow, who wants to sit out in the snow? And when we're having summer heat, nobody needs to warm his feet.

The only kind of fireplace that ain't a plain, downright disgrace is one that's big enough to hold a real fire when it's cold. And there's no place for it to be but in the living-room, by gee. When man's laid up with rheumatiz, the best durn treatment that there is comes from a roaring, snapping blaze that cures the patient while he lays asleep upon a sofa and then

# How to SAVE MONEY and Raise "Milk-fed" Calves

## MONEY-BACK GUARANTEE ON PEEBLES' CALF-KIT

We guarantee you complete satisfaction with the feeding results of Peebles' CALF-KIT when fed to your calves as directed. Feed CALF-KIT for 7 weeks. If you are not convinced that the CALF-KIT program raises better calves than any similar program, give your dealer a written statement as to why you are not satisfied. He will cheerfully refund the full purchase price of the Peebles' CALF-KIT used by you during this feeding test.

WESTERN CONDENSING COMPANY, Appleton, Wis. San Francisco, Calif.

**Save up to 250-500 lbs.  
of milk per calf**

Cut your calf-raising costs 1/3 or more! Have more milk to sell! You can when you use Peebles' CALF-KIT. It replaces milk safely because 98% of the nutrients in Calf-Kit come from milk sources, as contained in whey and whey products. It also supplies plus guaranteed amounts of Vitamins A, D and Riboflavin. CALF-KIT builds big, strong, husky calves with real milk-fed "bloom" and vigor. Try Peebles' CALF-KIT now on a money-back guarantee. See if it doesn't help you raise better calves at less cost than ever before.

## Question Box

I live in New Jersey and would like some advice on how much lime and fertilizer to use for asparagus.

In view of the depth to which this plant roots, getting some lime and fertilizer down deep is certainly advisable.

The New Jersey recommendation for setting new fields is one ton of dolomitic limestone and 1,000 pounds of 20% superphosphate per acre in the bottom of the trench and thoroughly mixed with the soil before the roots are set. On top of this they recommend 1,500 to 2,000 pounds of 5-10-10 broadcast and worked into the soil. Broadcasting and plowing down your lime and superphosphate might not be quite as good as putting it in the bottom of the trench, but it certainly would be more satisfactory than broadcasting it on the surface and merely harrowing it in.

It is true that phosphoric acid in superphosphate applied in this manner will lose some of its availability with time. However, it will not leach away and there will not be a complete loss of availability. There is no way to apply superphosphate that does not result in some loss of availability with time.—George H. Serviss

\* \* \*

I have a flowering quince bush which has now produced some green fruit. Is this fruit okay to use for cooking?

I expect you could use these for quince jelly and other products in which quince are ordinarily employed.

I think, however, that if you are interested in using quince in cooking, etc. that you would be better satisfied with the commercial quince, *Cydonia oblonga*, which is handled by many nurseries, than with the ornamental quince, *Chaenomeles lagenaria* or *Cydonia japonica*. The last name frequently appears in nursery catalogues for the flowering quince.

If you have a fine plant of flowering quince, you might like to cut off some of the branches during the winter season and force them indoors. The blossoms open quickly and easily and the young green leaves are rather interesting in late winter and early spring.—A.M.G. Pridham, N. Y. College of Agriculture.

\* \* \*

What is the best variety of birdsfoot for St. Lawrence County? How much should I seed and what grass should be seeded with it?

Probably the safest variety to seed in St. Lawrence County is the Empire which, as you know, is the New York strain. I did see, this past year, some excellent stands of European that had come through one winter. We need another winter or two, though, before we know just how winter-hardy the European material is. If one was to pass judgment on it at present he would say it was probably better from a hay standpoint than the Empire, but probably not so good from a pasture standpoint.

Five to six pounds of birdsfoot trefoil plus six to eight pounds of timothy are the usual recommendations. In quarts this would be two and one-half to three quarts of trefoil seed plus four to five quarts of timothy seed.

—George H. Serviss

\* \* \*

Where a sub-soil is hard and impervious, will deep-rooted plants such as alfalfa soften it up and improve drainage?

This matter of hard sub-soil is particularly troublesome in parts of New Jersey. Where deep-rooted crops such as alfalfa penetrate the soil, improvement will result, but some soils are so hard that the roots penetrate very little.

**YOU SAVE  
ALL WAYS**

with  
**Armour's**

**HIGH ANALYSIS  
FERTILIZERS**

**3 bags = 4 or more**

High Analysis means more plant food units per bag—three bags do the work of four or more. Money saved on High Analysis lowers production costs, increases your income.

Armour's High Analysis saves on transportation, requires less storage space. And "Big Crop" on the bag means the right balance of plant food elements and minerals.

High Analysis saves you time and labor in handling, hauling, loading and applying. It's one of your answers to rising costs and the need for higher production because it saves ALL WAYS.

**ORDER EARLY!**

Be on the safe side. Supplies may be affected by changing world conditions. See your Armour Agent today and order your plant food.

*Improve Your Pastures*

Pastures can be your top money crop. Fertilize with Armour's and make a heavier stand of more nutritious feed that makes extra pounds of milk and meat. Again you save with High Analysis—it takes less to do the same job!

**NEW! SPECIAL!**

**Vertagreen®** Armour's complete, balanced plant food, is now available in a SPECIAL FORMULA for COMMERCIAL CROPS in your section. Ask your Armour Agent about this great product which has already produced outstanding results wherever used.

chicks. Control weeds, insects and crop and animal diseases. Aim for higher production per animal or per acre.

## 6. Write Your Congressman.

Everywhere, people are discussing past diplomatic mistakes. No longer do most citizens assume that "government knows best" either on international or domestic problems. Fortunately Congress seems inclined to reassert its authority and government appointees seem to be looking at current problems more realistically.

Changes for the better are likely to come from Congress which you helped to elect and which you can help to guide. If they have the facts, the combined judgment of thousands of citizens is likely to be correct.

For example, how did we ever come to promise to feed, rehabilitate and defend so many countries — to promise more than we can possibly deliver. If you agree that we did that, tell your congressman that you want a re-examination of our commitments and a firm statement of international policy based on our ability to back it up.

Also, the vital importance of a drastic cut in the government's domestic budget is generally recognized. But who is going to make the cuts? Not Bureau heads and not the President. If it is done, Congress must do it and the more letters they get from their constituents the more likely it is to be done.

*Don't let anyone tell you it can't be done. We are being told that we must tighten our belts. Government agencies must tighten theirs, and particularly they must stop further expansion of costly socialistic schemes. We could not afford them in peace and we constantly cannot afford them when we are facing war.*

A real danger to watch is that so-called "liberals" and "pinks" will do their utmost in the war emergency to slip over more costly, visionary, socialistic schemes on the public.

What happens nationally and internationally affect you, your business and your children and grandchildren. Make your farm plans as wisely as you can but whatever else you do, do not fail to give the time necessary to make Democracy work here in America. To do so is vital both for us and for all free peoples.

Finally, I believe the American farmer and the American public want to know the size of the job ahead. If they are told this frankly and given adequate reasons, they will follow good leadership and do what is needed. They are thoroughly fed up with double talk and half-truths, toned down because of the fear of political effect. Let's have the unvarnished truth, and let's have it now.

Plan now to spend  
**75% less for fuel**  
on every tractor job this year

with a  
**Sheppard  
DIESEL**

$$\frac{1}{2} \times \frac{1}{2} = \frac{1}{4}$$

The Fuel      The Price      The Cost

A Sheppard Diesel's big 75% fuel cost saving will offset the coming increase in overall farm expense. The unbeatable combination of the Sheppard's independent power take-off and eight speed transmission produces full throttle power for power take-off operation at ALL ground speeds. Depressing tractor clutch does not interrupt constant full power on the take-off. This is a big advantage when combining or harvesting heavy crops as tractor can be stopped to allow harvester or combine to clear itself whenever necessary. These interruptions however, are far fewer due to a Sheppard Diesel's steadier power and slower available speeds. Get the facts on the Sheppard Diesel you need . . . mail coupon now.

**18 MODELS . 2 SIZES**  
puts Diesel Power within reach of each and every farmer.

ADJUSTABLE WIDE FRONT AXLE for either SD-2 or SD-3.

ORCHARD AND GROVE MODELS in both power sizes.

matched *Sheppard* implements  
with "Hydra-Lock" implement controls

Sheppard Diesel owners have a wide selection of both front and rear mounted cultivators to meet their individual requirements. Both types are available in 2 or 4 row models . . . can be mounted by one man in a matter of minutes. Sheppard's exclusive "Hydra-Lock" implement control provides swift, positive handling of mounted implements. A full line of pull type implements, all designed with rugged simplicity, offers everything needed for modern, heavy-duty diesel farming.

### FARMALL "M" OWNERS

You, too, can cut fuel costs over 75% by installing a Sheppard 6M Diesel. This engine was specially designed for your tractor . . . can be installed in less than a day without any alterations to frame. Doesn't interfere with your present implements. Check coupon for our special 6M bulletin.

**DIESEL'S THE POWER... SHEPPARD'S THE DIESEL**

Says Harold Tripp of Dryden, N. Y., owner of 30 fine purebred Guerneys:

"I have been feeding Kow-Kare for 35 years. It sure helps in keeping my dairy records up, and is the best thing I know for a faded appetite, or at Calving time. Tip-top condition means dollars and cents in production and breeding purebreds."

Off-feed cows can never cope with high-cost feeds, and return a profit on feed and housing. Harold Tripp doesn't guess or take chances. For 35 years he has known that the Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorus and Vitamin D in Kow-Kare are there for a purpose... to keep hard worked cows in tip-top condition for feed-to-milk conversion, and for trouble-free Calving. At about 2¢ a day you can put Kow-Kare to work in your own dairy. And, how much added milk does it take to make a handsome profit on such a small investment?

THE TWO (C)-A-DAY  
**Build-Up**

#### WHEN COWS FRESHEN

... here is the time of all times when an ounce of prevention pays huge returns in helping cows through their DANGER-MONTH. It's the breakdowns after freshening that send good cows to the butcher. Healthy calving is the cultivation period for efficient lactation to follow. Put concentrated, low-cost Kow-Kare in your feeding program. You'll cheer the results in more milk and lessened worries. All sizes, including the new 50-pound economy drum are at your farm-supply dealers.

The Holstein in this picture produced those 28¼ quarts of milk in a day on a diet that averaged, during her lactation period, 35.8 pounds of top quality hay and 35 pounds of silage. She got no grain during the test at the New Jersey Agricultural College's farm. From left are: Tom Milliman, director of research for G.L.F. which, with the Dairymen's League sponsored the five-year test; Oscar Van Acker, herdsman, and Professors John Kitchen and Carl Bender.

## New Jersey Tests Boost Roughage for Cows

**I**F YOU have roughage so good that your 1,000 pound cows will eat 27.9 pounds of corn silage per day and then top it off with 22.9 pounds of hay, you are one of the fortunate dairymen in a position to cash in on the results of a five-year research program just concluded at the New Jersey Experiment Station at New Brunswick.

Carl Bender of the New Jersey College of Agriculture, who is considered one of the country's leading authorities on grassland farming and dairy nutrition, told me that the five-year test proved that the average milk production in any state can be maintained and, at the same time, grain costs can be cut 50% "if the cows get all the good quality roughage they can eat."

### Raise Your Roughage Sights

Professor Bender, Professor John Kitchen, who heads this research project, and Dr. J. W. Bartlett, head of the College's dairy industry department, agree, however, that there is plenty of work to be done on Northeast farms before there will be anything like an overall 50% savings in grain costs. In the first place, nearly everyone has to get a real understanding of what high quality roughage is. That fed during the barn feeding periods in the New Jersey experiment was all U. S. No. 1 extra green leafy second or third cutting alfalfa hay, and top quality corn silage. In the summer, grass-legume pasture was maintained at a high level of fertility.

To grow such roughage and pasture

—and it is done on more and more Northeast farms every year—and to harvest the crops when they are at the best stage for milk production, a dairyman must fertilize generously, practice painstaking management of his fields, and also be equipped mechanically to handle the crops at just the right time.

The best judge of top quality roughage is the cow. If she'll eat, for each 100 pounds of her body weight, 2.79 pounds of corn silage and then tuck away another 2.29 pounds of hay, you can figure that your roughage is really high quality even in the eyes of the experts. However, if she won't eat that much hay, your quality *might* not be to blame. Some cows just can't consume that much roughage because, in the words of Jack Bartlett, "They haven't been educated to it." He agrees with Bender that dairymen have to develop "hay-burner family lines by starting them on roughage early."

When I asked Dr. Bartlett how early, he replied that they had started some calves on roughage almost immediately after they were born!

Five years ago, through a commercial research grant from the Grange League Federation and the Dairymen's League, the New Jersey Station set up the experiment to study "The Milk Potentials of a Roughage Feeding Program." The study is being continued under sponsorship of the two organizations.

### How the Test was Run

Each spring and fall, the 30 cows assigned to the experiment were divided

(Continued on Page 17)

This chart shows that it is more profitable to feed all roughage only when the price of milk is under \$3.90 a hundred. It also shows that with all the good quality roughage they can eat, cows can produce more profit over feed cost on light grain feeding than on the heavy 1 to 3 ratio, even if milk sells at \$7 a hundred. According to the results of this experiment, the only time the heavy grain feeding would be profitable in an average herd would be when grain cost only \$40 a ton and milk sold for more than \$3.50 a hundred—a price ratio that isn't even remotely possible in the foreseeable future.

# Here's the *Easiest* way – to do the *Hardest* work

## Choose a *McCormick* LOADER and SPREADER

There's no back-breaking work in manure-hauling when you use these McCormick time and labor-savers—the new No. 31 Power Loader and the No. 200 Spreader. Without leaving your Farmall tractor seat you can break loose 4 or 5 huge scoops

full of manure, dump them in the spreader, then hitch on (fits any drawbar), and take off for the field. Instead of a half-hour to an hour of hard, back-bending work with pitchfork and shovel, the entire loading operation has taken only 5 or 6 minutes!

### Check the 8 Features above. They show why the No. 200 Spreader lasts so many years longer

And the No. 200 Spreader is only 37 inches high for easy hand loading . . . its large capacity makes it ideal for the average to large dairy and livestock farmer . . . it spreads a wide, uniform blanket of shredded manure—from wet bedding to the toughest chunks—at any rate you want from 5 to 25 loads an acre and its accurate load balance, when hitched to your tractor, gives you close turning in feed-lot, barn, or field.

The full line of McCormick Spreaders includes 4 others—all as ruggedly built as the sturdy No. 200—designed to fit the varying needs of feeders and dairymen. These are:

**No. 200-F.** 75 bu. Designed for the dairyman, to handle liquid manure.

**No. 200-H.** 65 bu. Four-wheel, for horse or tractor power.

**No. 100.** 40 bu. For small tractors or for minimum spreading requirements.

**No. 100-H.** 40 bu. Three-wheel, for horse or tractor power.

Equip your Farmall H, M, or MD Tractor with the New McCormick No. 31 Power Loader, and make these tough jobs easy; scoop all kinds of grain, sand, earth, and snow; build and maintain roads, terraces, dams, and runways; dig drainage ditches; fill gullies.

Then, too, you can lift and move feed bunks, hog and poultry houses, motor assemblies, baled hay; clean and maintain feed lots; doze out stumps and stones; drive and pull fence posts; do many other tough, back-breaking jobs from your tractor seat!

See this rugged line of spreaders, see the work-saving No. 31 Power Loader, and examine world-famous Farmall Tractors at your IH dealer. International Harvester Company, Chicago 1, Illinois.

## INTERNATIONAL HARVESTER

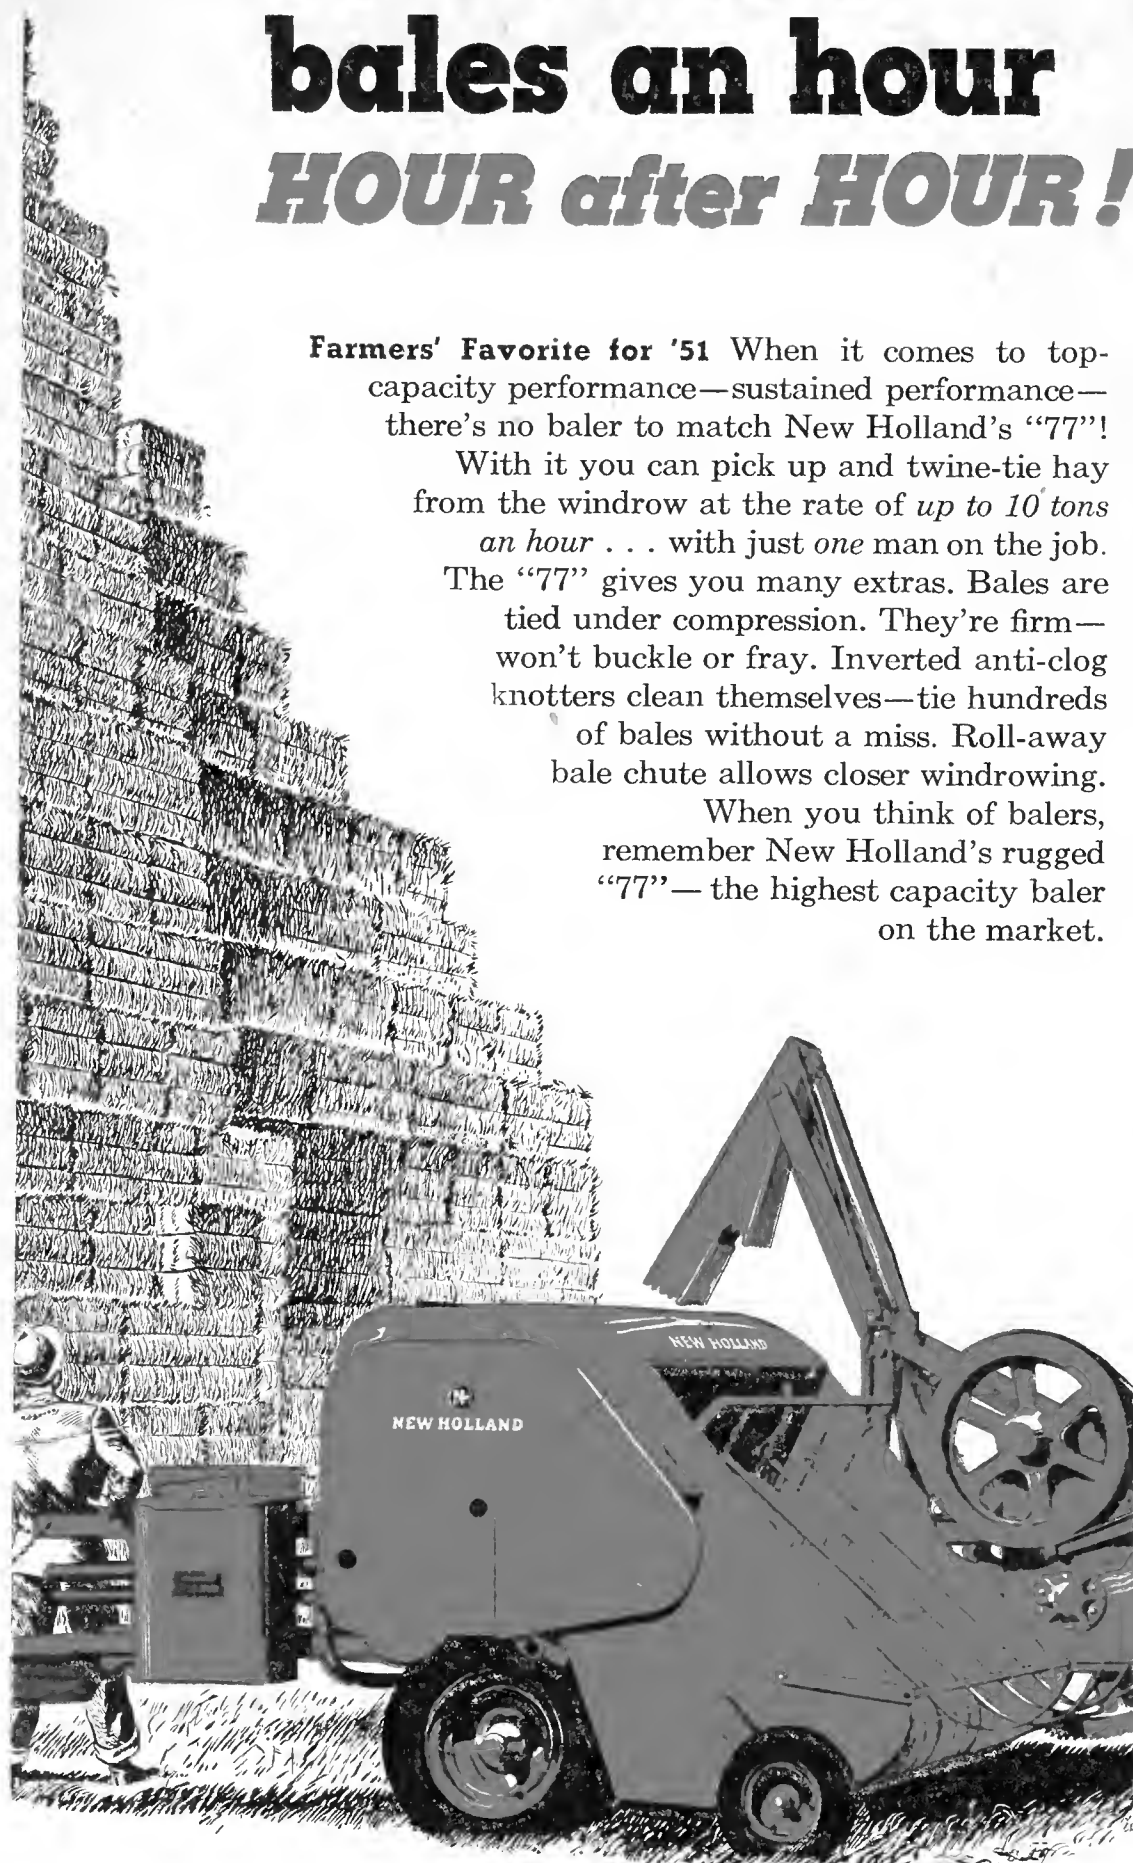

# 350 to 400 bales an hour *HOUR after HOUR!*

**Farmers' Favorite for '51** When it comes to top-capacity performance—sustained performance—there's no baler to match New Holland's "77"!

With it you can pick up and twine-tie hay from the windrow at the rate of *up to 10 tons an hour* . . . with just *one man* on the job.

The "77" gives you many extras. Bales are tied under compression. They're firm—won't buckle or fray. Inverted anti-clog knotters clean themselves—tie hundreds of bales without a miss. Roll-away bale chute allows closer windrowing.

When you think of balers, remember New Holland's rugged "77"—the highest capacity baler on the market.

## New Holland Certified Twine

The United States Testing Co. has awarded its Seal of Approval to New Holland for meeting its rigid standards of uniformity, quality and strength. Farmers everywhere agree: there's no better twine at any price.

If you're thinking of buying a New Holland baler, don't wait, order it *now*. You won't make a mistake—and you'll be sure to have it when haying starts.

## Northeastern Viewpoint Grows At AFBF Convention

By L. B. SKEFFINGTON

**S**HADES of Ed Babcock! Remember when he used to write in the A.A. urging the American Farm Bureau Federation to "go right." I seem to remember that in the Northeast in the late '30's there was agitation for the state Farm Bureau federations to pull away from the AFBF and set up their own organization. Point is, there was a strong division of sentiment about farm programs, government subsidies and such things.

Finally, the decision was to stick with the national organization and work within it for a farm program that would maintain freedom of decision for farmers and bear down upon government control of agriculture from Washington.

I went to the AFBF convention at Dallas, saw and heard the delegates adopt a program that included about everything we in the Northeast had advocated.

### Should Be Suspended

A matter of interest was what the federation would do about price supports and controls. Without a murmur of dissent, it was voted that: "In the year ahead the emphasis will be on increased production and farm prices will be supported by the firm demand of a mobilizing economy. Under such conditions the need for price supports, acreage allotments and marketing quotas of certain commodities is greatly reduced.

"We believe that such programs should be suspended, as the law provides and as conditions permit, but will insist that they be reactivated whenever the need for this type of program reappears."

### New York's Stand

It will be remembered that the long-time position of the New York federation has been that supports at a high percentage of parity invite trouble for the farmer—when they are not needed. The federation has repeatedly declared that such supports should be at a figure that would not make it profitable for efficient farmers to produce surplus for the government to take over. Also, that the ideal type of support program was one that could be used to protect farmers from disastrous upheavals or insure maximum production of needed commodities.

In essence, that is what the American Farm Bureau now demands.

Warren Hawley of New York and Herb Voorhees worked on the resolutions committee. Several pages of proposals on adjustment programs were boiled down to a few simple paragraphs. The attitude seemed to be that now is a good time for farmers to get out from under control programs of doubtful value.

### Oppose Ceilings

During the convention it was indicated that Washington was considering price ceilings. Allan Kline, AFBF president, wired the President that such controls would hamper all-out production. The delegates voted that "inflation cannot be stopped by price, wage and ration controls. They interfere with production, impair the flexibility of our economy, reduce capacity to expand output, require huge administrative staffs and invite black markets . . . Premature adoption of such controls could strangle our economy.

"American farmers have demonstrated their ability to produce. We insist that we be given opportunity to demonstrate our productive capacity without controls. If total war forces the application of price and wage ceilings, we will insist that they be applied on an across-the-board basis."

Sighting a struggle of "long duration," the federation pledged that farmers would cooperate to the limit and asked no special consideration.

The Brannan Plan was not even mentioned. Sentiment seemed to be that it was dead. Roger Fleming, AFBF secretary, said that "Secretary Brannan does not speak for farmers . . . is not much interested in development of free farmer organizations."

New York took a stand against a quota system for potatoes. Harold Simonson said at a commodity conference that growers "may be in a precarious position for a year or two, but we prefer to go on our own and pick up the loose ends."

A North Carolina delegate plugged for a resolution that would have committed the federation to work for a quota program. There was divided sentiment. It was made clear that in 1951 there is to be no support program for potatoes unless Congress changes its mind.

It was decided finally that an effort will be made to obtain the views of the potato industry through representatives named from the various regions. If they develop any united program federation directors will be asked to see that it gets consideration. Unofficial sentiment appeared to be that the matter was dead, except that those areas which so choose may have marketing agreements.

Dean William I. Myers of Cornell urged a program that would reduce consumer spending to the level of available goods and to "reduce sharply defensible non-defense spending by government." The federation went all out for this and urged a pay-as-we-go taxation policy, longer work week and emphasis upon both farm and non-farm production.

\* \* \*

### Milk Formula Out

The proposed Class 1 milk-pricing formula for the Rochester market will not become effective this month, as the Producers' Bargaining Agency proposed. Commissioner DuMond has announced that it requires further study. However, he did approve a floor provision that would maintain a \$5.80 price through the first four months of the year.

The formula has been under study by producer committees for nearly two years. It varies somewhat from the New York and Boston formulas. The price would be determined by three moving factors: Supply and demand, consumer purchasing power, and farm production costs. Tables prepared by the agency indicated that had the formula been in force during the past few years there would have been little variation from current prices. Advantage claimed for the formula is that it will eliminate necessity for and delays of hearings. However, it is admitted that so far the Commissioner has acted promptly.

\* \* \*

### Corn Still Out

Snow and freezing weather caught many upstate farmers with corn unpicked. About the time they were ready to pick there was a long period of rain and soft ground. Then came the big blow, knocking a lot of it down. Freezing followed with snow. Some of the corn may have to be picked by hand.

\* \* \*

### Apple Group Effective

In a season when the apple market has not been too strong so far, Western New York growers feel they did very well on sales to processors. Considerable credit is given to their new association.

# More Meat for More Millions

"America may need 25% to 30% more meat by 1960!" Agricultural leaders foresee the need of perhaps 6½ billion additional pounds of meat to feed our steadily growing population. For another ten years may see 170 million mouths to feed. And every day more Americans realize the value of more meat in their diet. Within ten years, per capita consumption may reach 170 pounds per year . . . compared with 145 pounds in 1950.

Where will all this additional meat come from? Fortunately, a number of recent developments may provide the answer. Modern range and farm management, and soil conservation practices, point to more grass and more livestock. Improved varieties of grasses and legumes mean greater livestock carrying capacity. Then you have hybrid corn and other new high-yielding grains. All these make more feed for more livestock.

And recent advances in *animal nutrition* point the way to *more meat pounds from our available feeds*. It isn't so long ago that hogs took a year to eighteen months to reach market weights . . . today it's five to six months. Rations balanced with proteins, minerals and vitamins are largely responsible. Similarly, producers of beef, lamb, poultry, eggs and milk have speeded production by scientific feeding. Very recent discoveries, such as A. P. F. (vitamin B<sub>12</sub>), aureomycin, streptomycin, terramycin and other "wonder growth stimulants" help produce more meat from less feed.

Still other factors such as breed improvement, better control of livestock diseases and parasites, reduction of losses in shipping and from injuries, all add up to the possibility of more meat for America's tables. All these are modern aids toward increased production. Yet, even with all these aids, the very *size* of the job to be done challenges all of us in the livestock-meat industry.

## Soda Bill Sez . . .

A man buried in work is usually very much alive.  
If you wake up famous, you haven't been asleep too long.

## Our Job

If all folks lived where meat grows best,  
Say, somewhere far out in the West,  
They might all raise steers, lambs and swine  
For their own meat at dinnertime.

But it's a thousand miles and more  
From grazing lands to retail store,  
From places where the livestock rove  
To where meat's cooking on the stove.

Millions of head must become meat—  
The kinds and cuts folks want to eat—  
Must reach them fresh and tasty, too . . .  
Those are jobs for us to do.  
So, like you, Swift works late and long  
To keep our nation well and strong.

## OUR CITY COUSIN

"You say  
it's a quarter horse?  
It should be  
worth more,"  
Says sharp  
City Cousin.  
"Here's a dollar  
for four!"

## Swift & Company is People

In addition to being a business corporation, Swift & Company is *people*—64,300 folks like you and me who have pooled their savings to build a business. These savings are invested in plants and equipment, in livestock and other raw materials, and in all the many things that make up Swift & Company.

Without people there could be no business, no Swift & Company. There must be people (shareholders) to supply the capital; other people (farmers and ranchers) to supply the raw materials; the 75,000 people (employees) who handle the company's business; and the millions of consumers who buy the meat and other products.

The success of a business enterprise depends on how these various groups of people get along together. In other words, the owners of Swift & Company and livestock producers, employees, and the company's customers have *got* to get along together on a basis of being good neighbors.

The management of Swift & Company recognizes all these responsibilities to those various groups of people who, together, make our business. It is to *their* interest also that we manage our business efficiently, that we earn a sufficient profit to let us continue contributing to the well-being of more and more people.

F. M. Simpson.

Agricultural Res. Dept.

## Martha Logan's Recipe for INDIVIDUAL SWISS STEAKS

Yield: 6 to 8 servings

3 to 4 pounds Beef Round Steak ½ cup fat  
(cut 2 inches thick) 2 onions  
Salt, pepper 2 cups cooked tomatoes  
1 cup flour or tomato juice

Cut meat into circles or squares 3 inches in diameter. Season the steaks and place on a well-floured cutting board. Cover with flour and pound with a meat hammer or edge of heavy saucer. Continue to turn, flour and pound meat until all flour is taken up by the steaks. Brown sliced onions in hot fat in a heavy frying pan. Remove onions. Brown steak on both sides in fat. Place onions on top. Add tomatoes (or 2 cups water and 2 tablespoons vinegar or catsup). Cover and cook slowly or bake in a moderate oven (350° F.) 2½ or 3 hours.

## Quote of the Month

The livestock industry is providing a most essential part in human existence. It is taking water, grass and grain—and moulding it into a food that is vital to mankind. It is providing meat for a growing population and an armed mobilization.

Livestock is big business—but the bigness not only stems from the dollars but from the fact that the livestock industry is essential to this nation and to its livelihood.

Willard Simms, Editor, THE RECORD STOCKMAN

## "WHY DO

## LIVESTOCK PRICES FLUCTUATE?"

We've been asked that question numberless times. It's a puzzler to thousands of livestock people. So we prepared a leaflet to answer it clearly, with illustrations to make it easy to understand—and mailed it to all persons on our mailing list. So many asked us for copies for friends, or for group discussions, that we decided to offer it here, *free* to whoever wants it—as many copies as you can use. Address your request to F. M. Simpson, Swift & Company, Chicago 9, Ill.

## Cropping Systems Change Farm "Sizes"

by Professor F. C. Bauer  
Department of Agronomy  
University of Illinois, Urbana

F. C. Bauer

Farm boundaries tend to remain unchanged over long periods of time. "Productivity boundaries," however, are constantly changing. The extent of these changes may be very large as revealed by the Morrow plots, America's oldest soil experiment field, established on the University of Illinois campus 75 years ago.

Measured by net returns, one Morrow plot is now only 27 percent as productive as it was in the beginning. A second plot has not changed. A third plot is 32 percent more productive. If these plots had been 100-acre farms, the physical boundaries would remain unchanged. The "productive sizes" of them, however, would be different. In terms of the original productivity they would now be equivalent to 27, 100, and 132 acre farms respectively. These highly significant differences are due largely to the effects of cropping systems on soil structure and nutrient supplies.

Such data emphasize the need for care in planning systems of farming. The Morrow plots point the way to such systems. Some of the more important principles revealed are: 1) avoid the excessive use of row crops; 2) use balanced crop rotations; 3) center cropping systems around deep-rooted legumes; stand-over legumes are more efficient than green manure legumes; 4) keep enough of the farm in deep-rooted legumes and handle them in such ways as to insure a sustained productivity and conservation; 5) apply mineral nutrients needed to insure successful stands of the legume crops.

EDITOR'S NOTE: While it is recognized that the above article deals with the fertility of cultivated land, still the principles which Dr. Bauer presents seem to us to apply equally to range lands in all parts of the United States. For that reason we are happy to present it here as a matter of interest to all livestock producers.

## Swift & Company

UNION STOCK YARDS, CHICAGO 9, ILLINOIS

*Nutrition is our business—and yours*

# PROGRESS THROUGH COOPERATION

## Looking Backward on a Year of Achievement

## And Forward to a Year of Promise...

Nineteen-fifty was a fateful year for the milkshed's dairy farmers. It posed one of the greatest challenges to their marketing machinery that they have faced since World War I. And it proved once more that the dairy farmer's surest friend and most reliable safeguard in times of economic stress is his marketing cooperative.

**DAIRYMEN'S LEAGUE**

*Cooperative*

**ASSOCIATION, INC.**

Month after month at the start of the year, production figures reached new highs. An enormous flood of surplus milk threatened the market. Price was flared up. Producers' returns dropped. Some dealers refused milk.

### Dangerous Price Situation Checked

At the very outset of the year, the League's detailed knowledge of the dairymen's needs and costs checked a dangerous price situation from developing. Facts and figures presented to the Department of Agriculture in Washington convinced officials that the new Class I-A formula would not adequately cover production costs during the early months. As a result, a price floor was granted which yielded dairymen \$3,267,000.00 more than they would have otherwise received.

### League's Brake on Distress Milk Was Year's High Spot

But the really high spot of the year—the fact of greatest service to dairymen in 1950, as well as of brightest promise for the years to come—was the ability of the League to keep distress milk from overwhelming the market. That called for every piece of equipment and every bit of knowledge that the League has accumulated over the years. But it was effective. Distress milk did not get into the hands of price cutters in quantity sufficient to disturb the market.

There was no secret about the method used. It was simply a matter of having the resources, equipment and organization to divert fluid milk into manufacturing plants, and to absorb the trans-shipping costs in order to sell the manufactured products at a competitive price. The League spent \$1,250,000.00 in adjusting its operations to meet the crisis, but it saved members and other dairymen from losses that might have totaled many times that figure.

The experience holds out a promise for the year to come. Whatever the new year may hold, the facilities and organization of the Dairymen's League stand ready for effective action in the best interests of all dairymen in the milkshed.

### Other League Services to Dairymen Throughout the Year

During the fiscal year ending March 30, 1950, the League handled 2,875,674,578 pounds of milk, or 354,714,154 pounds more than the previous year. In only three other years of the Association's history has it been called upon to market a larger volume of milk.

The Dairymen's League introduced a new, convenient five-pound carton of salt butter, designed to increase the sale of butter per customer.

Dairymen's League News survey revealed that the dairy industry is negligently lax in promoting the sale of fluid milk and cream, ranking far below the efforts of soft drinks, brewery and distillery products.

T. W. Greenway, Dairymen's League sales manager, accepted an appointment by Senator Austin W. Erwin on the New York City Advisory Committee in an effort to seek out specific ways of reducing processing and distributing costs in the world's largest milk market.

The Dairymen's League launched a television advertising program in Buffalo designed to increase the consumption of milk.

The Dairymen's League sponsored a radio advertising program from one of New York City's famous restaurants, featuring noted newspaper men and other celebrities, and selling the merits of Dairylea milk.

An arrangement with 48 New York City dairy stores opened a market for cheddar cheese, cottage cheese, sour and sweet cream, and non-fat milk solids in the League's drive to increase the sale of manufactured dairy products.

Frank B. Lent, attorney for the Dairymen's League argued as a "friend of the court" in an action before the Federal Court in Brooklyn which sought to test the validity of the New York federal-state milk marketing order in protecting producers from "cut price milk" imported from other markets.

As a result of intervention in behalf of dairy farmers by the Dairymen's League, milkshed dairymen received prices higher than the Class I-A formula as follows: In March 31c per cwt higher; in April 35c per cwt higher; in May 39c per cwt higher; in June 13c per cwt higher; and July 4c per cwt higher.

Television, newest and most spectacular advertising medium was used by the League in weekly 30-minute telecasts to the New York metropolitan district, featuring Dairylea milk and Paul Whiteman's TV Teen Club program.

The new Elmira plant of the Dairymen's League was opened September 25 with a 4-day open house event to which members, public officials and the general public were invited.

First of its kind in the United States, a new machine which packaged Dairylea ice cream in miniature cube-shaped containers for individual, on-the-spot consumption was shown to crowds at the New York State Fair. The machine was bought for general manufacturing purposes at the League's Utica, N. Y., ice cream plant.

The Dairymen's League entered the Pennsylvania retail milk market for the first time, when it acquired the Matuella Dairy plant of Hazleton on October 1. This was another move by the Association to expand retail outlets for its members and to carry milk directly from the producer to the consumer.

On October 15, New Jersey milk producers secured a price increase of 22c bringing the Class I-A fluid price to \$5.87 per cwt, the price that had been asked for by the Dairymen's League.

Plans for a dual-equipped receiving room, which will speed up milk handling and almost double the handling capacity of the Dairymen's League branch in Buffalo have been approved by the Association's Board Directors. When completed, the plant will be the largest direct-delivery receiving plant operating under League ownership.

Exemption of milk from price controls under the Defense Production Act of 1950 was achieved largely through efforts of the Dairymen's League working with other producer groups in the National Milk Producers Association.

League membership was praised highly in letters from doctors and dentists for the resolution adopted at the annual meeting condemning compulsory health insurance and any system of political medicine under bureaucratic control.

Five years of intensive experimentation at Rutgers University to establish the relative value of roughage and grain in a profitable cow feeding program was financed in part by the Dairymen's League. The first public report of the results of the experiment was made in the Dairymen's League News.

# NEWS! about a revolutionary new FIELD CORN HYBRID

developed in the Northeast  
for Northeastern Growers

## ROBSON "320"

### 320

- 1 BETTER ENSILAGE
- 2 HIGH GRAIN QUALITY
- 3 BETTER STANDABILITY
- 4 DISEASE RESISTANT
- 5 BEST FOR SHOCKING
- 6 SEASON between Wisconsin 35-5 and Cornell 29-3.

### 320

After years of carefully selecting breeding material under the same conditions that our farmers grow their corn, we have succeeded in producing a new field corn hybrid superior to any other hybrids now being grown on New York dairy farms. Match ROBSON "320" this year against hybrids you have been growing.

## Winter Management for POTATO STORAGES

By E. W. FOSS

**A**FTER the fall "cooling off" period has successfully brought the potato storage and its load of potatoes down to the 38° to 40° level, it becomes the operator's job to maintain that temperature through the winter. During the period of storage, the operator's management may cause the potatoes to shrink a minimum amount, or considerable. Heavy shrinkage will result in a poor quality product, both for eating and seed purposes.

Potatoes should be kept at an unvarying temperature — preferably at 38° to 40° F. Several factors and practices tend to work against this.

1. Dirt dumped in with the potatoes restricts the flow of air through the pile.
2. Large bins of potatoes generate considerable heat which tends to warm up the upper portion of the bin more than the other sections.
3. Cold exterior walls tend to cool off the outside areas of the bin.
4. When potatoes are being loaded out, the open doors tend to cool off the building.
5. During the grading operation workers often build a fire to be comfortable while working.

The symptoms or signs of uneven temperature often do not show up until Spring, but they are as follows:

1. Rotten potatoes found amidst the dirt in the center of the bin.
2. Early sprouting and shriveling — particularly at the tops of the bins.
3. Moisture accumulation at the top of the bin during particularly cold periods.
4. Frozen, "sweet," or low vitality seed potatoes from around the outside wall areas of the bins or near the loading doors or "roll-way."

What can I do to maintain the correct temperature?

To a considerable degree the quality and design of the storage must be correct to insure freedom from the symptoms mentioned above. Only in a well designed house with automatic air circulating and ventilating equipment installed can the management factors be reduced to the minimum. If you hereby resolve to do something about it before next year, there are bulletins to assist you.

I've got potatoes in this old house now! What would you suggest for this winter?

1. Keep your doors shut as much as possible during loading operations.
2. Use no heat or as little as possible during grading. In many states your insurance cost is less if there is no stove in the house—and in the Northeast no correctly designed house needs heat unless it is but partially filled. Many houses in Ft. Kent, Maine (can you think of any place colder) now use no heat.
3. Keep the air circulating within the house either all of the time or periodically. Storage temperatures tend to become a degree warmer for every foot difference in height. With shallow bins of five or six feet this makes little difference, but with some storages ten to fifteen feet deep this can, and often does, cause trouble.

Portable fans installed at the corners of the bins farthest from the loading doors will force the warm air over the bins toward the colder

roll-way. In a well designed house the fans would be built in. By utilizing wall and floor flues, air could be kept moving completely around the bin.

4. If the bins have never been levelled off and moisture is accumulating on "the hump,"—do level the bin now. Air from fans passing over the potatoes will reduce this moisture. Moisture will not form on the ceiling if the insulation is adequate, the air is circulated, and the temperature of the bin is at 38° or 40°. (A bin full of dirt will overheat because air can not get through it.)
5. If the temperature of the whole storage creeps up, the air must be ventilated outdoors to remove the heat. Do this only when the outside temperature is not lower than 20° F. or for short intervals if the temperature is lower. The outgoing warm air will be replaced by the incoming colder air. Air too cold will cause freezing, unless it is mixed in with the storage air. Don't forget that though you may reduce the air temperature in the storage from, say, 45° to 40° in an hour or so, it will take much longer to reduce the bin temperature of the potatoes. It will take over 500 cubic feet of 20° air to cool down one bushel of potatoes from 45° to 40°, provided the whole exchange was 100% efficient. To cool off the whole storage requires thousands or perhaps millions of cubic feet of air.

Lastly, after you have used the best seed, the correct fertilizer and spray materials, plus hours of labor to grow a good crop, do spend minutes of time to manage your storage correctly. A thermometer placed in several locations around your storage will show you that you are 100% safe. Don't guess or wait for the pail of water to freeze on the floor. A peck, bushel, 50 or 100 lb. sack of good potatoes will help to sell another one. Make your storage assist you in the sale of top quality stock.

—A.A.—

## TEN HELPS IN MARKETING WOODLAND PRODUCTS

1. Get a reliable estimate of the amount and value of the timber to be sold. If necessary get experienced help. Know what you want to sell.

2. Before selling, consult neighbors who have sold timber, and benefit from their experiences.

3. Investigate local timber requirements and prices. Your products may be worth more locally because transportation is saved.

4. Get prices for various wood products from as many sawmills and other wood-using plants as possible.

5. Advertise in papers and otherwise secure outside competition.

6. Secure bid, if practicable, both by the lump and by log-scale or other unit measure.

7. Be sure that you are selling to responsible purchasers.

8. Market the higher grades of timber and use the cheaper for farm purposes.

9. Remember that standing timber can wait over a period of low prices without rapid deterioration.

10. Use a written agreement in selling timber, especially if the cutting is to be done by the purchaser.

—Norman Scheuler, W. Y.

## On Coldest Days — Work In COMFORT

**NEW WINDSHIELD EXTENSIONS**—optional at small extra cost.

**ALL-WEATHER TOP & BACK PANEL**—optional at small extra cost.

For winter tractor work—keep warm with the genuine **COMFORT** Cover—the tractor heater that more farmers use than any other. **COMFORT** gives you features you want—smooth streamlined fit, converts to low cost heated cab. Ask your dealer or write manufacturer.

**Here's What COMFORT Owners Say:**

**Earl W. Snider**  
Parkville, Missouri

"If I lose my **COMFORT** Cover, I'd get another one...and I mean right now! When it was 22° outside I worked in my shirt sleeves. So far I figure I've been able to work 14 extra days that would have been too cold without my **COMFORT** Cover. It's no trouble to put on my M-H '44' and I'm getting one for my '50' soon."

## Readers Enthusiastic About Forum Issue

This issue is of great interest to me on account of the evidence of your wonderful work for the cause of righteousness and our basic freedoms. I am sure you will receive strength and inspiration from on High and will continue your great service.—Warren R. Austin, U. S. Representative to the United Nations.

The December 2 issue is the finest and most important issue I have ever seen! What pleases me much is to see a tone of Christian faith running through it all. There is where the future of our country lies. Without it we fail; with it we cannot fail.—Ernest Bond, Thetford, Vt.

The Forum Issue is splendid. I thought that "Women Readers Offer Constructive Criticism" was really constructive and so was the advice of women in the "Big Task for Home and Church."—Mrs. Paul Townsend, Trumansburg, N. Y.

You have done a remarkable job in getting this issue together in the interests of freedom.—O. B. Price, General Agricultural and Livestock Agent, New York Central System.

I want to extend my congratulations to you, especially on your Forum issue which was dedicated to the preservation of our free enterprise system. You have done a magnificent job and I hope you will continue along the same line.—J. Herbert Walker, Commonwealth of Pennsylvania Department of Commerce.

I am an old duffer whose days are near an end. I am 90 years old, my seeing is poor, and my fingers don't find the keys as they used to do, but I can't keep from sending you my congratulations on your December 2 issue. It is simply great!—D. J. Redmond, Avoca, N. Y.

I spent yesterday afternoon in reading about every word in your December 2nd issue. I heartily agree with everything appearing therein, and wish every family in this country could have the advantage of reading it. Many people in our neighborhood will have an opportunity to read this issue as I shall see to it that our copy circulates among them.—E. H. Comstock, Monticello, Minn.

I want to congratulate you most heartily and sincerely on the subject matter of the articles in this issue of the Forum, particularly one relating to "Freedom on the March." Also, I was much impressed by the article "Honesty" by Rev. Walter Dodds.

You and your associates ought to be proud of this Forum issue.—Norman J. Gould, President Goulds Pumps, Seneca Falls, N. Y.

AMERICAN AGRICULTURIST has performed a great public service in getting out an issue of this kind. Constant repetition of this theme is our only hope in reversing the socialist trend in our country today.—R. M. Baker, Baker Lumber and Supply Co., Dryden, N. Y.

I do hope that everyone will read each and all of the challenging editorials and articles in the Forum Issue. A tremendous amount of effort, time and expense must have gone into this issue.—Edith Shaw Butler, Bernardston, Mass.

More power to you in your campaign to preserve the American system!—Everett Greaton, Maine Development Commission, Augusta, Me.

## FLORIDA CITRUS PULP HAS MORE TDN AT LOWER COST

Here's good news for dairy feeders! Market reports consistently show that Florida Citrus Pulp is outstanding in high TDN at extremely low cost. This concentrated carbohydrate feed contains factors which stimulate milk production—this means greater profits for you!

Ask your dealer about the many advantages of feeding Florida Citrus Pulp, or write a card today to Citrus Processors Association, P. O. Box 188-A, Lakeland, Florida.

## HOW TO REDUCE CROP FAILURES!

Here are two ways to help eliminate the risks in farming: One is to select high quality seed right from the start; the other is to follow proved profitable farming procedures. To get you off to a more profitable season this year, we have prepared a special booklet that includes up-to-the-minute facts about Ladino, Buffalo and Ranger Alfalfas, Cumberland and Kenland Clovers, Clinton "11" Oats, Birdsfoot Trefoil and other new farm seeds that are growing in popularity. In addition, this booklet gives valuable tips on fertilizing, stock feeding, weeds, grass silage, pasture and hay formulas, etc. This year, reduce the chances of crop failures on your farm! Send for the new booklet that tells you how. It's FREE.

## SAWMILLS AND EQUIPMENT

Are designed to cut and trim the most accurate lumber and do it most rapidly, because they are precision machines. Timken and Hyatt roller bearings, adjustable carriage trucks without end play, setworks accurate to 1/32", cut steel adjustable rack bars and similar features make Frick Sawmills the choice of sawyers and owners alike. Square-edged lumber means bigger profits. For this operation we suggest the Frick all-steel edger, built in two sizes, 27 and 32 inch, with 2 or 3 saws. Frick all-steel trimmers are built with 2 saws, are 20 ft. long and are of welded construction. Minneapolis-Moline Power Units are ideal drives for this equipment.

Visit your Frick Dealer today or your Frick Branch at Canandaigua and Amsterdam, N. Y.; Latrobe, Harrisburg, Montoursville and Easton, Penna. among other principal cities.

"LOOK FOR THE BULLDOG ON THE BAG"

## Controlling Rats And Mice On A Poultry Farm

Two years ago the college poultry farm (Massachusetts) was well stocked with both mice and rats. At the present time we have just a few mice and no rats at all. It has been interesting to observe the cleaning up of rats, particularly in old houses.

The heaviest rat population 2 years ago was in a two story 30'x30' house. Insulation board nailed on the studs was riddled with holes and a false ceiling provided an excellent breeding area for the rats. In the spring of 1948, 6 young kittens were placed in this house and allowed to grow up on a restricted diet. Late in the summer the young cats began to catch rats and the remaining rats began to find it difficult to eat when they pleased. Finally one day in the fall all remaining rats migrated. A similar procedure was found equally efficient in other houses so that today we are completely free of rats.

Mice are kept well under control but apparently keep returning. This means that a minimum population of cats must be kept on hand at all times. A ratio of 1 cat to 200 layers is maintained at the present time.

Adult birds soon become accustomed to the presence of cats and it should be made possible for cats to wander freely from pen to pen. Cats must be kept out of brooder houses as they might kill baby chicks.

—F. P. Jeffrey

## WORLD'S POULTRY CONGRESS

The 9th World's Poultry Congress is scheduled to be held in Paris, France, August 2 to 9, 1951. The idea of a World's Poultry Congress was born in 1912, but because of the war the first Congress was not held until 1921. In 1939 the Congress was held in Cleveland, Ohio, and attracted more than three-quarters of a million people.

—A.A.—

## HANDY FEED ELEVATOR

This handy homemade grain elevator loaded with five bags of grain is shown on the second floor of a grain room. The grain was loaded onto the elevator from the grain truck on the ground floor. Then, with an electric motor furnishing the power, it was drawn up to the second floor grain room for storage and emptying into the bins.

The elevator is made of 2x4's spiked together and covered with strong boards. Four iron rods, two on each side of platform, connect the platform to the top support. The ends of the rods are threaded and bolted. A chain attaches the elevator to the pulley.

Teat injuries lead to udder injuries, resulting in lost quarters; lost production. To promote good udder health, provide prompt antiseptic protection for all teat injuries. To promote normal milk flow through the canal of injured teats, use Dr. Naylor's Medicated Teat Dilators.

# Tests Boost Roughage

(Continued from Page 8)

into three equal groups, balanced as nearly as possible as to potential production, stage of lactation, age, body weight, and breed. Holsteins, Jersey, Brown Swiss and Ayrshires were used.

Every bit of feed was weighed when put into their individual mangers, and the uneaten portion weighed back.

The three groups were all fed high quality alfalfa hay and corn silage during the barn feeding periods and their summer grazing was on high fertility level grass legume pasture. Group 1 cows got roughage and no grain. Group 2 got roughage plus grain at the rate of 1 pound for each 6 pounds of 4% milk produced. Group 3 got roughage plus grain at a 1 to 3 ratio. All cows were fed hay 4 times a day.

## Actual Milk Production

Average actual production of 4% milk obtained by the cows in the three groups was: all roughage—8,410.0 pounds; light grain—9,741.4 pounds; heavy grain—10,313.0 pounds. Records are all on 2x, 305 day 4% mature equivalent basis.

The amount of increased production due to grain feeding, when compared with the amount of grain fed, produces the most significant facts obtained from the five-year test. Group 2, the

## FOUR-A WINNER

Robert Erdman

Robert Erdman, Little Valley, N. Y., who was a recent winner of the American Agriculturist Achievement Award as a member of the Dairymen's League Young Co-operators.

You may remember that when the 4-A award was presented to the Young Cooperators at the annual meeting of the Dairymen's League, Robert was unable to be present because his parents were delegates and he had to stay home and milk the cows.

Each year American Agriculturist Achievement Awards are given to a number of young people for their outstanding work as members of any one of several youth organizations.

cows fed light grain, consumed an average of 1,864 pounds of grain and produced 1,331.1 more pounds of milk than those on all roughage. From those figures it is easy to determine that the milk produced per pound of grain fed was .71 pounds. The Group 3 cows, on the heavy grain feeding, consumed 3,677 pounds of grain to produce 1,902.7 more pounds of milk than those on all roughage. The additional milk produced per pound of grain fed was .51 pounds—just a hair over a half pound of milk per pound of feed.

Whether or not the greatest net profit to the dairyman is in feeding all roughage, roughage and light grain, or roughage and heavy grain depends largely on the prevailing prices of grain and milk, and on production costs of roughage, Professor Kitchen said.

To answer this question, the New Jersey men prepared graphs showing profit over feed cost when grain is \$40, \$55 and \$75 per ton and for milk prices ranging all the way from \$2 to \$7 a hundred. Roughage costs used were from the College's agricultural economics department's figures for New Jersey farm production costs in 1949; alfalfa hay, \$28 a ton; corn silage, \$8.90 per ton; and pasture, \$1.45 per 100 pounds of total digestible nutrients.

Because it is more in line with pres-

ent price levels, we have reproduced on page 8 the chart prepared to show profit or loss when grain is \$75 a ton.

## Studying the Results

In analyzing the results, Professor Kitchen said, "Our present grain cost and milk price relationship proves that the feeding of liberal quantities of high quality roughages and light grain feeding is more profitable than either heavy grain or all roughage feeding. It is possible for the average price received for milk to fall below \$3.90 a hundred in spring and for the price of grain to stay around \$75. In this situation it would be more profitable to discontinue grain feeding until the price came back up to more than \$3.90.

"The most important factor in the application of the results of this work is that liberal quantities of high quality roughages, must be supplied to the dairy cows throughout the year."

Some interesting sidelights developed during the five years of the program. Because individual records were kept on the cows, it was learned that the low producers in the various groups (those with previous lactation records indicating they would produce less than 9,500 pounds) responded best to straight roughage. Of those cows on the all-roughage diet, those with records indicating they would produce more than 9,500 pounds only produced 79.4% of that potential. Those whose previous records showed that they should produce less than 9,500 pounds, actually produced 93.6% of their estimated possible production.

"These results are outstanding when interpreted in terms of the dairy industry in a state," Kitchen said. "For example, New Jersey's 158,000 cows average 7,210 pounds of milk a year on an average grain ratio of about 1 to 3. Each cow, therefore, is fed a little over a ton of grain per year, exclusive of grain fed during the dry period. Results of our experiment indicate that these cows, if given liberal quantities of high quality roughage, could produce 7,210 pounds of milk a year without any grain. Even if the grain to milk ratio was raised from 1 to 3 to 1 to 6, it would eliminate the feeding of 79,000 tons of feed which, at \$75 a ton, is \$5,925,000."

Much of this saving would also be in terms of increased profit, according to the New Jersey men, because concentrates are usually purchased and represent an out-of-pocket cost.

## Grass Silage Might Help

Corn silage was used for the New Jersey experiment for the reason that the College farm at New Brunswick was not equipped properly to harvest early grass-legume for silage. However, practically every man connected with the work feels that production would be even better if liberal quantities of grass silage were substituted for the corn. Carl Bender said that grass silage was used to supplement short pasture during one dry summer, and that during that time production was higher than at any other time during the experiment.

Carl Bender, who is nothing if not blunt, answered my question about the ability to grow top roughage with, "If with today's management information and equipment, a man can't put up good roughage, he shouldn't call himself a dairyman." He also had a ready answer for my other obvious question—about feeding hay 4 times a day in order to get enough in the cows:

"Fed them at both milkings, just before the farmer goes in for his own lunch, and the last thing at night when every good dairyman goes to the barn for a last look-around before going to bed."

# STOP asking for trouble

## Ask for ANTI-RUST SINCLAIR GASOLINE

Rust particles—the result of small amounts of moisture in your gas tanks—can stall your tractor, truck and car by clogging your fuel pump screen or tiny carburetor jets. New Anti-Rust Sinclair Gasoline prevents the formation of rust in your fuel system, because it contains Sinclair's miracle rust inhibitor, RD-119. It thus protects against hard starting, stalling and repair expense caused by rust and corrosion.

No other gasoline ever did this before!

So why take costly chances when you can get anti-rust protection in your gasoline at no extra cost to you! Phone your Sinclair Representative today!

**WORLD'S CHAMPIONS**  
OF CROSSBRED DIVISION  
IN STANDARD EGG LAYING TESTS  
1949-1950!

**Hall Brothers**  
**SEX-LINKED**  
**HALLCROSS PULLETS**

The Sex-Linked Hallcross Pen at Maine Egg Laying Contests 1949-1950 set a new world's record for the crossbred division. They laid 3438 eggs, scored 3682 points and averaged 264.4 eggs per bird.

Pick a real winner... a winner in performance and a winner on the record! That's the best formula for MAXIMUM PROFITS! And that's why Hall Brothers' Sex-Linked Hallcross Pullets are today considered the leading birds for commercial egg production!

Look at it this way! Here's a bird that has bettered the National Contest Average for 1948-1949 by 52.8 eggs per bird. And it has topped its own outstanding record of five years ago by nearly 18 eggs per bird! So, the record proves they're way out front and getting more profitable every year!

Non-trapnosed, non-pedigreed Sex-Linked Hallcross Pullets made these records so Hall Brothers customers can honestly expect and get substantial extra profits. What's more Sex-Linked Hallcross Pullets are carefully bred for those PLUS Crossbred characteristics of extra hardiness and vigor.

# An Egg Assembly Line

By L. E. Weaver

THE IDEA of an assembly line is not so modern as automobile makers may think. Old Mother Nature has been using them for thousands of years. Every egg that your hens lay comes down an assembly line that is a marvel of efficiency, particularly in the use of space.

Unlike most assembly lines, the hen's is 100 per cent noiseless. The yolk is put together at the head of the line in an organ called the ovary. When it is completed, it may or may not immediately start down the line which is the oviduct. Not until the signal comes from the other end of the line that the way is clear (that the egg ahead has rolled off the line and into the nest) can the new yolk be released. Just why there can be only one egg under construction at a time is still one of Nature's secrets.

Within minutes of the laying of one egg, the upper end of the oviduct (not unlike the head of a serpent with wide-spread mouth) extends itself around the next yolk and proceeds to "swallow" it. The sac in which the yolk was made has a zipper-like line across the bottom, and the yolk is released at the proper time by the splitting of the sac along this "suture line." Next time you dress a laying hen for Sunday dinner look for these whitish lines across each developing yolk in the yolk cluster which is the ovary.

## Hard Shells

Passing down the line smoothly and noiselessly the yolk slowly revolves while one layer after another of albumen (better known as egg white) is put around it—three layers in all. Two thin and flexible membranes next are put on and these give the egg its shape. Finally, nearing the end of the line the hard shell material is applied. Then the egg is laid. It is about that hard shell that this article is chiefly concerned.

Some shells are tougher than others, as every poultryman knows. Some shells are so weak that they crush in your fingers as you are collecting them from the nest. You don't find many such. Some seem all right when gathered but go to pieces in the egg room under ordinary cleaning, grading, and packing. Such losses occur almost daily on all poultry farms.

The big loss at the farm, though, is in cracked eggs that are still usable but can't be shipped and, if sold, can bring only a greatly reduced price. But the losses don't stop there. Many eggs are cracked in shipment and still others in the process of candling, regrading, cartoning, and hauling from place to place that are a part of the city market place. Of course, some breakage is due to accident, and much to carelessness, but the fact remains that under the same ordinary treatment most eggs come through with shells undamaged, while a discouragingly large number can't take it. Why?

## Feed "O.K."

That is the question that market men and poultrymen alike are asking. If most of the eggs can take it, why not all? Something must be wrong with the shells on those eggs. What is it? As usual, the first thing to get blamed was the feed. The hens are not getting enough oyster shell or something. But the feed experts are right up to the minute on that point. Sure, they say,

we know that in order to make good shells, hens must have plenty of lime from materials like oyster shell or limestone, and they also need vitamin D and manganese, but we have been putting all that in the feed for years. So we had to look farther than in the feed bags.

Someone noticed that every summer as hens were nearing the end of their year of laying, the number of weak shells grew larger and larger. When this was mentioned, it appeared that practically everybody had noticed it. So again they thought of the feed. But more oyster shell boxes and more cod liver oil didn't seem to help a bit. It was even suggested that the hens were just getting tired out, or their shell-building machinery was. It's strange that

## AN EGG ASSEMBLY LINE

(Continued from Opposite Page)

nobody thought of blaming the weather, yet that is what turned out to be the cause of the trouble—just plain hot weather.

In order for lime to get from the hen's digestive tract over to the oviduct where it is used to make the egg shell, it must be dissolved and carried in the blood stream to the new location, then turned back into solid lime. Well, you have heard of people who have lived in warm places like Hawaii or Florida until their "blood gets thin," and they can't stand cold weather. Something of that sort happens to laying hens in hot weather. Their blood, when tests have been made, doesn't contain as much lime in solution as it does in cool weather. So thinner shells in hot weather probably come from less lime to make them with.

You can't do much to correct a situation like that, except perhaps if you have more money than common sense you might install air conditioning for the hens. All of this, however, still doesn't answer our question. Even in hot weather some hens' eggs are not so fragile as others. They are merely a little less strong than before, but still tough enough for careful handling.

### Inheritance

The real solution seems quite obvious. Let's try using these hens that lay eggs with tough shells as mothers of the next generation, hoping that they can and will pass along this money-saving trait to their daughters, their daughters' daughters, and their sons' daughters. That has been tried, and it works.

So it is now mostly up to the men who produce baby chicks to do the job of cutting down losses from weak shells. Two things they can do that will help. First, not set eggs from flocks in which cracked shells are common. This should give results that will show up right away in next year's layers. The other action is a long-time job, but in the long run much more certain and permanent. It is to test each group of full sisters in pedigree pens for shell strength and use only families (sons as well as daughters) in breeding pens that pass the test with a high rating.

### Laying Tests Can Help

Last year one of the New Jersey laying tests ran egg quality tests on the different strains of hens in the tests. The great variations from excellent to poor were startling. Some otherwise excellent strains were found sadly lacking, and their owners now have a real job of improvement of quality ahead of them. This coming year many laying tests will be making tests of shell strength, and also of albumen quality of the many strains entered in the tests. We will then have some idea at least of which breeders already have high quality and which ones still have a long way to go.

—A.A.—

### VACCINE HOLDER

This handy home-made vaccine holder prevents the vaccine bottles and their contents from being spilled by a struggling bird. This holder consists of a small piece of scrap board with holes drilled in it to hold bottles securely. A base board is nailed to bottom of a wooden box when in use. Holder may be removed after use and stored for the following season.—C.L.S.

# BABCOCK'S HEALTHY CHICKS

## Make Great Layers

At the 1950 Storrs Connecticut Egg Laying Test, our White Leghorns won first, all breeds. For the fourth time we won high leghorn pen at the Georgia Test. In 1949 we set an all-time high record, winning Poultry Tribune Trophy. In 1950 we were second. High spots in our past records are as follows:

These Babcock Leghorns set a new World Record for all breeds by laying 4,057 eggs for 4,336.25 points at The Western New York Egg Laying Test in 1944-45.

Winners of the Ninth Official California Egg Laying Test held in 1949. These Babcock White Leghorns showed a net income of \$8.10 per hen, laying 294.7 eggs per bird and with 100% livability—the highest net income of any California Test year.

Highest White Leghorn pen in the Nation for all United States Tests, 1946-47. Won at Western New York Egg Laying Test.

High White Leghorn pen, all United States Egg Laying Tests for 1941-42. The record: 3,839 eggs and 3,940.4 points in 51 weeks was made at the Pennsylvania Official Egg Laying Test.

Vancross—Harris' New F2 Hybrid Tomato

## HARRIS SEEDS

Hybrid Vigor - Earlier Fruits - Larger Yields

That's what you'll get with Harris' new second generation (F2) cross —Vancross. Starts bearing a little ahead of Valiant and continues to hold up well all season. The attractive globe-shaped fruits are uniform, smooth and well colored at the shoulders. Flavor is delicious; the flesh meaty. Costs much less than first generation hybrid seed.

Give Vancross a trial this year. We know you are going to like it.

You know that good silage provides the most profitable, efficient feeding. And you'll find that a durable Craine silo is not an expense. It's an investment—and like other farmers, you'll say "My Craine is the best investment I ever made!"

CRAINE'S THE NAME

The early buyer gets seasonal discounts—better service. We'll send full details, including easy payment plans. No obligation—just drop us a line.

Craine, Inc., 111 Pine St., Norwich, N. Y.

# CRAINE SILOS

By J. F. "Doc" ROBERTS

**R**AISING livestock in a war economy is not new to most of us now in the production, feeding, marketing, or even meat end of the business. The experiences of two major wars can be useful, although there is no guarantee that they will repeat themselves.

I think it is fair to assume that again there will not be enough meat to go around and that by-products, such as wool, leather, fats, etc., will also be short of Army requirements and civilian demand. The intensity of these shortages will depend, of course, on how deep we get into this trouble. Present estimates of Army personnel and increased government jobs already assure shortages. These shortages will create misunderstandings and accusations, aside from the real problems they create.

As livestock costs of production and feeding spiral, and as the finished product also goes up, the farmer will be accused of profiteering. If animals are fed to a maximum weight to produce more meat, the farmer will be accused of holding back needed products, and so on and on. We must anticipate and expect this sort of thing, but no farmer can be thin-skinned. This is really unimportant in a crisis.

### Unnecessary Regulations

Next, we can expect laws, regulations, directives and what have you from politicians. We should fight these more than we ever have. They do slow down production as well as incentive for greater production. They create nothing in pounds of meat and do create incriminations, discontent, disloyalties and every other bad feature of black markets. Most of them are dishonest in their conception. If the government is buying 20% or 60%, why isn't the public told that they must get along on what is left, instead of being told, "Everything will be all right, for we have passed a law to get you what you want at the price you want to pay, so vote for us."

Our job, as in the other wars, is production and more production. Farmers did the job before, and they will

again. From a strictly livestock angle, other wars have proved that prices will go up, that taxes and costs will also go up, that the trials and tribulations of production will increase, and that politicians and the general public will increase farm burdens rather than help.

Legitimate livestock expansion is called for, and it is only legitimate in the Northeast as your available rough feed increases. Your housing, winter protection and grains can be handled in many ways. In the last two wars, livestock farm failures were practically all traceable to hay, pasture and other rough feed shortages on those farms.

A wholesome attitude and peace of mind will be difficult to maintain, but even the horrors of war must be lived with. Nevertheless, the fundamental principles of good farming and good livestock husbandry will not change.

— A. A. —

### A CHANCE TO HELP

The Rev. W. A. Dodds, Pastor of the First Presbyterian Church of Ithaca, N. Y. came back from a recent trip to the Near East more firmly convinced than ever that the way to help people is to help them to help themselves. Mr. Dodds says that four out of five of the best workers in rural church areas, in both foreign and national mission work, are those who in addition to their fine theological training have had a good course in some agricultural college. Missionaries with this kind of training are then well qualified to teach people in foreign lands ways to improve their backward and obsolete farm practices, thereby raising their standards of living.

The New York State College of Agriculture has been a leader in training missionaries for foreign work, but unfortunately missionaries no longer have hope of getting furlough agricultural training at Cornell because of the impossibility of renting adequate quarters in Ithaca at prices they can afford. In an effort to meet this situation, Mr. Dodds now has an offer of cash to build a five-family apartment house at Ithaca for the use of these missionaries, providing he can get the lot on which to build it. Such a lot will cost \$2,000.00. Mr. Dodds himself has put up \$500.00 of his own money toward the lot because he feels so strongly that rural rehabilitation can be accomplished here and abroad only by men trained both in agriculture and theology.

We of AMERICAN AGRICULTURIST fully agree with Mr. Dodds and are passing this information on to you with the thought that there may be among our readers some who would like to contribute some part of the remaining \$1500.00 needed to carry out the project. If so, any such contributions may be sent to the Board of Trustees, First Presbyterian Church, Ithaca, N. Y. The building will be equally available to missionaries of all denominations.

## Effective Cough Syrup, Mixed at Home for Economy

No Cooking. No Work. Real Saving. Here's an old home mixture your mother probably used, and is still one of the most effective for coughs due to colds. Once tried, you'll swear by it.

Make a syrup with 2 cups granulated sugar and one cup water. No cooking needed. Or you can use corn syrup or liquid honey, instead of sugar syrup.

Now put 2½ ounces of Pinex into a pint bottle, and fill up with your syrup. This makes a full pint of cough medicine, and gives you about four times as much for your money. It keeps perfectly and tastes fine.

And you'll say it's really excellent for quick action. You can feel it take hold swiftly. It loosens phlegm, soothes irritated membranes, helps clear the air passages. Thus it makes breathing easy and lets you get restful sleep.

Pinex is a special compound of proven ingredients, in concentrated form, well-known for its quick action on throat and bronchial irritations. Money refunded if not pleased in every way.

**FOR EXTRA CONVENIENCE GET NEW READY-MIXED, READY-TO-USE PINEX!**

## GLORIOUS Roses

Gypsy—Harris' New Hybrid Bedding Petunia

## HARRIS SEEDS

"Gorgeous!" — "Exciting!" — "Exotic!"

... are only a few of the exclamations when visitors to our Trial Grounds saw Gypsy for the first time last summer. It's Harris' new Hybrid Bedding Petunia with buds of scarlet that unfold to large blooms of a burnished scarlet-salmon. Hybrid vigor is apparent in the husky, dwarf, compact plants and the large flowers of good substance. A border of Gypsy in your garden will be a joy all summer.

## CALIFORNIA TOUR STARTS FEB. 17

Here is a glimpse of typical High Sierra scenery of northern California, one of the many spectacularly beautiful places to be visited by our American Agriculturist California Tour party (February 17 to March 13), escorted by Verne BeDell. We'll see gorgeous California, quaint Tijuana in old Mexico, the amazing Carlsbad Caverns, glamorous New Orleans, and many other wonderful places. It will be a fascinating trip, with happy companionship, maximum travel comfort and no worries—all at a reasonable cost. You can get a copy of the itinerary describing all the sights we will see by writing to E. R. Eastman, Editor, American Agriculturist, Box 367-T, Ithaca, N.Y.

# Our Rural Play School

By AGNES A. WARD

**T**HE mothers of pre-school children in Franklin, New York, have demonstrated that a country village of about 600 population is as wide awake and receptive to new trends of thinking as a modern city.

About four years ago a few of these mothers became intensely interested in reports of the excellent work that nursery schools in other communities were doing in helping little tots to learn to live and play happily together, under the supervision of an understanding teacher. With the help of the minister's wife, Mrs. Robert Howland (now of Essex, but at that time in Franklin's Congregational-Baptist Church), the mothers went to work, in spite of the opposition of some die-hards in the village, and made plans for the Franklin Play School.

The Inter-Church Council was made the sponsor. For the teacher, the mothers unanimously chose Mrs. Roland Steffen, a dark-haired, brown-eyed, rosy-cheeked little lady, a grandmother but not looking in the least like one. Mrs. Steffen loves and understands little folks and, besides being a busy farm wife, has been a successful nursery school teacher in the Sunday School for many years. She has also helped annually in the Daily Vacation Bible School, working with kindergarten teachers—all of which has given her valuable experience.

At first the school—which averages about 10 children each year—met in town; but when the public room used for it became unavailable, Mrs. Steffen held the school in a room in her own home. Here were transported the table, benches, chairs and other equipment made by the children's fathers under the guidance of a village carpenter. With his help they drew up the plans for the furniture and equipment and made them in the Franklin Central School workshop.

Each year, Mrs. Steffen and the mothers and fathers have added to the equipment. There's a wonderful horse that can catch the strangest diseases and be doctored by embryonic vets. There are housekeeping toys—a toy tea table, dishes, chairs, dolls; a toy kitchen with the essentials; doll carriages and beds. The boys have a toy barn, stocked with docile cattle, and they have trains, trucks, and planes. There's a large assortment of children's string beads, sew cards, make gifts for their parents on special days, play pound-a-peg and put simple jig-saw puzzles together.

In pleasant weather, all play is outside, where there are swings, teeter boards, a slide, sand box, carts, hammer and nails, and the delightful opportunity of going to the barn to make friends with the animals.

The school meets three times a week—Tuesday, Wednesday, and Thursday—from 9:30 to 11:30. It is for all pre-school children who are at least three

years old, and a nominal fee of \$1.50 a week per pupil is charged, payable to the teacher.

The daily program includes a "free play" period; a rest period, during which each tot lies on his own blanket; a story read to the children by Mrs. Steffen; handwork; and a lunch served at a low table painted pink (the dad's handiwork). A child's grace is said before they eat.

The children have records, too, and

sometimes they play in a rhythm band. Banging pie tins together and clanging cymbals of covers, they can go to town in a Memorial Day parade just as well as their older brothers and sisters.

A group of three mothers forms the Play School Council. They meet before each of the three terms and talk over plans with Mrs. Steffen. They assist with the financial end and collect any delinquent bills. The Council usually retains one experienced member for the next year, but changes the other two. The parents furnish transportation and take turns driving the children to the Steffen farm. A "Transportation Chairman" is appointed by the Council, so that a schedule can be planned and

adhered to. If a child has any symptom of cold or has been exposed to a contagious disease likely to take, the mother keeps the child at home in order not to expose the others.

The extra bother and expense are completely offset when the parents see the beginning lessons in democracy and right social living taking a firm hold in their child. The self-centered only child is taught to share and the dominated child in a large family taught to express himself on an equal footing with others of his age in a happy atmosphere.

To her already full schedule, Mrs. Steffen adds parties and picnics for the

## GINGERBREAD and - - -

by  
**MABEL  
HEBEL**

Gingerbread served  
hot with Orange  
Sauce becomes a de-  
licious pudding.

**W**HEN I was a little girl, gingerbread was always a popular dessert at our house, especially if accompanied by apple sauce or whipped cream. But I remember one occasion when my mother frosted the gingerbread. When it came to the table, it looked like frosted chocolate cake.

There were five of us children, and as usual, we raced through the meal to get the dessert. My brother Frank, who was nothing if not alert, suspected my mother the moment he looked at the "cake," and voiced his suspicions. The rest of us poohed-poohed the idea.

"No one would be silly enough to frost gingerbread," we said. But when we took a bite, we discovered that Frank's worst suspicions were true. Our mother had departed from the beaten track, and our disappointment was great.

Probably my mother had just wanted to do something different, but of course she had gone too far—in our opinion. I was reminded of this crisis

the other day when I ran across a new recipe for Bran Gingerbread, but it intrigued me, so I tried it. The results were so good that I'm sure you'll want to try it, too. From the same recipe you can make a hot cottage pudding or a spicy pineapple upside down cake—two gingerbread variations that your family will enjoy, unless I miss my guess!

### BRAN GINGERBREAD

- 1/2 cup shortening
- 1/2 cup sugar
- 2 eggs
- 3/4 cup molasses
- 3/4 cup boiling water
- 3/4 cup ready-to-eat bran
- 2 cups sifted flour
- 1/2 teaspoon salt
- 1 teaspoon baking powder
- 1 teaspoon soda
- 1 teaspoon ginger
- 2 teaspoons cinnamon

Blend shortening and sugar; add eggs and beat until creamy. Add molasses and mix well. Pour boiling water over bran and add to first mixture. Add flour sifted with remaining ingredients and stir until batter is smooth. Bake in greased pan, with waxed paper in

the bottom, in moderate oven (350° F.) about 45 minutes. Yield: 12 servings (9 x 9 inch pan).

For a pudding dessert serve the gingerbread hot with this tangy orange sauce:

### ORANGE SAUCE

- 2 tablespoons cornstarch
- 1/4 cup brown sugar
- 1 cup orange juice
- 1/2 teaspoon orange rind

Mix together cornstarch and corn syrup. Stir in orange juice. Cook over low heat until mixture thickens, stirring frequently. Continue cooking until sauce is clear, about 5 minutes. Stir in orange rind. Serve hot.

### PINEAPPLE UPSIDE DOWN GINGERCake

- 2 tablespoons butter
- 1/2 cup brown sugar
- 4 slices canned pineapple, OR
- 1 cup crushed pineapple, drained

Melt butter in 9-inch pan; add brown sugar and distribute evenly over bottom of pan. Arrange fruit on top of sugar mixture. Spread gingerbread batter on top of fruit. Bake in moderate oven (350° F.) about 45 minutes. Yield: 6-8 servings.

### WHAT'S GONE BEFORE

Deciding that he must answer Abe Lincoln's call for volunteers, Mark Wilson talked the matter over with his sweetheart, Ann Clinton, and they are married at an evening service in the church before a large congregation. Next morning Mark and Ann leave for the County seat, where Mark enlists and leaves Ann to return home to wage the battle of loneliness and worry.

The weeks pass and Ann learns from her father that the bank has sold the mortgage on their farm to Henry Bain, a neighboring farmer who had tried to get Ann away from Mark. Meanwhile, Charles Wilson, one of Mark's younger brothers, is rebelling against the monotony of farm work. Finally he leaves in the night, walks to the County seat and enlists. His father follows and brings him back to say goodbye to his mother.

### CHAPTER IX

IN the days that followed Charlie's departure to join his company, George Wilson was more demonstrative than usual toward his wife and children. Occasionally, to Nancy's surprise and pleasure, he let his hand touch her shoulder as he passed her. But as he went about the everyday work, made doubly hard now by the absence of the older boys, he was unusually quiet even for him.

No matter how hard he worked, or how long the days, he never missed an evening at the Post Office to get the news and maybe a letter. Frequently he met Ann there and they came back together. Had Nancy been inclined to be sensitive, she might have felt a little jealous of Ann, for it was only when she came to have a meal or to spend an evening with them that George came out of his abstraction and silence and talked freely about the war and the boys.

What Nancy didn't know was that he was plagued by the thought that perhaps he was just as able to go and maybe it was just as necessary for him to carry a gun as it was for his boys, particularly young Charlie. Once she got an inkling of how he felt when he said, suddenly:

"The boys have gone. Maybe I ought to go and help take care of them."

"Nonsense!" she snapped. "How could you look out for them? You would probably not be assigned to the same regiment, to say nothing of the same company."

He let the matter rest there for the present, but his remark planted another worry in her mind, and she thought about it constantly, except when she was too tired to think at all. Both she and George were up at dawn each day and fell into bed at night almost too exhausted to get their clothes off. With the help of Tom and some day labor from Enoch Payne, George managed to get the last crops in and the cultivating done during June. But the worst job was the milking. Tom was too young to help much with the milking, and that left a long line of cows for George to milk every night and morning. Most of the cows had freshened in the spring, and now with the lush June pastures they were in full production. His hands and arms ached all the time from the strain of milking them. Sometimes Nancy, leaving the little girls to do the best they could with breakfast and supper, came

to the barn and milked two or three of the cows. But she had so much to do in the house that she couldn't do this regularly.

After the milking was finished, George carried the milk, two pails at a time, to the big cool farmhouse cellar where Nancy poured it into the pans on the long lines of shelves. When the cream was raised she would skim it by hand from the pans, dumping the skim milk into pails and carrying it to the barn to feed the hungry calves and the four pigs. Three or four times a week the cream had to be churned into butter. The girls helped some with this, but they soon tired, and most of the work fell upon their mother.

When the butter was churned, Nancy put it into the big butter bowl and worked it back and forth with the butter ladle to free it from the buttermilk, and then she packed it in crocks ready to sell. Once a week Nancy put these crocks of butter into the back of the big democrat wagon and drove to the village, where she traded most of her butter to John Crawford for groceries. The remainder she peddled out among her regular customers in the village.

The hens, too, were Nancy's responsibility. To keep her flock replenished she would put thirteen eggs under each of several "setting" hens, and at the end of twenty-one days the mother hen and the fluffy little chicks she had hatched would be put into a small inverted A-shaped coop. There they had to be fed and watered and guarded from rats and other vermin until the chickens could more or less take care of themselves. Eggs from the flock, ex-

cept those eaten by the family, also went to John Crawford for a few cents a dozen or were traded for groceries.

There was a garden, too, which supplied the family with vegetables for the table during the summer and enough for Nancy to can for their use through the winter. Both parents believed in developing habits of responsibility in their children, so they were taught to work as soon as they were able, and it wasn't enough to work until they were tired; the principle was to stop when the job was done. Even the little girls could weed the garden and help in feeding the calves, getting meals, and washing and drying dishes.

Occasionally, as Nancy went about her countless tasks, she would straighten her back and look off across the fields, soft and blooming under the June sunlight, and think that even with the hard work it was a good life, a wholesome life, or at least it had been until war came. War changed everything, made everything worse. And always in her mind were thoughts of Mark and Charlie. Where were they? What were they doing? Were they in danger? She liked to talk with Ann about them. It helped to be able to share her love and her worries with Ann.

Mark wrote frequently, often to his wife and occasionally to his mother. The letters were cheerful, but it was apparent that, as yet, he had not found the adventure that had been part of the reason for his volunteering. He was impatient with the waiting, and waiting seemed to be all the army was doing, except for the constant drilling. He wrote that all the boys were utterly tired of it.

June, usually the nicest month of the year on the farm, slowly dragged by. The crops were all good. The corn on the flats was now knee-high and seemed to grow inches every warm night. It no longer needed any attention until harvest time. The potatoes were growing well, too. They needed hoeing, but probably wouldn't get it. In former years George had taken great pride in his good crops. This year, with work crowding him and his thoughts on the war more than the farm, the growing crops and the work they required annoyed and worried him. Especially

was this the case with the haying which was now upon him. The meadows stretched away across the farm with a heavy growth of grass; and without the boys' help, and with all the chores to do, George didn't see how in the world he could get his haying done. He could get Enoch Payne to help some with pitching the hay on the wagon and unloading it in the barn, but Enoch was in demand by several neighbors and could only spare a day or so a week to help George.

Resolutely George tackled the job himself. Rising at 3:30 in the morning now, earlier than ever before, he did his chores, sharpened his scythe to a razor edge, and started the formidable job of scything.

When George was mowing in the meadows near the house, Nancy could occasionally hear the familiar clang, clang, clang when he stopped to whet his scythe. It was a long time between breakfast and dinner time, so in the middle of the morning Nancy would send one of the little girls out to George with a snack and a jug of cool milk from the cellar. Once in a while, when time permitted, she would take it herself and sit with her husband in the shade while he ate. Not much talk passed between them at these times, for their understanding was such that no talk was needed.

The sun cured the grass rapidly, and Nancy, Tom and the girls came into the fields with their hand rakes. Enoch got in the habit of coming over late in the evening on good haying days, and he and George would spend the last few hours of daylight putting the hay which had been cut the day before into the barn.

But the haying days of July went so rapidly and the one main job so slowly that the month was two-thirds gone and the haying only half done. Now the grass had turned brown and tough, making the scything all the harder.

The group who met in John Crawford's store in the evenings to get the news and an occasional letter was even more impatient than the boys at the front about the apparent hanging back of the Union forces. "Why don't they march on to Richmond and get it over with and let the boys come home?" expressed the general feeling, especially among those who didn't have boys at the front. George Wilson listened to this talk, but said little, for one reason because he was always so tired and for another because, in common with other fathers, his heart and mind were torn with fear. "On to Richmond" meant battles, and battles meant death to some, and how could he know that it might not be his own sons. It was easy enough for those to talk who had no sons to think about.

There was rejoicing when the news came through that General George B. McClellan had driven the Confederates out of West Virginia, and that that state would now be loyal to the Union. But then the impatience increased. Why didn't Lincoln and General Scott, McClellan and the other commanders move "On to Richmond" and bring the war to a speedy conclusion? That's what everybody expected them to do, and why were they hanging back? When these thoughts were voiced by a member of the group, Henry Bain said one night:

"Maybe Abe and old man Scott are just plain scared. Maybe you fellows ought to be thankful that the army isn't moving on to Richmond. There's just as good a chance that the Confederates could move on to Washington. That would end the war, too."

That seemed to be the signal for their breaking up that night. Many of them didn't like Bain, but they said nothing, knowing that he had put into words what many of them feared.

Then one night in the latter part of July, George Wilson, chores done and supper eaten, dragged himself down

## NO DRUMS

(Continued from Opposite Page)

again to the nightly rendezvous. There he found a larger than usual crowd of neighbors, all excited and all talking at once. The stage that night had brought the news that at last General Scott had responded to the demand, "On to Richmond." But he had been met by the Confederates at a place called Bull Run and defeated, "licked" was the word Bain used to describe the rout.

In the background John Crawford listened to the excited discussion for a few moments, then got up, sat on the edge of the counter and raised his hand for quiet. Pushing his spectacles forward on his nose and looking over the top of them from under his shaggy graying eyebrows at his friends and neighbors, he said:

"The news is that the North is scared and the government is even thinking of moving out of Washington. I've been listening to you talk here, and I suspect the same kind of talk is going on in a thousand other neighborhoods. But let me tell you something. The Rebs have won a battle, but not the war. All that this battle proves is what some of us thought all along—that this is not a three months' job. It may take years."

To emphasize his point, he raised his long arm, which stuck out of a too-short sleeve.

"Whether it takes months or years," he declared, "we're going to win this war! Of course the boys from the South are Americans, and all Americans can fight. Bain said a spell ago that they are more used to guns down there than are our boys. Maybe that's so. But," wagging his finger at them, "our boys can learn and will learn. And we've got some things the South hasn't—we've got more men and we've got more resources, and we've got the right of it. If we can hold the South from coming clear through to final victory for a while we'll wear them out, and that's what we've got to do and every man jack of us has got to do his part."

He turned to look directly at Henry Bain.

"As for you, Hank, and others like you, I'm tired of hearing your kind of talk. If you ain't man enough to go to war, at least you can keep your mouth shut. There's a lot at stake in this fight, and some of us ain't foolin'. And I tell you again that if there are others in this neighborhood that feel as you do, they'd better keep their ideas to themselves."

He slid down from the counter. "G'night, boys! I'm tired and so be you. All of us are going to need all the rest we can get."

After they had gone to bed that night, George said to Nancy:

"Nancy, I've something to tell you." Feeling sure that she knew what it was, Nancy remained silent, which made it more difficult for George to begin. At last he said:

"The Union forces were badly licked at a place called Bull Run on July 21. They've retreated back toward Washington almost in a rout. I'm sure that Lincoln will call for more volunteers. You'll probably think that my duty is here with you and the children, and maybe it is. But for some time I've felt, Nancy, that if we can possibly arrange so you can get along, I have a bigger duty to follow the boys into the army. The more of us that feel and act this way, the sooner it'll be over and we'll have our boys back."

That was a long speech for George and when he stopped a silence hung between them, broken finally by Nancy, whose carefully controlled voice sounded unnatural:

"If that's the way you feel, George, that's all right with me. I don't know how we'll get along, but there must be some way, and I'll manage. But George, you've got to remember that you are

no longer young. You'll ruin your health sleeping on the ground, and things like that."

"I've thought it all out," he said, eager to explain now that the first fence was down. "You and Tom and the girls can't take care of this dairy, of course, so I've decided to sell all the cows but one or two, leaving just enough for butter and milk for you and the family. The haying isn't all done, but I can finish the rest of it in the next few days. The other crops will be all right till fall, and perhaps the war will be over by then. If it isn't, maybe I can get a furlough for two or three weeks to get the corn cut and the potatoes dug. I sowed a couple of acres of buckwheat the other day. That'll give us enough buckwheat flour to get us through the winter, and I'm sure you can get Enoch to cradle the buckwheat and put it in the barn. Maybe he'll help some with the other work that you or the children can't do."

"Oh, Enoch'll go, too," she said, a little bitterly. "I wonder why men never realize that there's a home front as well as a battle front in war."

"Now, Nancy," he remonstrated, "that's a little unfair. I know what this means to you, but I've thought and thought, and, as I've told you, in order to keep our families we've first got to keep a country."

"Well," she agreed, "maybe you are right. I don't know! But I've told you we'll get along somehow, and we will."

With that he had to be content, but in spite of his weariness, sleep was long in coming.

The next day George started to reduce his farm operations to a minimum. His cows were good, but when he tried to find a market for them, there was little because so many other farmers were in the same position of reducing or getting rid of their herds, their boys or their hired help having gone to war. Reluctantly, at last George talked with Henry Bain, who dealt in cattle. As he expected, he found Henry unwilling to pay what the cattle were worth. With his mind made up to do business at any price, George was a poor bargainer, and finally he sold all except two of his cows and all his young stock to Bain for a ridiculously low price. "At least," he thought, "the few hundred dollars will keep Nancy and the children going for a long time with what cash she will need."

With sad heart and much misgiving as to the wisdom of his decision, a few days later George watched Bain drive his herd off the place and down the road, the herd which he had spent many years in building up.

(To be continued)

—A.A.—

## OUR RURAL PLAY

(Continued from Page 23)

children. Birthdays always mean a cake and candles. Christmas brings Santa Claus (Mr. Steffen \*in appropriate disguise).

We who have sent our children to the Franklin Play School and then seen them enter the larger kindergarten, ready without tears or tantrums to take their place in this new world, know the value of this play school experience. We know that the seeds of democracy, of learning to give and take and to live happily together, are already sown and will grow to greater advantage for our youngsters.

In my own family we have two "only children" —fourteen years apart. The younger one, Buffy, started kindergarten last September, and her easy entrance into school life with the background of the Play School has already shown her to have a far happier frame of mind than that of her sister.

(The Franklin Play School pupils in picture on page 23 are, clockwise from left foreground: Robert Bartlett, Elizabeth (Buffy) Ward, David Peake, Kay Davidson, David Morgan, Terry Matteson, David Clark, and Betsy Law.)

# Brings in Programs

Where Others Miss!

**Brand New Zenith  
"Super-Medallion"  
with Super-Sensitive  
Zenith FM and  
Long-Distance AM**

DAY OR NIGHT, summer or winter, Zenith's new Super-Sensitive FM brings you more stations, more programs, all beautifully clear and static-free. Super-Sensitive FM really "reaches" for distance . . . plays where AM radios and many FM sets are practically useless. Brings you sports, news, weather and market reports—a whole new world of entertainment on FM.

Also, its superior Zenith® tuning circuits prevent station drifting or fading. Its Zenith-built speaker gives you all of FM's superior tonal beauty at its best. And thanks to Zenith's built-in FM antenna you can plug in and play in primary signal areas.

All this, plus Zenith's famous Long-Distance® AM reception. New giant dial for easy tuning. Rich walnut plastic cabinet. AC, DC. Hear it now—at your Zenith radio and television dealer's.

## FM Set-Owners:

Don't miss the fine programs offered by FM stations of the Rural Radio Network, including the famous

## WQXR Concerts

of classical and semi-classical music plus hourly news reports prepared by the New York Times, now broadcast 7:30-11:06 p.m. Mondays thru Saturdays and 3:00-11:06 p.m. Sundays. The excellence of these programs deserves the superior clear-toned, static-free reception provided by super sensitive Zenith FM.

Zenith Radio Corporation, Chicago 39, Ill.

↑ The Seabrook Farms label is placed only upon frozen foods of really high quality—gathered, processed and quick-frozen when strictly fresh. The Seabrook Farms quick frozen vegetables are now available in a selected list of good food stores throughout the Northeast.

↑ Diesel crawlers plowing on the contour, each tractor turning five furrows. On seemingly flat, light vegetable loam, erosion is enough of a problem to warrant attention. Given about 300 acres of plowland each year, the diesel crawler will plow and harrow at about half the cost of gasoline wheel tractors. However, diesel wheel tractors capable of pulling three 16" bottoms are as economical, faster, and, because they can be used in all other work requiring wheel tractors, will gradually be increased in numbers.

Supplemental irrigation of fall grown spinach. Seabrook Farms now has overhead irrigation available to 2,000 acres, a development which started 38 years ago with the tall overhead pipes of the Skinner system. All installations of recent years are of the portable type. Irrigation pays handsomely on high value crops like spinach and broccoli. All Seabrook crops are rotated, and irrigation is of course used on the crops of lower acre value like peas and lima beans when their turn comes to occupy irrigated land.

↑ Meet the Seabrooks, father and sons, left to right: John M.—farmer and executive vice president; Charles F.—founder and head; Belford L.—engineer and technical specialist; C. Courtney—sales manager. It is a family operation.

## Kernels, Screenings and Chaff

### Seabrook Farms

By Tom Milliman

**F**OR MENTAL exercise, try adjusting your mind from ordinary sized farming to the largest vegetable growing enterprise in the country and back again all in two days. This has been happening to me at regular intervals for seven or eight years in attending board meetings of Seabrook Farms Company.

Imagine 19,000 acres—more than 75% under the plow—and picture the following amount of work involved:

Lima beans	6,000 acres
Peas	2,400 acres
Sweet corn	2,400 acres
Spinach, in 12 inch rows	2,500 acres
Beets, in 12 inch rows	500 acres

The remaining 6,000 acres grow snap beans, broccoli, rhubarb, kale, turnip greens, etc. About 25% of the land produces two crops a year. An example is peas followed by spinach.

To operate this land, 60 diesel crawlers and 250

wheel tractors are required. Farm manpower runs as high as 1,300 at the height of the season and drops to 300 or less in the winter. Plant labor is additional.

Including repeats, hired airplanes dust or spray 45,000 acres in a season, both for Seabrook Farms and for 749 neighboring farmers who grow on contract.

To keep the freezing plant supplied, contract growers produce 20,000 acres of vegetables for freezing at Seabrook Farms plant.

The term "corporation farming" is generally applied to Seabrook Farms Company. That term is correct only in the technical sense. Actually, it is family farming on a grand scale, built up from the 57 acres with which father C. F. Seabrook, still very much on the job, started many years ago. The operation is in the form of a corporation only for convenience of doing business in the modern manner. The enterprise is controlled by C. F. Seabrook and his sons, as well as run by them. Of course, they employ highly trained key men to assist them at vital points in the business. Location is near Bridgeton, N. J., about 50 miles south of Philadelphia.

Seabrook headquarters. The freezing plant and zero storage are to the right of the power house stack. Note that headquarters is in the country, surrounded by farming. Behind the stack is irrigated broccoli, and in right foreground, irrigated spinach. To the immediate left of stack is postwar company housing, beyond which is government housing established during World War II and now leased to Seabrook. The freezing plant is the largest in the world.

### SAYS MASTITIS CHECKED FAST WITH PENSTIX®

SCHENEVUS, N. Y.—Robert A. Stilwell, shown above, operates a 140 acre dairy farm in this prosperous farm area, milking an average of 30 cows the year 'round. He has been using Wyeth's PENSTIX to control mastitis since these effective bougies were first introduced. Here's what he says:

"For a quick, easy way to control mastitis fast, I find PENSTIX especially handy. They have always worked fine for me, they are easy to use, there's nothing to sterilize and I can keep a supply right in the barn."

Mr. Stilwell believes speed of treatment is important, and says, "I think one of the secrets in controlling mastitis, is to catch it fast at the first sign. I can certainly do this with Wyeth's PENSTIX."

### WYETH'S PROVEN PRODUCTS FOR MASTITIS CONTROL

- PENSTIX penicillin bougies or PENSTIX-SM, penicillin-streptomycin bougies (the combination antibiotic treatment for more severe infections) are available at your drug, feed or Animal Health Products store.

- For cows with dry quarters, or with more deep seated infections, many dairymen prefer WYETH PENICILLIN OINTMENT or PENICILLIN - DIHYDROSTREPTOMYCIN OINTMENT, in handy easy-to-insert tubes. Write Wyeth for your FREE mastitis booklet.

### SOCIAL SECURITY FOR HIRED MEN

**B**EGINNING January 1, farm owners must make deductions from salaries paid to their regular help and report them to the Collector of Internal Revenue. We cannot hope to give complete information on regulations because of the many angles involved. However, we have been advised that a new leaflet "Notice to Farmers with Regular Hired Help" is available from the Collector of Internal Revenue, your local Social Security Office, or offices of county agents or the Production Marketing Administration.

This leaflet explains how the farm operator can tell whether any of his employees are covered by the law. It also contains a tear-off slip, Form SS-4-a, which the farm operator should fill out and mail if he has employees who will be covered. This is an application for an identification number for the employer. Information about making quarterly tax reports, as well as reporting blanks, will be sent to farmers who mail this form to the Collector of Internal Revenue.

If you have not already obtained a copy of this leaflet, we suggest you do so as soon as possible. We are told that your local Post Office will have Form SS-5 available. This is the form which EMPLOYEES should use in requesting a Social Security number if they do not already have one. Also available at the Post Office will be Form SS-4, which should be filled out and sent in so that the EMPLOYER will get an identification number. Of course, the latter form, SS-4, won't be necessary if you have a copy of leaflet mentioned above and have sent in Form SS-4a.

In case you want to contact your local Social Security Office, we are told that you can get their address from your Post Office.

—A.A.—

Some people favor government in business because some men in private industry have been selfish and short-sighted. But electing or appointing a man to a government position does not automatically correct all his weaknesses. It may increase them!

## It Wasn't Their Fault

LACONIA, N. H. To avoid dangerous driving on the 4th of July, Mr. Ellsworth and his wife went to town on the 5th. On the way home, loaded down with groceries, it happened.

Coming head-on was a brightly painted, heavily loaded circus truck. Just as the truck got opposite them—Bang!—the front tire blew out. In a split second the truck plowed into the side of the Ellsworth car. They didn't have a chance.

At the hospital Mr. Ellsworth soon passed away. Mrs. Ellsworth was critically injured, fortunately she pulled through. Both were policyholders of the North American Accident Insurance Co. Mrs. Ellsworth received the limits in weekly benefit payments from her policy and full death benefit payments from her husband's policy.

Here again is tragic proof why all members of the family should have North American Protection.

# CA and WD turn a new page in farm power

apply tractor engine power **3** new ways

Here they are — Allis-Chalmers' latest! The new Model CA Tractor now steps out with its companion *two-bottom* plow — alongside the popular WD Tractor and its close-coupled *three-bottom* plow.

In keeping with Allis-Chalmers' policy, our power rating of these tractors is conservative. In extreme conditions, no, but in average soils, yes, they will handle these plow loads.

Both tractors are now equipped with **POWER SHIFT** wheel spacing that adjusts rear-wheel width by engine power.

Both have a quick-acting hydraulic

**TRACTION BOOSTER** that makes possible more actual drawbar pull. Automatically, the Booster increases weight on the drive wheels to match the load.

Both have **TWO-CLUTCH** power control, including an auxiliary hand clutch (optional on CA). Plus a four-speed transmission, built-in hydraulic control system for implements, hydraulic shock-absorber seat, low-pitch muffler, power take-off, drive pulley, lights, battery and starter.

Stop at your Allis-Chalmers dealer's soon for a look at the outstanding farm tractors of their time.

THE FARM PAPER OF THE NORTHEAST

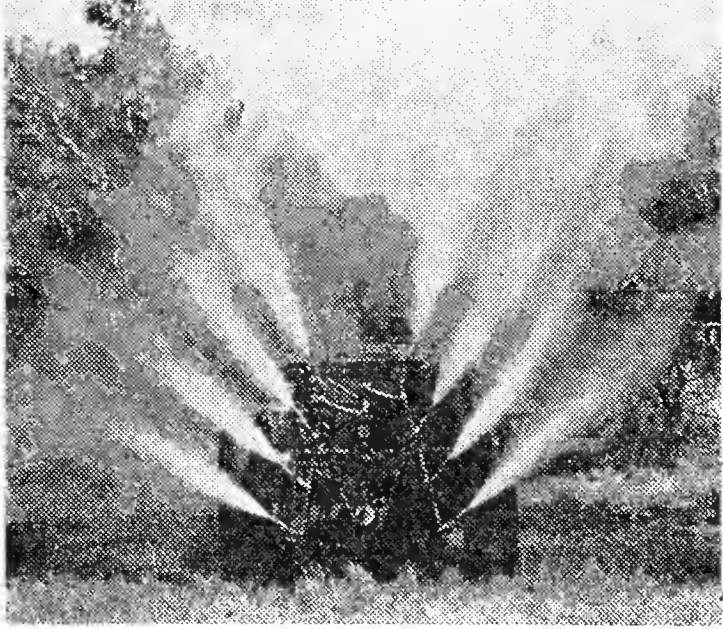

## *Saving Hours in the* **FRUIT ORCHARD**

*By Dan Dalrymple*

SECRETARY, NEW YORK STATE HORTICULTURAL SOCIETY

**A**S FRUIT growers, we are notorious among all farmers for our inability to cut down on the number of man hours per unit of production (in simpler words, the hours it takes to grow a bushel of apples). There are a number of reasons for this, the main one being our inability to develop mechanical fruit pickers that can see and think before they pick. Some of you may say that some human fruit pickers do not see or think either, and that they care no more than a machine about what they do to the fruit. But, as bad as humans are, they are, as yet, better than any machine developed. Likewise, up until 2 or 3 years ago, there had been no change in tools or time for pruning trees since the days of the Pharaohs.

The other main reason for not using more labor-saving devices is the perfectly normal human factor which causes us to get in a rut and like it. We just do not think our way out of our problems as much as we could. It is sometimes easier to do a job the old way than to think of an easier way. But, as labor has evaporated, growers have begun to use their ingenuity more and more, even as they have in industry, without quite as much success as in industry but with some hopeful trends.

### Winter Jobs

Fruit growers, at this time of year, are engaged in two principal activities, packing fruit and pruning fruit trees. A great many hours (and a great many apples) are wasted in packing fruit. Hours are lost minute by minute, waiting, stalling, smoking, booting the dog out of the way, and warming up fingers. A surprisingly large number of apples are packed in barns and will continue to be handled over from package to package. The manufacturers of grading equipment have not yet used enough ingenuity in cutting down the bruising of the apple of the Northeast—the McIntosh. Equipment that does avoid

bruising is very expensive for the small grower to purchase. Getting the apples out of storage, bringing them home on the truck, taking them off the truck, piling them, taking them off the pile and dumping them on the grader, piling them away and then repiling them on the delivery truck are all amazingly, wonderfully wasteful of time.

One grower told me that he worked under tension all summer and danged if he was going to drive himself all winter too. Maybe some lost time in winter is, you might say, necessary, or at least enjoyable.

### Good Planning

Saving hours in the grading process usually means that the owner or manager has to spend some time trying to get the people who are handling the apples to move their hands faster and with more purpose. This means careful organization so that six people are not waiting for two to do a job. In the storage, the use of more skids to move apples, without hand shuffling is extremely important. We have been able to save hundreds of man hours with 25 hand-operated skids and rollers. Those were hard hours too, the kind that make the back ache. As much as the equipment cost, it still pays for itself.

Growers who do not pack their own apples can save valuable time by getting their equipment in shape. This time of year, many growers are cleaning up machinery and following that up with plenty of good paint to save purchases and breakdowns. Nothing is more expensive than summer hours spent on a piece of broken machinery. Usually not more than two people can work on a machine, but these two are surrounded by all the other help in the vicinity, either tied up by the breakdown or just plain curious. Hours spent in the winter time getting machines cleaned up, new parts on and adjusted, are time savers, as are good hand tools and a farm shop that can be heated.

Now, let's get out in the orchard. Some days when you go out to prune, it's apt to be a little too cold. Some of our Southern colored help have demonstrated that a good rousing bonfire may be a good morale builder on such mornings. Perhaps a little gas stove in the trailer might help a bit. But the way most fruit farmers keep themselves warm outside

(Continued on Page 8)

TOP: A pneumatic pruner, the first new pruning tool in 2,000 years.

CENTER: Speed in spraying plus excellent coverage especially on the underside of the leaves.

BOTTOM: Packing apples—a steady winter job.

*They'll Be Husky Heifers  
Come Round-Up Time  
Next Fall . . .*

**B**OYS will be boys and calves will be calves—but not for long. All too soon boys become men. Even sooner, calves no longer are cute pets, but must be measured in terms of potential value to the dairy herd. Each calf is marked when born—to be eventually just another cow or a good milk producer.

Every year thousands of Northeastern dairymen are finding that by using G.L.F. Calf Starter they can give a calf the start needed to grow quickly to its inherited ability and at the same time save milk and feeding time.

Milk and G.L.F. Calf Starter go together for best results in raising a calf. (Because of the savings, many dairymen use a substitute for milk such as Calf-Kit.)

From three weeks on a calf will begin eating more and more Calf Starter with her milk diet. At about 8 to 12 weeks all milk can be eliminated and additional Calf Starter fed for it contains plenty of bone building minerals as well as growth and health promoting vitamins.

When the calf is consuming a good amount of high quality hay and some fitting ration the Calf Starter can be cut out. This usually comes at about 16 weeks of age.

This feeding plan is raising thousands of husky, healthy calves every year, and saving money for their owners. Have some G.L.F. Calf Starter on hand for the coming calf crop.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

**G.L.F.**

## New Jersey Boy Saves on Tools

THE Vocational Agriculture Department of the High School at Newton, N. J., has one of the best setups I have ever seen. The boys have a good-sized building all to themselves with classrooms and a good-sized shop where machinery can be run in to be repaired. It was vacation week when I was there recently, but I was lucky in finding one of the two teachers, Arley Haviland, who spent a good part of the day with me. We went out to Branchville to see Bill Heater who in 1947-48 was the State winner of the FFA Farm Mechanics Contest. Bill is a young fellow who has had to work for everything he has earned, and he certainly has taken full advantage of his opportunities.

In these days, equipment is expensive but Bill has pulled together a good inventory of equipment at small cost. For example, last spring he bought a used tractor for \$350. He painted it, rebuilt the carburetor, changed over a power takeoff, added a self-starter, and did enough other work so that Arley and he estimated that he could probably get \$600 for it if he wanted to sell it.

Among the other jobs Bill did was to build several trailers. One 6'x12' hay

BILL HEATER and the tractor which he rebuilt in the school shop.

rake; another 2-wheeled job for hauling behind a tractor. An old truck was bought and repaired. A body was built on it; it was re-wired and a starter and a generator were rebuilt. In the barn the stable was insulated and new stanchions built, and a small poultry house (12'x12') was erected. For better living, water was put into the house.

This is a small farm of 22 acres. Mr. Heater has a steady job and most of the work is done by Bill who definitely plans to become a farmer.

On the way back to Ithaca I stopped to visit the high school agricultural class at Honesdale, Pa. When I walked in, Wesley Eastman, the agricultural teacher, was waiting for a class, and naturally I was pleased to find that he was reading AMERICAN AGRICULTURIST. On inquiry I found that the boys in the class used it also. In fact, on the blackboard in the classroom were these instructions:

1. Make entries in project books.
2. Complete guest list for FFA banquet.
3. Write letters.
4. Learn from A.A.

Many Vo-Ag Departments use AMERICAN AGRICULTURIST with profit. All of them could!—Hugh L. Cosline

Some farmers  
want an  
"OPEN CENTER"  
tire . . .

Other farmers  
want the  
"TRACTION CENTER"  
tire . . .

ONLY  
**Firestone**  
**Has Both!**

YOU'LL find exactly what *you* want—in tread design, in traction power, in wearing qualities, and in extra-value features—when you buy Firestone tires. In BOTH Firestone Champions—the Open Center and the Traction Center—you'll find *all* of these outstanding advantages.

- **Curved and Tapered Bars** for stronger, cleaner bite.
- **Full-Width Tread** for full tread life and power.

- **Flared Tread Openings** for positive cleaning action.
- **Dual Shock Protectors** for full body life.

Yes, you can have the tread design of your choice and get the finest in quality, too, when you buy Firestone Champions. Only Firestone provides you with this choice. Only Firestone has all these extra advantages. So when you need tires, get Firestone Champions, either in Open Center or in Traction Center design.

**ALWAYS BUY TRACTOR TIRES BUILT BY FIRESTONE,  
ORIGINATOR OF THE FIRST PRACTICAL PNEUMATIC TRACTOR TIRE**

*Listen to the Voice of Firestone on radio or television every Monday evening over NBC*

## SUGGESTIONS TO LOCAL SCHOOL BOARDS

SCHOOL BOARDS, trustees and local school administrators are now faced with the most difficult job they have ever had in caring for elementary and high school needs. The number of children entering school is rapidly increasing, men school teachers are being drafted or leaving for other better paid jobs, school buildings and facilities are inadequate in some communities, costs of everything are rapidly going up and the dollar will go only half as far as it did not too long ago.

To meet these problems, school boards and the schools must have the understanding and wholehearted support of the local public. You never will solve your problems unless your public is with you. There is need for a much better job of "selling" education to the public, of making sure that the people know the kind of job that the schools are doing now, not what they did five or ten years ago.

Much more effort must be made to get people out to the annual school meetings. In most cases they attend now only when there is a row on. One reason why they don't attend is that the programs are dull and uninteresting. No wonder they don't come again! Meetings could be made more worthwhile by providing light refreshments, some good music, and perhaps a good speaker, and certainly a careful presentation of the local school business and problems. The meeting should be well publicized ahead, making mention of some of the interesting parts of the program.

The school meeting is one of the most democratic institutions we have left and is one of the least used. What's the use of talking about "grass roots" if we don't make them work?

It is suggested that school boards and school administrators can do more toward taking the public into their confidence. There could well be frequent open meetings of the board of education, or at least a few persons could be invited to attend local board meetings every time you meet, rotating the invitations so that a large number of people in your district will get some first-hand knowledge of what your work, problems and needs are, and what you are trying to do.

## LET IT STAND ON ITS OWN MERITS

"BE IT RESOLVED that we vigorously oppose any change in existing State Law barring the sale of yellow oleomargarine till such time as the Legislature devises a workable and enforceable plan to protect the public against fraud in the sale of oleomargarine colored to appear like butter.

"That butter supplies are adequate and there exists no need for State institutions to use butter substitutes." — *Resolution passed by the recent annual meeting of the New York State Farm Bureau Federation*

AMERICAN AGRICULTURIST is fully in accord with the above resolution. We do not have nor do we think dairymen can have any legitimate argument against the use of oleomargarine providing it is sold on its own merits. Coloring it to resemble butter is a fraud.

## NOW OR NEVER

THE other day a farmer and his wife stopped in at our AMERICAN AGRICULTURIST offices to make their reservations for our California Tour, which leaves for the West on Feb. 17. As they looked over the illustrated itinerary showing all the wonderful places we will visit, they were as excited as children, and they said: "We've always wanted to take an A.A. conducted tour. Now with the war situation we feel that this may be our last chance, and we're looking forward to it very much."

The money you spend to see America on this trip will bring you rich returns in friendships and mem-

ories all your life. If you want to go, don't put it off to a time that may never come again. Full details of places to be visited and cost of the "all expense" ticket may be had by sending today for the printed itinerary. Address: California Tour, AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y. Don't delay; tour dates are Feb. 17 to March 13.

## TO MEET THE FARM LABOR SHORTAGE

FARM wages increased 3½ times in the nine years through 1940-1949. Now with the present war situation good men will be more difficult to obtain and wages higher than ever.

To meet the acute labor shortage a comfortable tenant house will help. So will some kind of a share-the-profits plan. But even more than good wages, a cooperative spirit of give-and-take between the farmer and his employee will help the situation.

The best remedy of all, of course, for the shortage in farm help is good equipment—more labor-saving devices. In the next two or three years there will be a big increase in all kinds of standard and new field equipment, more gadgets to shorten steps and increase efficiency in both the house and barn, providing such equipment can be bought. Because many of the machines can be used only a short time during the year, and because of their necessarily high cost, I think farmers must give more attention to sharing machinery with their neighbors and to custom work.

One problem in further mechanization of the farm is the likelihood that machines will be in short supply again. This is the time to check your needs carefully, maybe talk over the problem with your neighbors, buy repair parts for the machines that you do have, and order any new machines you need while you are reasonably sure you can get them.

## TRY THIS GAME

THE Medical Society of the State of Pennsylvania proposes a set of New Year resolutions for health that are the best I have seen. After you have read these resolutions, try the game suggested at the end of them.

1. Resolve to eat good substantial food, including vegetables, fruit, eggs, meat, milk and other dairy products, and drink plenty of water.
2. Resolve not to over-eat.
3. Resolve to stand and sit straight.
4. Resolve to rest when tired, and sleep or at least spend eight hours every night in bed.
5. Resolve to bathe regularly and brush the teeth after each meal. Even just rinsing the mouth thoroughly after eating helps to prevent tooth decay.
6. Resolve to avoid persons who cough and sneeze and to protect others from your own infectious diseases.
7. Resolve to wear sensible clothing and footgear, and keep the feet dry.
8. Resolve to maintain a wholesome mental attitude on life and reject thoughts of hate, hostility and worry.

Now for the game. Make up a chart listing each of the above resolutions. Give each one 12½ points. Place your chart somewhere handy where you will see it and have access to it each night, and mark yourself on each point daily to see how high a total score you can get each day and each week. If you follow this plan I'll guarantee that your average at the end of four weeks will be much higher than when you started and you'll feel a lot healthier and happier. Maybe, then, you will keep the resolutions permanently.

To add interest to the game, AMERICAN AGRICULTURIST will pay \$5.00 for the best letter written at the end of the four weeks' period giving your ex-

periences in keeping these resolutions and the results in better health you think you get from them. We will also pay \$1.00 each for any other letters on this subject that we can find room to publish. Address letters to AMERICAN AGRICULTURIST, Box 367-N, Ithaca, New York, and have them in the office by March 1. Keep them short.

## GET YOUR ORDERS IN

SOME of the ingredients and chemicals in fertilizers, sprays and dusts, and materials for equipment and building purposes, are used in war materials as well as in farming. Better check your needs and order your supply now.

## IF YOU LIKE A GOOD STORY

"I wish to congratulate Ed Eastman on his recent story, *THE SETTLERS*, dealing with life in the early years of the nineteenth century here in the Genesee country. It is graphically written and full of human interest. I believe that nearly everyone who lives in the Genesee country would be interested in this book."—R.C.W., N. Y.

THAT'S RIGHT. But *THE SETTLERS* is equally interesting to everyone anywhere who loves to read a fast-moving love and adventure story about the pioneers who gave us America.

To order, send \$3.00 to AMERICAN AGRICULTURIST, Department TS, Savings Bank Building, Ithaca, New York, and a copy will be sent postpaid.—H.L.C.

## HE SAID IT ALL

"Because we have recognized defects in our economic and social system, there has been a tendency to ignore its obvious advantages. At times there has appeared to be a willingness to kill the patient in order to remedy his ills. Now, in the middle of the Twentieth Century, we must be clear about the value of our free system, and we must be positive in our efforts to maintain and improve it."

Allan B. Kline, President  
American Farm Bureau Federation

ONE could talk for an hour or write a book on this subject and yet not cover the subject of the need of maintaining our liberties better than Mr. Kline has in the above short paragraph.

## A.A. SALESMEN WELCOME

"Quite often the arrival of a salesman at my farm is a great nuisance, but I am glad many times that your salesman came and took my subscription to AMERICAN AGRICULTURIST."

—Ben Ward, Jr., Walden, N. Y.

## EASTMAN'S CHESTNUT

KATY JONES, who had been hired to teach school at Bear Creek because an "edicated" teacher couldn't be had, was standing on the stoop of the old schoolhouse one evening after school when an old fisherman passing asked her how she liked her job.

"Don't like it," answered Katy, emphatically, "and I don't give a dang who knows it. The twelve kids I've got to put up with is the unmindin'est, fight-calwin'est passel of freckle toters that ever stomped snakes with their bare feet. And first gent that comes along and wants a stout, young wife, I'm his'n! Right now!"

It was thirteen years later that the fisherman again came by the old schoolhouse, saw Katy Jones sitting on the stoop, and said:

"How many children do you have by this time, teacher?"

"Twelve," she said. "A dozen of the fight-claw-in'est passel of freckle toters that ever —"

"Why don't you graduate 'em out of this school?" asked the fisherman.

"Tain't a school no more," she said wearily. "The first man that came along bought it for our livin' house. These kids are mine. And now I don't git a danged cent for teachin' 'em . . . How's fishin', mister?"

# AA's Farmers' Dollar Guide

**FOOD PRICES:** Although prices of 18 out of 32 farm commodities are below parity, ceilings on food at present prices or below are being urged in some quarters. Argument is that rising food prices will result in demands for increased wages by labor. In other words, inference is that labor is justified in asking for more wages when living costs rise, but that farmers are not entitled to better prices as production and living costs increase. Food price increases in recent months are being emphasized without saying that those increases are a partial recovery from a sharp drop in '49. Truth is that all must reduce living standards if defense preparations continue as planned. Farmers will do their share, but don't want to do it all alone.

All brakes are off food production, with increases in cotton and feed crops most desired. USDA is reported worried over responsibility for food production, with little or no control over regulations and price ceilings affecting agriculture. Food price ceilings below parity will certainly reduce food production. Nevertheless, control machinery is being set up and ceilings at some future date are almost certain. Farm organizations will of course fight for a square deal.

**SUBSIDIES:** Unfortunately, there is some sentiment toward freezing food prices to satisfy city consumers, than attempting to satisfy food producers through subsidies. Food subsidies just kid the public. Furthermore, their administration costs plenty of money at a time when economy in non-defense expenditures is absolutely essential. Farmers should resist them for many reasons, including the fact that they tend to lessen understanding between producer and consumer rather than to increase it. Consumers view them as subsidies to farmers; actually they are subsidies to food consumers.

**CONGRESS:** Congress is showing healthy signs of reasserting its power and authority. Pleas for unity behind foreign policies cannot possibly be successful until that policy is re-examined and perhaps revised both in the light of our ability to meet commitments and the willingness of other nations to help themselves.

A backward glance indicates that previous lack of public questioning of many administration policies resulted from consumption of large doses of high-powered salesmanship from government agencies paid for by taxpayers' money. Instead of a developing public opinion at the grass roots based on facts and influencing government policies from the bottom up, those policies were decided at the top and then sold to the voters.

These trends affect future decisions about your farm business. Watch them!

**EGGS:** In the January 6 issue we discussed the probable effect of discontinuing price supports on eggs. The conclusion that prices may be lower than last year is not shared by everyone. While dropping price supports is a depressing factor, other factors such as high demand resulting from good wages, high meat prices plus low storage holdings of shell eggs and the fact that men in service eat more eggs than civilians may over-balance discontinuance of supports. Feed prices are higher and net result may be that egg profits will be about the same as last year. Anyway, efficient poultrymen won't need red ink.

**SOCIAL SECURITY:** If you have regular help either on the farm or in the farm home, study the facts about social security. Briefly, if you had hired help who worked 60 days during October, November and December, they will be covered by social security—if they also work 60 days during January, February, and March. The safe thing to do is to deduct 1½ per cent of their wages when paying them, then if they do not work 60 days during the first 3 months, this deduction can be refunded to them. If they do work 60 days, you, the employer, will mail a report and a check for the deduction plus another 1½ per cent which you will contribute, to the tax collector. If you missed it, check on page 27 of the January 6 issue for information about getting the necessary forms. —Hugh Cosline

## The Song of the Lazy Farmer

MIRANDY is the finest wife with whom a man could spend his life, but she's got one tremendous fault which I would somehow like to halt. She operates as if she might not be alive beyond tonight, and so she's always on the run for fear her chores might not be done, she figures that she must, some way, complete a month's work all today. The woodbox may be short one stick but even so she wants it quick, a speck of dirt can hardly land before a mop is in her hand, the level in the cookie jar is not allowed to drop too far; whenever her day's work is thru, she tries to do tomorrow's too.

Of course, that strange philosophy makes not a bit of sense to me; you can't do everything today, it just don't work out quite that way. You never really get ahead, you just invent more work instead; no matter how hard you might try, you just can't get all set to die, and if you work too hard each day you'll shorten your life anyway. What's wrong with loafin' now and then, it gives you extra pep for when there's work that simply must be done; besides, I find it's lots of fun. There ain't a chore I have to do but what can wait a day or two; of all the language I have heard, "tomorrow" is the finest word.

# You'll SAVE PLENTY of Time and Expense!

## New GULF improved all-purpose FARM GREASE

### One Grease For All . . . .

- Pressure gun or grease cup jobs
- Better cold weather pumpability
- Improved resistance to effects of heat and water
- Satisfactory rust prevention

Gulf's Research Laboratory spent two years in perfecting this new All-Purpose Farm Grease . . . to make it your biggest help toward more efficient machinery performance.

Save the bother and cost of several grease guns, several packages. Ask your Gulf distributor for the NEW Gulf All-Purpose Farm Grease, available in 5-lb. and 35-lb. cans.

Or write Gulf Oil Corp., Pittsburgh, Pa., for name of your

nearest GULF distributor.

Did you send for your copy of the new Gulf Farm Tractor Guide? Send the coupon, or ask your Gulf distributor for a copy when you phone for the new All-Purpose Grease.

## Iowa Farmer says... "Swift's New Process Blenn

**makes higher yielding corn crops"**

*"I have used Swift's BLENN for two years and am well satisfied with it. In comparison with another brand, BLENN fed through the corn planter attachment better, the corn matured faster, and the BLENN-fertilized corn yielded higher. Next year, I am going to use BLENN on all my corn and oats."*

*L. R. Bake,  
Oelwein, Iowa*

Good farmers, like Mr. Bake, strive for bigger yields of corn, oats and other grains. And they find the surest way to increase production from every acre planted is to feed their crops BLENN, Swift's specialized crop maker.

Here's why BLENN works so well. Feeding BLENN to crops is like feeding a good supplement to livestock. The growth elements in BLENN balance the natural plant nutrients in your soil. Then your crops get all essential growth elements needed... and that means higher yields, improved quality, and more money from every acre.

### **BLENN is chemically hitched**

New process BLENN is made by an exclusive method developed by Swift. Complete mechanical mixing is followed by complete chemical processing. All growth elements in the formula become chemically hitched together in each granule. Growth elements can't separate out as your planter joggles over the field.

### **More uniform 4 ways**

Swift's New Process also makes BLENN more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform distribution through your ma-

chines; 3) uniform freedom from caking, lumping, bridging; 4) uniform feeding of your corn and other crops.

You'll want to make sure you get all the New Process BLENN you'll need for your corn and grain crops. Shortage of plant food materials is again a possibility. So see your Authorized Swift Agent or dealer right away and order your BLENN.

**\$1.00 for plant food  
brings back \$7.00**

It has been found that a ton of plant food applied to a pasture will, on the average, produce 1,000 pounds of beef or 8,000 pounds of milk. Stated differently, each dollar invested in plant food for pasture will return up to \$7.00 in income to the farmer.

To help you grow better grass—America's greatest crop—we have prepared an informative new booklet, "A Guide to Better Pastures." We'd like you to have a copy. Please write to Swift & Company, Plant Food Division, Chicago 9, Illinois, and we'll send your copy on receipt of your letter. This booklet is free!

## The Question Box

**Can birdsfoot trefoil be seeded on hilly pastures without plowing and fitting the soil?**

The results from scattering seed without doing some fitting have not been good. In some places it is possible to fit the hilly land with a disk harrow more rapidly than you could do it by plowing. In general it is important to fit the soil before seeding and to add lime and fertilizer on poor, acid soil.

\* \* \*

**We are often told that growing cultivated crops reduces the humus content of the soil rapidly. Why is this so?**

Cultivation lightens the soil and increases the amount of air in it. This makes conditions favorable for the growth of the bacteria which cause decay of organic matter. Therefore, this decay proceeds rapidly and organic matter is used up rapidly.

This has one advantage in that it makes plant food available to growing plants, but it does have its disadvantages so far as soil is concerned. There are only two answers: (1) add organic matter, for example in the form of manure, or (2) grow it either as a cover crop or by including grass in the rotation.

\* \* \*

**Would you please explain the procedure for taking oil out of a leather belt?**

The best suggestion we can make is to wash the belt with any one of the ordinary dry cleaning fluids, the same type of fluid as used for cleaning clothes and other fabrics. This procedure will remove the mineral oil that has gotten into the belt as a result of over-lubrication of the tools on which it has been used. It will also remove the natural oil in the leather so for that reason it will be necessary to dress the belt with any good belt dressing compound just as soon as the dry cleaning fluid has evaporated out of the leather. If this is not done, the leather will be dry and is likely to crack.

—Paul R. Hoff, College of Agriculture.

\* \* \*

**Is it probable that northeastern hill lands often called "submarginal" can be used profitably for food production?**

After seeing the type of land used for range in the West, the poorest northeastern hill land looks very good. Some things that have held back profitable use are: 1. Such land is often taxed too high; 2. It is difficult to buy enough of it in one block; 3. It often costs too much money. One of the favorable developments is that it is much easier to deliver lime to such land by truck than it was with horses.

\* \* \*

**A little while ago I had my house painted, but I have noticed recently that the nail heads are rusting through the paint on the siding. Is this the fault of the paint or the nails?**

The condition which you mention is quite common. It is quite possible that it was neither the fault of the paint nor of the nails. In the process of driving the nails a considerable amount of the rosin was likely removed. However, the paint should have adhered to the nails and offered some protection. In the course of a few years the paint will wear off and the nail heads will become exposed to moisture and the rusting process will begin.

We have an experimental paint panel here at the University which is exposed to the weather and has siding painted with paints of various manufacturers. In nearly all cases, there is some evidence of rust on the nail heads.

Before you repaint your house, it would be advisable to drive the nails far enough into the siding so that the

heads will not be exposed, providing finishing nails with small heads were used. If common nails were used, this would be more difficult because the larger nails would crush a considerable amount of the wood fibers. However, if common nails were used, they can at least be driven in so that the heads are flush with the surface of the wood. Care should then be taken to see that the nail heads are well covered with paint.—D. W. Bates, N. Y. College of Agriculture.

\* \* \*

**Is there any truth in the idea that diseases and insects bother crops less when they are grown on soil that is well supplied with humus?**

There is some evidence to support such a claim. The enthusiasts for organic agriculture think that is the whole answer. More conservative scientists and farmers wonder where the necessary humus is coming from. Everyone agrees that it is desirable to add humus to the soil, but under ordinary conditions there is a distinct limit in the amount that can be added in any definite period. It looks as though we are going to have to spray for some years to come.

## It's Handy

### USING OLD PIPE UNIONS

Not long ago the writer hunted through his scrap box for something with a hole through it that could be used as a shim or block, and he stumbled onto this kink. He was bolting some steel shelving to a wall, and in one place a gap of about 1 1/2 inches had to be maintained rigidly.

An old pipe union proved to be just the thing, as shown in the sketch. The writer used two of its three parts. The threads, as will be noted, give the desired adjustable feature with a variation range of about half an inch. It served the purpose perfectly. It is substantial, looks good, and is not a temporary, makeshift job. Large unions may be used as well as small, depending on the fixed distance wanted.

Where distances to be held are greater than the length of a union, a nipple and coupling can be used in the same way.—W. F. Schaphorst.

—A.A.—

### CLOTH AND TALLOW REPAIR FOR PIPE

Here is a simple repair for a split or leaky pipe which I have found very convenient and useful for pump pipes, cold water pipes, etc. Dip a strip of muslin or other strong cloth about six inches wide and two feet long into hot beef tallow and apply as hot as you can handle around the leaking spot in the pipe. If the split is long, a longer strip of cloth will be required. Wrap as tightly as possible, and tie with good stout cord, or wrap with wire. I have pipes fixed this way which have stood in my well for 12 years without any further trouble, as I am always careful not to disturb the wrapping when I handle the pipe.—I.W.D.

# SAVE FARM DOLLARS WITH **NEW FORD TRUCKS for '51**

*Truck-of-all-farm-work is this Ford Series F-5 . . . only Ford gives you a choice of V-8 or Six with Power Pilot Economy.*

**NEW** Ford step-ahead engineering brings  
you greater economy—better performance!

Rugged, money-saving Ford Trucks have long been the farmer's favorites. And these new Ford Trucks for 1951 will be even greater favorites. Ford's step-ahead engineering offers NEW strength that prolongs truck life . . . NEW massive, modern front end that makes Ford the style leader . . . NEW cab features to improve riding ease . . . NEW all-around values to *save you money!*

**NEW** Over 180 Models—95-h.p. Pickups  
to 145-h.p. BIG JOBS!

NEW! Car-like shifting ease with new steering column gear-shift in Series F-1. NEW! 5-STAR and 5-STAR EXTRA Cabs with extra-wide rear windows for 50% more safety vision. NEW! Top engine performance is maintained with new autothermic pistons, new chrome-plated top piston rings and new high-lift camshafts.

## NEW 6½-FT. PICKUP

*America's No. 1 farm truck, the Ford 6½-ft. Pickup has a new body with hardwood floor, new grain-tight tailgate. Choice of V-8 or Six, both with Power Pilot Economy.*

FORD TRUCKING  
COSTS LESS because

In the low-price field  
**ONLY Ford Trucks give you  
POWER PILOT  
ECONOMY**

THE Ford Truck POWER PILOT is a simpler, fully-proven way of getting the most power from the least gas. It *automatically* meters and fires the right *amount* of gas, at precisely the right *instant*, to match constantly changing speed, load and power requirements.

Unlike conventional systems, the Power Pilot uses only *one* control instead of two, yet is designed to synchronize firing *twice* as accurately. You can use regular gas . . . you get no-knock performance. Only Ford in the low-price field gives you Power Pilot Economy!

*5-STAR EXTRA Cab shown available at slight extra cost.*

*Using latest registration data on 6,592,000 trucks, life insurance experts prove Ford Trucks last longer!*

## Atomizer • Sprayer • Duster

The PASTEUR — revolutionary contribution to more efficient, more economical insecticide application—is so NEW that it means a wholly different — and pleasantly different — idea of spraying equipment. Here's a single machine, getting its air-blast from a simple V-Belt-driven centrifugal pump, that applies any known type of insecticide in concentrate or dilute form to any type of crops, with savings of insecticide, time and water. The Pasteur is simple to operate; maintenance and first costs are low.

High trees diffuser  
Row-crop diffuser  
High-vegetation Row-crop diffuser

### One Machine For

- Dry Dusting
- Wet Dusting
- Aeromisting
- Conventional Spraying

### One Machine For

- Orchards
- Row Crops
- Vineyards
- Citrus Groves
- High Vegetation Row Crops

The PASTEUR adapts easily to fit your spraying job. Fingertip controls for instantaneous switching from dust to liquid or simultaneous application of both. Low pressure liquid output and high-speed, accurate air blast assure complete coverage without clogging. Mechanical tank agitation and adjustable controls for correct mixture and droplet size. Mail the coupon today for full information about this remarkable *dollar saving machine*.

## Saving Hours in the Fruit Orchard

(Continued from Page 1)

is to keep moving, with good boots and earlaps and plenty of pants.

Sharp saws and clippers are great time savers. One of my neighbors spends most of his time sharpening saws and clippers for his pruning help. He feels that he can do more sharpening tools for 4 or 5 men than to do pruning himself.

Many larger orchardists and some smaller ones are now availing themselves of pneumatic pruning tools. These show the first real progress in pruning made in 2,000 years. They take a great deal of the drudgery out of pruning, and cut down considerably on time. Personally I have not been able to get through the orchard much faster, but we are probably doing twice as good a job.

### Chain Saws Handy

Pneumatic pruning saws are in the experimental stage, but even the most ingenious workers have not yet developed one which is at the same time reasonably safe and effective. Gasoline-powered chain saws are saving hundreds of hours on fruit farms that are doing heavy cutting jobs. Tree removal has been stepped up considerably by their wide use. In fact, there would have been practically no tree removal without this chain saw, plus the bulldozer to take out the stumps.

One grower in Michigan hitched up a gas-driven dynamo to a portable trailer and hitched on a small electric chain saw which is lighter and more effective than the gasoline type. With this he was able to do pruning and topping with a chain saw up in the tree ahead of the smaller limb and twig pruning operations. Handling such equipment takes an unusual worker and is at best quite dangerous to hands and feet.

As was reported a year ago at the Horticultural Society meeting, and later in AMERICAN AGRICULTURIST, a number of growers are supplementing the use of air pruners with pruning platforms built on trailers and wagons. These platforms sometimes have swinging catwalks which enable the operator to get into the tree without climbing up and down a ladder to cut off one limb. Power take-off arrangements on tractors to run the air compressors needed for pneumatic pruners seem to be the most efficient setup. Deep snow in the orchard makes pruning with this system somewhat difficult. We have found that it pays, even if the caterpillar has to be used to get the wheel tractor and pruners through.

Systems of pruning can also be utilized to save time. If the man doing the pruning has some definite plan in mind, he is much less apt to fiddle around cutting a twig off here and a twig off there. If, for instance, he follows a system of cutting corners out of each tree as he comes to it, the operator can get quite a lot of wood out without as much study.

And now, with a few strokes of the pen, the brush is on the ground. In Michigan, Don Hottman tells me that he always knows that things are normal when he goes from Grand Rapids to Benton Harbor and sees two-thirds of the farmers fishing through the ice and one-third pruning. If there are more growers pruning, he knows prices are up. If there are more growers fishing, he knows prices are down. Of course it should be the other way around—the lower price, the more pruning should be done; but most of the time farmers, being human, do not behave in a logical fashion.

Of all orchard jobs, getting the brush out of the orchard is the most exasperating to me. Usually the last man hired is the one who is told to fork the brush out from under the tree into the middle. This requires a great deal

concentration (on something else besides what he is doing) on the part of the worker. It's a wonderful time for day-dreaming. But ingenuity in brush handling is really beginning to produce results. Newer tractors with hydraulic systems are being utilized with small brush pushers which will go under the trees, raise the brush up after it is gathered on the tines and move it out into the main driveways where bigger tractors with bigger pushers can get it into the fire, ditch, or lake, whichever is best. We found that a steel brush pusher could be made if it is properly designed. It has to be built of a good-sized angle iron with proper pitch to keep the tines from running head on into the ground every time the front wheels of the tractor go down.

With these few words, the brush has now been pruned and burned. A few hardy souls have tried to chew up their brush with choppers. This gets rid of the brush but does not get rid of the man hours, and certainly adds to the total cost because of the gasoline used up. The rather questionable benefit of ground up brush in adding humus would not be apparent in most of our lifetimes.

Generally speaking, if the ground is dry enough, pruning is followed by tree planting. Here I have viewed with a great deal of envy one neighbor who has a power take-off on an auger on the back of his tractor which, in a few seconds, bores a very adequate 2-foot hole just right for setting in a tree. Each year I spend more time in planting trees than the tool would cost. Maybe my envy will overcome my avarice if we can plant enough trees this spring. Tom LaMont of Albion has recently worked out a system of planting trees that is described in the last Horticultural Society News Letter. We shall be glad to send you a copy of this; or you can go down and watch Tom do it.

### The Handiest Outfit

In all our farm operations the most popular and most used single tool now on the farm is the tractor hooked to a trailer. This outfit is used almost every day in the year, hauling spray material up and down the lanes; hauling the pruning platform about the orchard; gathering up brush in inaccessible spots; spreading nitrates; carrying fruit trees around to be planted; hauling cabbage and cull apples off to the open fields in early spring days when we finally lose faith (usually just before the market goes up). Then all through the summer the 2-wheel farm trailer is a big time and back saver.

Now we are getting ready to spray. The last lingering doubt I had about sod orchards left me the first spring day I took a tractor and spray rig out into an apple orchard that had been culti-

(Continued on Page 21)

## Out of Balance

WE REALIZE that the spread which a handler gets for apples or any farm product is not profit. Cannery fail; wholesalers go broke, and retailers, finding that expenses are bigger than receipts, close their doors. Farmers also go bankrupt, often not so quickly because most of the work is done by themselves and their families and is not a cash cost.

We know, also, that the expenses of doing business are largely made up of

### WHO GOT THE 15 CENTS FOR APPLESAUCE?

ITHACA, N.Y., NOV. 1949  
NO. 2 CAN

high cost labor. Admitting all these things, the graph above showing the percentage of the retail price which went to the various interested parties still does not make sense. Undoubtedly, the retailer has his expenses and his risks, but by no stretch of the imagination can we see that for these expenses, risks and profit he should get an amount equal to that which the grower gets for his work of setting, pruning, spraying, picking, packing, etc. If the canner, wholesaler, and retailer cannot do their part of the marketing job for less money, the retail price should be upped to give the grower a fair share for his job.

— A.A. —

## Selling Potatoes

GREATER interest should be taken in the effort to study consumer preference in the size and condition of Maine potatoes as they reach the retailing stores.

With increasing consumer confidence and demand as an object, the efforts of the Maine Experiment Station to study the Portland market are particularly timely. Dr. Charles Merchant, of the Station, has approached the problem from a novel angle. This was no peck basket study or store window inquiry, since five and one-half carloads were purchased, packaged and sold by the Station to determine just what the Portland housewives prefer. Fifteen pound packages were displayed in supermarkets. Size of the potatoes were from one and seven-eighths to two and one-half for the small potatoes, two and one-half to three and one-quarter for medium and three and one-quarter to four for large and extra large. Also a mixed size ranging from one and seven-eighths to four inches.

When the same price was put upon all sizes, about four bags of medium size were moved to every two of mixed sizes. When the small size was offered at a lower price and the medium size the highest, consumers carried away about three and one-half bags of the small to every two of medium.

All consumers were interested in careful sizing. Few cared for very large potatoes. Some bought on price only, some picked for graded stock. Total consumption would surely be increased if all stock offered for sale could be sized.

—F. P. Washburn.

# It's Here.... CASE AUTOMATIC BALER (TWINE)

✓ Simple, Dependable Self-Tying Unit . . . Plus  
All the Advantages of Famous "NCM" Baler

✓ Makes Firm, Neat, Full-Weight Bales Tied to  
Stay Tied With Heavy-Duty Twine

✓ Bales Ventilated for Fast, Even Curing . . .  
Sliced for Easy Feeding

Never before a baler like this! Developed from the famous Case "NCM" Slicer-Baler, this new automatic baler gives you all the advantages of the "NCM" plus simple, positive automatic tying. It offers you new ease, speed and economy in baling . . . simple construction for easy operation and upkeep . . . strength and long life with light weight.

A continuous stream of bales from bale chute to wagon hustles your haying . . . enables you to put hay up promptly to keep the precious, protein-bearing leaves and green color. Ventilated bales, for even curing and clear-through quality, are sliced for easy feeding. With a Case Latch-On or Trailer Mower, tractor side-delivery rake, and this automatic baler, the three simple steps to quality hay are easier than ever. Get the full story—see your Case dealer now.

Case tractor rake has 4-bar reel, geared to handle hay gently, work fast. Builds fluffy windrows with leaves mostly inside, stems out, for quick, even curing. Roller-bearing model available.

Case Latch-On mower hooks up quickly to Eagle Hitch of low-cost "VAC" tractor. Hydraulic control lifts entire mower for transport.

## Empire State 1950 4-H Dairy and Livestock Champions

By HAROLD WILLMAN

**E**IGHT outstanding 4-H'ers were recently chosen as the 1950, N. Y. State 4-H Dairy and Livestock project champions. To receive this recognition, is one of the finest honors that may come to a farm boy or girl, so say several former State 4-H winners.

Many qualities are considered by the awarding committee in the final selection of these winners. These considerations include years in 4-H Club work, completeness and accuracy of project records, participation in dairy and livestock activities, local leadership and the development of flocks and herds. Much emphasis is placed on the use of approved practices, number of animals owned and bred by the 4-H members and the influence that their project work has had on other people.

### State Winners Receive National Recognition

Among State dairy champions are Joseph Fisher, Canastota, Madison County, representing the Holstein breed; Gordon Hilton of Altamont, Albany for Jerseys; Robert Carey of Locke, Cayuga for Guernseys; Herman Hensel of Batavia, Genesee for Ayrshires and Alfred Angus of Johnstown, Fulton County for the Brown Swiss breed.

Among the meat animal feeders and breeders, those chosen included Edmund Gleason, Jr., of Groton, Tompkins County for beef cattle; Warren Lawson of Pavilion, Livingston County for sheep and Richard Kahelin of West Athens, Greene County for swine.

Joseph Fisher after winning the New York all-breed dairy achievement award of a gold watch, also was selected as the Eastern sectional trip winner to the National 4-H Congress at Chicago, where he was named one of the National scholarship winners. Richard Kahelin achieved high honors too when he won the New York meat animal grand award of a watch and a free trip to Chicago to attend the National 4-H Congress as the Eastern sectional meat animal project winner.

### Competition Keen

Those named as champions in New York State for 1950 had plenty of competition. Forty eight counties nominated 282 of their most outstanding dairy and livestock workers. These county champions of the state, now

owners of 2,104 head of livestock and dairy cattle, represent over 9,000 other members. It is impressive to note that these champions average over 16 years of age and have stayed in club work for an average period of 5.8 years.

The eight state champions also averaged 19 years of age, and three of them on reaching 21 years of age have just grown out of club work by age. They all started club work in much the same way and their progress has been quite similar. For example, from their original start, the five dairy champions alone own 89 head of stock and, over the years, have sold 60 head. Thirty-two head of their dairy cattle have been daughters or grand-daughters of either their first, second or third purebred calves.

In general the growth of the dairy herds owned by the champions was gradual and on a sound basis. Herman Hensel, for example, reported that "his herd has been maintained under Bang's Control plan A, in which all heifers are vaccinated and all cows blood-tested annually." Yearly TB tests and mastitis control also had been a part of his herd management program. Herman is now a student at Cornell having found that the income from his herd has made it possible for him to continue his education.

Gordon Hilton's story is much like that of the other champions. His herd has grown to 33 registered Jerseys and recently he purchased out-right the home farm where he will continue to breed Jersey cattle. Joe Fisher has assumed the major responsibility of managing the home herd of 90 head of Holsteins. He is quite proud too, as he goes about his daily work, that his first calf as a 9 year old is still in the herd. This cow just completed a 320-day DHIA record of 18,000 pounds of milk and 587 pounds of butterfat. Robert Carey started with grade cattle but soon added two purebreds and now has a herd of 9 head of cattle of his own. As the Alfred Angus herd quickly developed to 18 head he has been busy selling the idea of Swiss cattle to some of his neighbors. Alfred has found that calf-hood vaccination, wide and roomy well-bedded stalls and good management have been valuable practices in the handling of his cattle.

Not to be left out of the picture, Richard Kahelin has sold 184 hogs

(Continued on Opposite Page)

Herman Hensel

Joseph Fisher

Warren Lawson

Gordon Hilton

## EMPIRE STATE 1950 4-H DAIRY AND LIVESTOCK CHAMPIONS

(Continued from Opposite Page)

since he bought his first pigs and still has a few left. Dick also is an outstanding dairy and poultry member and now is a leader in his community. Edmund Gleason has fed and sold 9 head of baby beef steers and has been active in most every other phase of the entire 4-H program. Warren Lawson, 7 years in 4-H sheep work, not to be out-done, now has a half interest in his father's 250 head flock on the home farm where he will continue to breed purebred sheep and probably Suffolks based on his present breed interests.

### Other Excellent Achievements

The work of many of the other county champions show evidence that they may attain the same sort of success which the State winners so far have achieved and earned.

Among the Jersey members who gave Gordon the most competition were Grace Walters of Broome County; John E. Johnson, Delaware; Frances Wollner, Erie; Alton Dewan, Lewis; Ronald Myers, Madison; Donald Gondeck, Onondaga; Ames Brown, Orange and Ruth Cook, Steuben.

The closest contenders for the State Guernsey award were: Larry Bush, Greene; Leslie Rathbun, Otsego; Duane Dennis, Wayne; Richard Lind, Chautauqua; Theodore Sweet, Dutchess and Virginia Hilfiker, Orleans County.

On Holsteins the runners-up were: Robert Snyder, Allegany; Robert Hotaling, Broome; William Behling, Cayuga; Avery Stafford, Clinton; Franklin Pells, Columbia; Lowell Freeman, Erie; Oscar King, Franklin; Richard Kahelin, Greene; Alfred Morton, Monroe; Kenneth Fox, Montgomery; Peter Gibson, Niagara; Kenneth Roberts, Oneida; Charles Johnson, Orange; Arnold Cope, Otsego; Bernard Rodee, St. Lawrence; Ralph Kent, Steuben; Roger Hoornbeek, Ulster; Orrin Brusie, Dutchess; Bernard Shafarzek, Sullivan; Esther Witter, Allegany; Margaret Ross, Erie; Ruth Schneider, Lewis; Shirley Rohring, Niagara; Mary Ellen Wolverton, Schuyler; Hilda Sauer, Kyserike, Ulster; Helen Story, Washington and Carolyn Zetterman, Chautauqua, and Jeanne Pendergast of Onondaga County.

The nearest Brown Swiss competitors of Alfred Angus were Kenneth Leonard, Chemung; Ray Berry, Jefferson; Wolcott Stewart, Livingston; Richard Byrnes, St. Lawrence; John Cross, Kyserike, Ulster; Charles Carlson, Chautauqua; Jeanette Klotzbach; Genesee; Joyce Loson, Lewis; and Mary Jane Myers, Schoharie.

With Ayrshires, those next in line were, Dick Cook, Franklin; David Porter, Jefferson; Harold Hancr, Rensselaer; Robert Long, Seneca; and Nancy Nary, Wayne County.

Five other beef feeders and breeders also had excellent reports and stood close on achievement to Edmund Gleason. These members were: Wayne Keller, Genesee; Fred Bolauowski, Oneida; Homer Carr, Otsego; Robert Long, Seneca; Mary Ann Smith, Wayne.

The top hog club members were: Richard Dutcher, Cayuga; Wayne Toal, Genesee; Stewart Anderson, Livingston; John Walrath, Otsego and Ralph Bliet, Wayne.

On sheep club work, the following should be recognized for their efforts in the care, feeding and management of sheep and for their achievements as all-round 4-H Club members: Richard Bitterman, Erie; James Dunham, Madison; Patricia Pierce, Niagara and Sammy Adams, Wayne.

## The March of Dimes

WHILE January 15 to 31 is the official March of Dimes time, the annual campaign of the National Foundation for Infantile Paralysis, it is possible to make contributions to this worthy cause at any time during the year. This year's campaign is especially important because the results of it mean the difference between carrying on as before or facing a downward revision in the program because of lack of funds.

Last year there were 5,500 cases of polio in New York State, and this year over 4,000 cases. As a result, New York State spent over \$1,500,000 and about half the local chapters are operating on advances from a National Emergency Fund.

In addition, the National Foundation is financing the most extensive research program ever leveled at a single disease by a voluntary organization. Seventeen universities and other institutions throughout New York State are currently working on various projects.

It has been said that only the very poor and the very rich can afford unusual medical care. Not so with Infantile Paralysis, which is an unusually costly disease. A good percentage of the families assisted by local chapters are in the "middle class" or "white collar" group. If polio strikes, the Foundation offers financial assistance immediately, according to the need. If you want the National Foundation for Infantile Paralysis to continue its work, be sure to make a contribution this year to the March of Dimes.

## "I've brought your telephone"

The above scene was repeated over a quarter of a million times during the past year. Throughout 1950 an average of 1000 Bell telephones were added every workday in the rural areas we serve.

In doing this, we strung 130,000 miles of wire and built 15,000 miles of new pole line—real evidence of our continuing efforts to further extend rural telephone service.

The quality of rural service has improved steadily, too. Nine out of ten farm families have

modern-type telephones. The great majority of rural party-line customers are now on lines with eight or less neighbors. And through improved ringing, each party hears fewer rings.

Solid progress was made in the last twelve months—yet there is still more to be done. We plan to move right along, continuing our effort to bring more and better telephone service to the rural family.

### Personal To Women With Nagging Backache

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief — help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

### Why Not Tap All the Trees You Can?

We can ship from stock, Buckets, Covers, Spouts, Tanks and all supplies and an EVAPORATOR in time for sugaring if order is placed at once. Send for circular and price list and tell us how many Buckets you hang.

G. H. GRIMM  
COMPANY  
Rutland, Vermont

## The Lost Art of Carving Meat

By ROMEYN BERRY

**W**HEN Grandfather carved a four-rib standing roast or a twenty-pound turkey for a family of twelve—or even a pair of ducks—the performance was a noteworthy act. Small boys forgot their appetites momentarily in admiration of the skillful surgery that Grandfather displayed. The slices came off evenly and piled themselves neatly at the side of the platter. There was no uncertain hacking around. The joints were located at the first try and severed by a single deft twist.

In those days boys learned to carve by watching, just as now they pick up the trick of driving a car or playing second base. Grandfather was a good carver and knew it. I suspect there were times when he put on some extra flourishes just to impress the small fry.

Carving meat in the home is rapidly becoming a lost art. One cause of this, no doubt, is the disappearance from the home table of meat to carve. You cannot learn anatomy of birds and edible quadrupeds, or the trick of carving them, by dishing out spaghetti and meat balls or from operating on a veal loaf.

A roast duck appears so infrequently nowadays on the American dinner table that few householders ever get a chance to learn that in a duck the important joints are located not on the sides, as in a chicken or a turkey, but way around in the middle of the back. Consequently the current crop of family men, unfamiliar with the bony structure of the duck, either hack the poor bird apart any old way, or else have it squirt off the platter under pressure and land in the black taffeta lap of Aunt Augusta. Grandfather would have shuddered and recommended that such as these confine themselves to serving bacon and eggs.

Grandfather's noteworthy success in carving was based, I'd say, 30% on having the proper tools to work with, 30% on knowing how to use them, and 40% on knowledge of the structure of the animal with which he dealt. In the first place the platter had to be large enough to leave room on the sides of the bird or roast to catch the pieces as he cut them off—with no encircling clutter of garnish to push off on the table cloth and make spots. There was always, too, a selection of newly sharpened knives beside the platter for him to work with; one for slicing, another for severing joints, and a third as a spare to use in emergencies.

Furthermore, Grandfather always stood up to carve anything more complicated than a rump steak. He would no more have thought of operating on a roast chicken or a leg of lamb in any other position than a surgeon would

consider removing your appendix while squatting.

Oh, well! I realize a man can't have everything. To each generation its own arts and skills! Grandfather would have made a shameful exhibition of himself if he'd attempted to back a Pontiac into a snug-fitting parking space on Main Street, and would surely have dented a lot of fenders and gotten himself a police ticket if he'd tried. On the other hand, he was quite capable of hitching up a horse and buggy in the dark, and knew the meaning of "three wraps, underneath and in the second hole," which is, I suspect, a meaningless expression to all expert car parkers under the age of 72. But, my good gracious! How Grandfather could take apart a stuffed goose and pass it around!

And the time the Ladies Aid Society put on a whole roast pig supper at the Dutch Reformed Church and Grandfather was called upon both to ask the blessing and then carve the pig that had been roasted whole! That was talked about for years. The blessing was a special one he'd prepared for the occasion and it took quite a while. But the carving was prompt and expeditious. Grandfather was all over that pig within a split second of the Amen, and he had sixty of the parishioners served in practically no time.

I can think of a number of men quite capable of preparing and asking a special blessing for a whole roast pig supper; of one or two, perhaps, who could still carve a whole roast pig, give 'em time and plenty of elbow room. But I'd be put to it nowadays to name one who could do both. Good carvers seem to be going out like the passenger pigeons, and blessings aren't what they used to be, either.

## Rural Radio Network Ithaca, N. Y.

Owned by ten leading farm organizations in New York and prominent Northeast newspapers.

### What Listeners Say About RRN---

Best hour-after-hour programs on the air. Useful farm information. Fine choice of music selections. Interesting weather report set-up.  
—Naples, N. Y.

I am a new FM listener. I like the Rural Radio Network so much that I listen to scarcely anything else.  
—Taberg, N. Y.

Rural Radio Network is indeed a boon to the farmers.  
—Hemlock, N. Y.

Your report on farm legislation, specifically the price support program, surprised me by its long-range viewpoint. The science discussion at 1:15 was exceedingly well presented.  
—Whitingham, Vt.

As a farmer's wife and retired home demonstration agent, I am particularly interested in Rural Radio. First I want to express my appreciation of many of your programs. I am especially enthusiastic about your choice and presentation of musical programs. The limited amount of "be-bop" is a welcome relief from other stations. I get a great deal of enjoyment from the semi-classical and some classical. I feel the tone of your musical programs expresses respect for the good taste and intelligence of rural people.  
—Cortland, N. Y.

I am greatly interested in FM radio and its present and potential benefits to us farmers.  
—Evans Mills, N. Y.

### KEEN OBSERVATION

MY daughter and I were very much interested in "Sunnygables Poultry" on page 18 of the November 18 issue. My daughter has also found that pullets that dodge around the flock do not pay. From 600 baby chicks (including 10 or 12 roosters) she has room for 250 by not crowding. The buyers who truck to the New York market only offered 33c when she was retailing at 45c live weight. It is a lot of work to dress them, but as she culls the year around the market is of considerable value. She dressed 30 in one day, and they are as fat and plump as the layers. She also has Rock Red black cross that average from 5 to 7 pounds at 7 months. I watched her dress them and not one had a yolk larger than bird shot out of the 150 to 200 that she had dressed. Just two laid and they may have been culled for bad pen habits.

A neighbor of ours bought over \$600 worth of pullets from a man who was short of housing facilities, and only a small percentage of these laid. I believe it is not safe to buy pullets from one who understands culling.

If Mr. Conner will keep an account of how many of the culled pullets die up until they are ready to lay, as well as the others, too, along with the cost of feeding them up until that time, and the price of eggs now and then, I think it would be of great interest to poultry keepers. This is where keen observation and diligence to detail pay off.

—F. A. Durland, Monticello, N. Y.

—A.A.—

### HEAVY TRUCKS RUIN ROADS

I HEARTILY agree with you that heavy trucks should be made to pay for the use of the roads in proportion to the damage they may cause them. However, I think the boys in our legislature are the ones we must work on to get this done.

The *Saturday Post* recently printed an article on the measures used to prevent overloading of trucks in Pennsylvania and Maryland. If we could or would co-ordinate our laws with other

Eastern States, we might get somewhere.

Right now, we are preparing the budget for our Town (which is predominantly rural) for 1951. I was reared when a dollar was worth 100 cents, I also paid for a \$20,000 farm through the depression in the thirties; and having earned my dollars the hard way, I am appalled at the disregard shown by public officials and employees of the value of the taxpayer's dollar.

Our town budget will be about 50 cents per \$1,000 higher next year in spite of everything I can do. Our county budget will also be higher, and, of course, the state and nation. It would seem that the inflationary trend is like a snowball; the farther it goes, the larger it gets, and what the outcome will be I cannot foretell.

My only answer to the situation would be to fire about half of the public officials and make the other half do the work. They would not be overworked if this were done. Of course, I know that this will not be done in any branch of the Government, as it is not the trend of the times.—R. W. Beecher, Lima, N. Y., Supervisor, Town of Livonia.

—A.A.—

### POPPING CORN

In the November 18 issue of AMERICAN AGRICULTURIST, under the heading "Question Box," there is a note asking why home-grown popcorn doesn't pop satisfactorily.

I have found that if the corn is fully matured and dry enough to shell easily, it can be kept in either a glass or tin can in your refrigerator, where the moisture is always more or less the same. I have kept corn this way for years and, whether it be winter or summer, it never fails to pop.

—Mrs. Otto Stevenson, Weedsport, N.Y.

—A.A.—

Thank you for your letter of September 13 and the good information that has come in response to your efforts to answer my various questions. You are a potent source of information and help for us struggling farmers. Thank you ever so much. — Mrs. F. Lynn, Rochester, Vt.

## Management and Sanitation Pay Off in MASTITIS CONTROL

By Dr. H. G. Hodges

Supervising Veterinarian, New York State Mastitis Research and Control Program

**T**WENTY years ago Dr. D. H. Udall, then head of the Department of Medicine at the New York State Veterinary College at Cornell University, tackled the problem of bovine mastitis. His approach to this very costly disease was through examination of the cow's udder and its secretions, combined with improved herd management and sanitation.

In those days, before modern antibiotics such as sulpha drugs and penicillin, treatments (if any were used) consisted mostly of counter-irritants applied to the outside of the udder along with massage or the application of heat or cold. These treatments were augmented with frequent milking of the cow, which seemed to have a good effect. Other steps used for the control of mastitis in those days included segregation and disposal of cows with badly damaged udders. The most important step, however, was an approach to mastitis control through improved herd management and sanitation.

Those original methods did much in reducing the incidence of mastitis in a great many herds, many of which still have no trouble from mastitis.

### A Good Example

One of the dairymen worked with in the early '30's was Charles Lewis of Rock Tavern in Orange County. His 36-cow herd was so severely infected with mastitis that he lost cows faster than he could raise heifers to replace those sold on account of mastitis.

Control measures were started following examination of his cattle, and in a couple of years the disease was under control so that instead of selling mastitis cows for beef, mature dairy cows were being sold to make room for the replacements raised.

Two years ago when the Lewis herd was examined by Dr. K. I. Gumaer, Mastitis Control field veterinarian of Farmingdale, he found only 1 cow in the herd showing presence of abnormal secretions. The Lewis herd now averages between 9 and 10 years old, and in November, 15-year-old "Gertie" produced 40 pounds a day in the third month of her lactation.

### Money for Research

Because farmers requested additional guidance in mastitis control, the State Legislature in 1946 appropriated about \$75,000 to inaugurate the New York State Mastitis Research and Control Program which is administered by the New York State Veterinary College at Cornell University. Somewhat larger sums to expand the program have been appropriated each year since. Today the New York program operates around five field laboratories in addition to the central laboratory at the Veterinary College.

More than 1,250 herds have been worked with since 1946. Much information has been collected to show the relationship between mastitis and herd management and sanitation.

The information gained from these records shows definitely that herd management is the important factor in bovine mastitis control. The results prove that Dr. Udall was on the right track back in the '30's when he emphasized that good sanitation, proper milking, segregation of diseased cows, and mastitis-free replacements were of first importance in mastitis control.

Often, overanxious salesmen give dairymen wrong impressions and a feeling of false security regarding both equipment used and mastitis treatments. Last summer I heard a milking

machine salesman tell a group of farmers that use of his machine prevented mastitis, and similar claims have appeared in print. Our records do not substantiate this. *We think that the man who uses the machine is the determining factor.*

If the dairyman keeps the rubber parts clean and in good repair, operates the machine according to the manufacturer's instructions, and follows better milking methods, any standard make machine will give satisfactory service.

### Cured Cows Not Immune

Now that modern drugs are so easily available, many dairymen are paying too little attention to preventative practices. They think treatments are the whole answer and forget the importance of prevention.

*We know that modern treatments, when properly selected and carefully used, give excellent results, but when we place all reliance on treatments the cost of them is often wasted if we ignore preventative measures.* The so-called cured cow is not immune. To attempt to obtain a recovery from treatment but to continue on with the practices that caused the trouble in the first place is downright folly.

A study of what happened in two groups of herds shows that *good management pays dividends in the control of mastitis.*

A comparison of the amount of mastitis in 24 herds practicing good herd management and 25 herds practicing poor herd management has been made over the past 3 years.

First examinations of the good herd group showed that 16.4% of the cows were producing abnormal milk, but when the last examination was made (anywhere from 6 months to 3 years after the first examination) only 4.8% of the cows were giving abnormal milk. This represented a reduction in abnormal secretions of 70% when good herd management was practiced.

In the poor herd management group, we found mastitis got worse instead of better. On first examination, 15.8%

of the cows were producing milk considered abnormal, but upon the last examination abnormal secretions were 19.2%, a 22% increase.

Two years ago we were called by the owner of a 70-cow herd in serious trouble with mastitis and in danger of losing his milk market. His herd received a careful and complete examination and diagnosis, followed by good treatment by his veterinarian, but sanitary methods and good milking methods were not practiced. The dairyman refused to be convinced that good herd management is important to mastitis control, and despite the good treatment, no satisfactory improvement was achieved. On the first examination, 43% of his cows produced abnormal milk, and the final examination still showed approximately 25%.

While this dairyman failed to get much benefit out of the state mastitis program, another herd was worked with very successfully. This herd owner received the same good diagnosis and good treatment, but also practiced good herd management. Here 17% of the cows produced abnormal milk at the start and none at the last examination.

In this second herd a very unsatisfactory job of milking was being done when we first saw it. This was quickly corrected and, following a careful diagnosis, about half the quarters in the herd were treated with satisfactory results.

These two examples demonstrate that it is not treatment alone that controls mastitis, but good preventative measures combined with treatment.

There are still many perplexing questions concerning mastitis, its cause, and what to do when it strikes, that need a better answer than we have. The present thinking of people working with mastitis is that there are many different kinds of bacteria associated with the disease. These get into the udder from many places such as unclean milking machines, hands of milkers, udder towels, floors, muddy barnyards and lanes. Injuries to teats and udders speed the entrance of bacteria into the udder. Maybe sometime in the future we shall have better answers to why mastitis occurs, but until that time comes any dairyman, if he will use the existing knowledge and theories, can reduce materially the incidence of the disease.

Services of the six field laboratories

(Continued on Opposite Page)

### COUNTERBALANCED GATE OPENS EASILY

A few saplings, an old 50 or 60 pound steel drum, a few feet of cable and a pair of hinges are all that Fred McMillan of Inlet Valley, Ithaca, N. Y., needs to build a gate like the one pictured above. Fred pays special attention to aligning the cross bars, and when he's finished even the youngest of the many visitors to the McMillan farm can open and close the gate with ease. (Staff photo.)

From left to right: Melvin Gilbert, East Homer, N. Y.; Charles Alexander who lives on the Cortland-McGraw Road, and Dick Ripley of Cortland, R.D. 1.

They were first, second, and third prize winners respectively in a plowing contest held in Cortland County, N. Y. last fall. They were scored for straightness and quality of the backfurrow, uniformity of depth, evenness of ends, the covering of trash as well as general appearance of the plowing and way of handling the tractor. —Photo courtesy of Post-Standard

## Winter Livestock Hints

### LAMBING PENS

Two wooden panels four to five feet long and three feet high, hinged together, make excellent lambing pens. They may also be used to make temporary pens for drenching, dipping, sorting lambs, and checking over the ewes. Directions for building these hinged panels and other sheep equipment may be found in U.S.D.A. Farmers Bulletin 810.

— A.A. —

### RICKETS

Rickets is a nutritional disease due to a lack of Vitamin D. Pigs that are kept indoors for a long period of time, not fed field-cured legume hay and that do not have access to direct sunlight may develop this disease. Common symptoms are lameness and stiffness.

Doses of cod-liver oil will usually correct the condition. A tablespoon is an adequate dose for an 80 pound pig. More should be given to larger hogs. Give this daily until the pigs appear normal.

Rickets can usually be prevented by letting the pigs have access to pasture or feeding field cured alfalfa and letting them have direct contact with the sunlight.

— A.A. —

### PRO AND CON

The question is sometimes asked as to the relative desirability of owning a herd sire or belonging to an Artificial Insemination Association. Probably the question never will be settled to the satisfaction of everyone, but it does seem that artificial insemination has excellent points for the man who does not consider himself a cattle breeder.

As one young dairyman put it, "certainly the men employed by the Association know more about buying bulls than I do." His confidence was not misplaced because already his herd average had improved.

On the other hand, it is entirely probable that men with purebred herds who have followed a breeding program for years may attain the results they want best by owning their own herd sire.

Perhaps a word of caution is in or-

der. Membership in an Artificial Breeding Association is not a cheap method of breeding cows. It is not intended to be, but rather it is a method of breeding better animals than the average dairyman is likely to breed by owning his own herd sire.

— A.A. —

### HELP FROM YOUR LOCKER MANAGER

Locker managers can relieve you of much or all the work at butchering time. These men have been a big help to farm families in handling the home meat supply. They can do the best job for you, however, if they know when to expect your meat. They appreciate your planning your butchering days in advance with them. If you can avoid butchering in their busiest season, they can give your job more personal attention.—George H. Wellington

— A.A. —

### ALFALFA FOR SWINE

All hogs in dry lot should have some good legume hay in the ration. Five to ten per cent ground alfalfa is satisfactory for all swine rations where pigs are not on pasture. In the case of bred sows and gilts the amount may be increased to 15 to 20 per cent. Some producers prefer to feed the hay in racks. Use the best of your alfalfa for the pigs.—M. D. Lacy.

— A.A. —

### MANAGEMENT AND SANITATION PAY OFF

(Continued from Opposite Page)

operated by the New York State Mastitis Research and Control Program are available to any New York State dairyman. Those who wish to know more about what these laboratories can do to help save cows through mastitis control can get this information from their own veterinarian, their county agent, or the field veterinarian located at each laboratory.

EDITOR'S NOTE: Other Northeast states, through the colleges of agriculture and departments of agriculture, are carrying on mastitis studies and, in most cases, offering laboratory service. Information is available through county agents and veterinarians.

The "Queen's Guard", with over forty years of honorable service, stands ready and able as always. There's nothing like BAG BALM for combatting Superficial Injuries to udders and teats; for Sunburn, Windburn; beneficial massage of Caked Bag. Lanolin-loaded, antiseptic-on-contact, BAG BALM spreads right, stays on. Be prepared for those ever-

occurring outbreaks. Get BAG BALM today at your favorite store. Insist on the original and genuine; imitations only, LOOK like BAG BALM.

## Vegetable and Potato Growers Hold Annual Sessions at Buffalo

ONE OF the handicaps of reporting what went on at the joint meeting of the Empire State Potato Club and the New York State Vegetable Growers' Association at Buffalo was the fact that part of the time two sessions were being held. By splitting assignments Skeff and I handled the situation, and I hereby express my appreciation for his help.

First, let's hear what some of the growers said and did.

Carl Emerling of Boston, in discussing cost control, made these points: 1. Let's market our potatoes over a long season—from late August to the

pect to get needed acreage.

Arthur Poelma, secretary of the State Canning Crop Growers, reported that 52 per cent of the growers last year signed agreements to let the Association do the selling. The program was not carried through because the necessary two-thirds did not sign. He expects that two-thirds will sign this year.

Ward West of Rochester was chairman of the discussion on virus diseases of greenhouse tomatoes. Recommendations are to plant no seed less than 6 months old and to kill weeds around hotbeds and greenhouses.

### Research:

Reporting on vegetable research at Cornell, Dr. H. C. Thompson made these comments:

When fertilizing vegetables heavily, best results come from a 1-1-1 ratio with the possible exception of light soils, where 1-1-2 is better.

At the left is Karl Hoffman, Springville, N. Y., with his first prize peck sack of potatoes. At the right is Harold (Red) Evans, president of the Empire New York State Potato Club.

middle of April. 2. Haul large loads when you go to market. 3. Handle potatoes and supplies as few times as possible. 4. Irrigate to help insure high yields. 5. Through good practices, eliminate poor grades during the growing process. 6. Handle potatoes carefully to avoid injury.

Bruce Cottrell of Homer said that 1950 costs compared to those in 1938 have more than doubled while profits were less than half. The only way he can see to cut costs per bushel is to increase the yield per acre and to grow a higher percentage of U. S. No. 1's.

Jonas Haseley of Sanborn declared that vegetable growers who are looking only at the dollar usually fail. It is important to serve consumers.

Karl Hoffman of Springville believes that potato growers must put up a pack that is better than U. S. No. 1. He backs up his statement with performance. A peck sack packed by him was judged the best of 38 sacks bought on the open market by State inspectors.

E. L. Kent & Sons of Andover took home the sweepstakes cup for the best potato exhibit of 15 tubers.

Tom LaMont of Albion made the following points about tomatoes for canning: 1. Too much emphasis has been put on quantity rather than quality. 2. Better varieties are needed. 3. Long rotations are good—tomatoes one year in three. 4. Prices must be higher in 1951 if processors ex-

Boron, where needed, must be used carefully on acid soils where 10 to 15 pounds of borax are recommended per acre instead of the 50 pounds of alkali on neutral soils. One or two pounds of molybdenum per acre has controlled whip-tail of cauliflower.

On greenhouse tomatoes, fertilizer added when the first cluster turns pink gives the biggest increase. Breeding will be continued to develop a blight-resistant celery. Two new varieties of cucumbers, New York State pickling and Niagara slicing, are resistant to mosaic. A new strain of Delicious melon is resistant to fusarium.

Some chemical weed controls can be used effectively as a pre-emergence spray on a number of vegetables. Vegetables, in consumer packages made of various transparent film are difficult to cool.

There are no new Empire State Po-

(Continued on Opposite Page)

Frank Miller of Blasdell, N. Y., one of the prize winners at the Vegetable Show. The parsnips next to his prize-winning celery were shown by William Pfeiffer of Gardenville, N. Y.

## Vegetable and Potato Growers Hold Annual Sessions at Buffalo

(Continued from Opposite Page)

tato Club officers elected. Vegetable Growers re-elected officers with exception of John Martin of Brockport elected to succeed Arthur Bradley of Elmira, as director and John Carew of Ithaca to succeed Paul Work of Ithaca.

### Resolutions:

Potato Growers expressed policies and wishes by the following resolutions:

Inasmuch as New York State growers get no price support for the 1950 crop, they object to purchase of out-of-state surplus potatoes by state institutions.

Urged county potato committees to study the action of Erie and Allegany county growers where pickouts were sold to dairymen for feed.

Favored uniform State highway laws on trucks.

Urged chain stores to avoid selling potatoes as loss-leaders.

Urged the Conference Board of Farm Organizations to work for a law requiring grade labeling of all potatoes offered for sale. (This was generally approved as being an important step in insuring good quality potatoes for consumers.)

Approved the idea of a Genesee Valley Market authority.

Vegetable growers also favored the Genesee Market authority.

Other resolutions urged that a high

priority be given to a new greenhouse at Cornell and favored a canning crops specialist at Cornell, also one on small fruits.

The foregoing report covers just a few highlights. The meeting was packed full of information for growers, both in the program and trade show.

E. L. Kent of Andover, N. Y., and tubers exhibited by him and his sons which won him the sweepstakes cup.

Attendance was good, especially on Thursday, but it was by no means as large as the quality of the program would warrant.—Hugh Cosline.

## Protecting Metal Roofs from Lightning Damage

**Z**INC-COATED metal roofs themselves protect buildings against lightning if a path is provided for the electrical discharges to enter the earth without passing through non-conducting combustible materials. As long as the lightning has a clear, easy and continuous path by which to enter the ground, it does little or no damage. The first problem, then, on metal roofs and buildings is to make sure that all parts of the metal are joined securely to form one large conductor.

To obtain maximum protection, the roof should be carefully re-nailed before the ground cables are attached. Loose nails should be replaced. Recommendations of the American Zinc Institute, based on work by the Agricultural Extension Service of Iowa State College, call for 1 1/4-inch to 2-inch galvanized screw-type nails, which should be driven through the original nail-holes in sheets but slanted so as to penetrate new wood. Nails should be spaced a maximum of 8 inches apart on the side laps and 5 inches apart on the ends. Use sheet metal screws (1/2 inch, No. 12) to fasten sheets together where nails won't hold.

Because most metal-roofed farm and industrial buildings are covered with overlapping sheets secured to each other by lead-headed nails or self-tapping screws, a continuous electrical contact of the whole roof is established when the roof has been checked and re-nailed. Therefore, lightning rods need be provided only on chimneys, ventilators or gables which project above the roof.

Galvanized (zinc-coated) rod or pipe extending at least one foot above, and solidly attached to, both roofing and projection is recommended. If a projecting structure is not subject to damage by lightning, it need not be specially protected if securely bonded to the roof. However, metal ventilating

flues should be grounded independently or connected to the system.

Unconnected sections of metal roof—a side shed or garage, for example—must be connected to the main roof to complete the grounding circuit, with at least 18 inches of cable in firm contact with each section.

—A.A.—

### DON'T BUILD A CESSPOOL

**D**ON'T ASK us how to build a cesspool, as we dislike to tell you how to put in something which in dangerous to the water supply and which is sure to prove troublesome after a few years. A cesspool is simply a cistern—like a hole walled up with loose brick or cement block, with the idea that the liquid part of the sewage will soak away into the soil. It does for a few seasons if the soil is coarse sand or open gravel or if it is of rock with open seams; but usually only for a few months where the soil is rather close. This is because the soap, grease, and other solids soak into the soil openings and soon clog them. The only remedy is to fill the old hole and dig a new one. The filthy and dangerous seepage from a cesspool may be carried 75 to 100 feet in a sandy soil and even for long distances where it escapes into rock crevices.

Building a cesspool usually costs more in the long run than a septic tank. Counting present labor costs and considering the larger size needed, the first cost is only slightly below that of a septic tank, and it must be done over again, whereas a good septic tank should last a lifetime with little or no upkeep. If you can put in only a part of a sewage system, use a septic tank so planned that you can connect the additional units as they are put in. This probably will call for a tee and plug where you now would need only an elbow.—I. W. Dickerson.

get bigger, better, more profitable yields

PLANT

## Hoffman FARM SEEDS

Get good ripe Corn  
plus  
these 5-star features

- ★ faster starting
- ★ super-standability
- ★ disease resistance
- ★ insect resistance
- ★ drought resistance

These are the features that put money in your pocket at harvest time.

Each of these features is bred into Funk G Hybrids.

Whatever your local soil and climate conditions, there are Funk G Hybrids (both for husking and for silage) bred especially to produce higher yields of better corn in your fields.

Find out which Funk G Hybrid is the right one—which one is "field-proved" for your area. Mail coupon today!

There are two ways you can help beat adverse growing conditions and still bring in a profitable crop.

The first and most important: buy *quality* seed. The second: follow proved farming methods that take the fullest advantage of your local growing conditions.

To help you get better crops and bigger harvests this year, we have prepared a special booklet that covers both points. It tells you all the latest facts about Buffalo and Ranger Alfalfas, Cumberland and Kenland Clovers, Clinton "11" Oats, Birdsfoot Trefoil and other new popular seeds.

This booklet also gives you valuable tips about fertilizing, stock feeding, weed control, grass silage, etc.—information that will help you save time and trouble—make your farming efforts more profitable. Send for this booklet. It's yours *free*! Mail coupon below.

Yorkstate Pickling Cucumber

## HARRIS SEEDS

We were certainly discouraged 'til the doctor came.

It was discouraging, trying to grow cucumbers when the disease called "mosaic" dried up the vines just as they came into bearing. But Plant Doctor Munger of Cornell University came up with a remedy—a mosaic-resistant variety, Yorkstate Pickling, which is not killed by the disease. The vines are large and vigorous, producing heavily over a long period even in areas where mosaic has been serious. The fruits are good size and shape for pickles. Just another example of our desire to bring you vegetables that are tailor-made for the adverse conditions under which they must be grown.

# NEW Pastures for OLD

From "A Story In Pictures" by  
Malcolm H. McVickar in the  
*Fertilizer Review*

(Photos: W. J. Mead and Northern Virginia Pasture Station.)

Wornout pastures like that shown at the right are not profitable but USDA research workers at Beltsville report that if renovation is carried out about every 5 years, it will pay off handsomely with pastures like that shown above. Pictures 1, 2, 3, 4 show steps to take.

**2.** To get productive grasses and legumes of top quality, plenty of plant food must be used. The fertilizer should be applied after the old sod is torn up so that it can be worked into the seed bed.

**4.** The close-up at the right of a splendid grass-legume pasture, often called Nature's most perfect livestock feed, gives you an idea of the kind of job that can be done by renovating old wornout pastures. In this case the farmer's careful attention to all of the proper procedures has paid off.

This farmer ripped up the old sod in such a way that he got a good kill of the old vegetation and left the trash on top; he used adequate amounts of fertilizer; bought the best seed, making sure of variety as well as seed purity; and then applied it to a good firm seedbed. The result gave him the kind of pasture which, coupled with good livestock, makes an unbeatable team as far as farmer profits are concerned.

**1.** Rip up the old sod with a deep tiller, disk harrow or rotary tiller to leave trash on surface to reduce erosion losses and serve as mulch. Whatever the equipment, be sure to kill most old vegetation.

**3.** There is no substitute for quality seed but, regardless of the quality or kind of seed chosen, the renovation will not be a real success unless a good firm and compact seed bed is established. The seed bed is vital.

# Now They're "Atomizing" Spray and Dust

**Y**OU can do almost anything with the latest equipment available for dusting and spraying. Manufacturers are now producing machines that will use either dry or wettable dust; will "atomize" spray material so well that one gallon of concentrated mixture will now do the work of 8 gallons of diluted mixture; and making the machines so efficient that savings of 50% in time and 25% in materials are not uncommon. Relatively simple nozzle or diffuser changes also fit these new machines for row crop, vineyard and weed-killing work and for livestock disinfecting. This newest type equipment, called various names by the manufacturers, such as "Iron Age Mist Sprayer" by Farquhar, "Turbulent Air Sprayer-Duster" by Buffalo Turbine, and "Sprayer-Atomizer" by Pasteur, has followed on the heels of the development of concentrated insecticides so that many farmers today are using light weight, combination equipment which will handle all of the average farm's spraying and dusting work whether it's spraying tall apple trees, row crops or dairy cows.

K. R. Popham, general manager of

the Buffalo Turbine Company, says their sprayer-duster can distribute insecticides and fungicides in the form of liquid or dust, or a combination of both in any proportion. The use of combination dust and "liquid sticker" is successful due to the use of a blast of air that can be varied from a gentle breeze to a 150 mile-per-hour hurricane. The blast is created by Buffalo Turbine's new type axial-flow blower. The unit consists of blower, liquid or air-cooled engine, 50 gallon tank and a 150-pound dust bin, all mounted on a heavy frame. It can be mounted "as is" on a light pick-up truck or bought on a 360-degree turntable for use on a flat-bed truck. They also make a regular two-wheel trailer model and another that can be mounted on a jeep with rear power take-off. List prices for various models, f.o.b. Gowanda, N. Y. range from \$1,200 to \$2,000. The Buffalo Turbine has been on the market five years.

## Atomizer From France

The Pasteur "Sprayer-Atomizer," made in France, has been in use for four years all over France, in many other Western European countries, and in several countries in Africa. It was introduced in the United States last summer at Chicago's International Trade Fair and has since been demonstrated throughout New York and the New England states and as far south as Virginia. Imported by Nomaco, Incorporated, of New York, the machines are being distributed in the Northeast by Hub Motor Sales of Cortland.

The French machine, which is available with either 105 or 210 gallon tanks, also features versatility, being able to apply dry dusts, liquids, liquid solutions, wettable dusts, emulsions or suspensions in either the concentrated or diluted forms. It is designed so the operator can switch from the application of dusts to the application of liquids, or to the simultaneous application of both, merely by moving a lever on the control board.

The machine, which is trailer-mounted, consists of a centrifugal pump turned by a V-belt, a centrifugal fan coupled directly to a 6 hp motor, one tank and one dust bin. It has no pistons, sleeves, gears, agitators or pressure regulators. About 100 of these machines may be imported per month. The 105-gallon model is priced \$1,668 f.o.b. New York or Philadelphia, but this not include the cost of diffusers, which range from \$110 for the small tree or row crop models up to \$312 for a high-vegetation row crop diffuser.

## Hand-Sprayer

For those with only a few fruit trees or relatively small areas of row crops, and for use in greenhouses, poultry houses and barns, the Campbell-Hausfeld Co., Harrison, Ohio, makes Paragon sprayers in both hand and power models. Hand models are from 5 to 50 gallon capacity, and power units from 20 to 55 gallons. One model is complete with equipment for tractor mounting.

The sprayers of 12-gallon and larger sizes are equipped with one- or two-wheel trucks with steel or rubber tires. All models handle any solution that does not gum and that remains in thin solution during application. The Paragon, which is built so that the pump is never submerged in solution, has an automatic strainer-cleaner agitator. It's adapted to whitewashing or shingle staining and many other uses, as well as to distributing insecticides and disinfectants.

Hand-operated models run from \$19.95 up to \$97.95 for the 55-gallon size. The power model with a 20 gallon tank and pneumatic tires is \$245 f.o.b. Harrison, Ohio.—A.J.H.

# Producing Hatching Eggs for the BROILER INDUSTRY

By L. E. Weaver

AS the broiler industry becomes bigger and bigger, broiler growers seem to become more and more particular about the sort of chicks they will buy. The chicks must grow very fast, because that means growth at low cost. They must grow a complete covering of feathers

L. E. Weaver

quickly. They must all be healthy and vigorous. Losses must be very, very few even when thousands are brooded together. Most important of all, they must grow into blocky, meaty, yellow - skinned broilers weighing about three and a half pounds at twelve weeks, counting all the flock; not just the biggest ones or with a lot of smaller ones sorted out. In addition to all these requirements, the demand has been getting stronger all the time for light-colored feathers, or at least the quills of the feathers must not carry the dark pigment that often mars the appearance of dressed broilers.

No one can find fault with the broiler grower for wanting such chicks. We all know, as he knows, that starting with such chicks goes a long way toward insuring him against losses and improving his chances for a profit. However, the best broiler chicks in the world will not guarantee a profit. I suppose nothing can ever remove all risk.

## Costs Need Study

The point I want to make now is that there is another side to this situation, the side of the poultry flock owners who produce the hatching eggs from which the best broiler chicks are hatched. They have not been doing so well of late. In spite of what seem like liberal premiums above top New York City quotations, and practically a year-around market for their eggs, a number of flock owners in my central New York region have lost a lot of money in the past year and have quit the hatching egg business. Some have had to quit the poultry business entirely. If that situation is the same in other sections, it looks as though our booming broiler industry may be in for a scarcity of the right sort of chicks. I am wondering if a "rethinking of policy," as they say in Congress, might not avert this difficulty and keep things running until a more fundamental solution, namely better crosses through extensive breeding and testing, is worked out.

Here is what I have in mind. Let's start with the summer of 1948, three years ago, when I visited a number of poultry breeding farms in New Hampshire, Massachusetts and Connecticut. I was told, and on checking found gen-

eral agreement, that in New England there were three types of New Hampshire chickens.

One is the meat type, vigorous, rapid growing, rapid feathering and tops for attractive dressed appearance; but not so good as egg layers. At the other extreme are the New Hampshires that can just about hold their own in egg production with the high-egg-producing Massachusetts Reds; but not very desirable for broilers. Then there are the in-betweens, not very numerous, I judged, just so-so for layers and just so-so for meat.

## Want Higher Premium

Talking with one of the meat-type Hampshire men I said, "Since one New Hampshire hen is the same as any other New Hampshire to most people, how can you expect flock owners to use your strain when they can have more hatching eggs to sell from other strains?" "That's easy," said he. "All we have to do is to see that he gets a correspondingly higher premium for the fewer but better eggs he does produce. The eggs from our stock are certainly worth more than our competitors' eggs to the broiler grower." That is the temporary solution that I think will have to be made, a larger premium for hatching eggs from the strains with superior meat quality but lower egg production.

Five years ago, Howard Pierce, the forward-looking top poultry and egg man for Atlantic & Pacific Tea Company was instrumental in launching the Chicken-of-Tomorrow contest, which is a genuine grass-roots approach to the problem. The contest encourages breeders to improve existing strains, or create new varieties if necessary, that will combine superior meat quality with reasonably high egg production, and will also possess high adult livability. Out of one three-year completed contest, and another in its third year, has come a vast awareness of the need for better meat stock and of the possibilities that lie in cross-breeding as well as improvements in pure breeds. To me, it looks just now as though there will be a number of Chickens-of-Tomorrow when all the records are complete on all the broad-breasted, rapid-growing, rapid-feathering, light-plumaged varieties and crosses now in the making.

## Some of the Problems

If you could just quit selling your eggs to a market buyer, and let a

hatchery have them at a 15 to 30 cent higher price per dozen, there would be no problem. Unfortunately, it is not such a simple matter as all that. It is actually a rather complicated matter which involves a reduction in number of layers, reduction in eggs per layer, increase in cost of feed per layer, in addition to costs for blood testing, for males reared or purchased and for their board bill. On top of all that you will probably find that about a quarter of your eggs are unsuitable for incubation and even as market eggs must be sold at a reduced price. Membership in the National Poultry Improvement Plan will add another small charge.

I have been unable to find any report of the cost of producing hatching eggs based on actual cost accounts. I wish such a study could be made and soon. As for estimates, the most complete and recent one I have seen was made by Prof. H. E. Botsford of Cornell. He comes out with 23 cents as the extra cost of producing a dozen of hatching eggs as contrasted with market eggs. That figure, however, can only be used as a sort of weathervane. It does show which way the wind is blowing. It doesn't tell the whole story.

Botsford says, "The time of year will affect the price on which premiums are based. If one is producing hatching eggs the year around, he is obviously better off than another who points for a high production of hatching eggs in the spring, and produces only market eggs at other seasons. A short season raises the cost per dozen. Also a high percentage of eggs that are unsuitable for hatching increases the cost per dozen." Botsford's estimate is based on a six-months' period, with 24 eggs per hen unsuitable for hatching out of a total of 100 laid and using Leghorns only.

## Better Livability

This estimate omits entirely any consideration of what I think is the chief difficulty for the flock owner who changes over from Leghorns to one of the broiler strains, namely a big reduction in number of eggs he can offer for sale. In the first place, he can't keep so many layers. Botsford mentions a poultry man who found that his 1,200 Leghorn house would accommodate only 900 heavies, and of those at least 60 would have to be males. In the second place, with a meat strain the flock owner would have to expect at least three dozen less eggs per hen per year.

How well the breeding hens and males live is another big factor in keeping down the costs. Botsford doesn't figure any difference in his estimate, but he says, "Many flock owners agree that there is an additional 5 per cent mortality among females in a mated pen." Ten years ago Leghorns didn't live as well as heavies, as shown

(Continued on Opposite Page)

It's all in the family at Chamberlin Poultry Farms, West Brattleboro, Vt., where three brothers attend to layers, incubators and pullet range while their sister handles the grading room work. From a general farm with a few layers 25 years ago, it has grown into a specialty revolving around 6,500 layers. Heavy culling and introduction of new blood from other Barred Rock strains have kept the flock at top vitality. Photo shows the three brothers in a cheerful huddle with sister Agnes Chamberlin. Left to right, they are Thomas, Merritt and Henry Chamberlin.

# Saving Hours in the Fruit Orchard

(Continued from Page 8)

vated the year before. The hours we spent getting stuck and un-stuck in this orchard were a caution. One thing that is worrying us this year is that the lateness of the Fall and the difficulty in getting the peach leaves off left our peach orchard unsprayed and full of leaf curl. I hate to think of getting through the cultivated peach orchards this spring with heavy equipment.

The other reason why my neighbor has planted more orchard is that he has some modern air-blast spray equipment. These new sprayers are certainly saving thousands of hours where growers have sizable operations. The total hours are not the whole story. They are much easier to operate for the worker who is running them. It takes a little more attention and there is less opportunity to sleep while the horses drive the empty rig back to the water tank. But at the end of the day the operator usually finds himself not as bone tired as he would be holding a spray gun or pulling a spray hose over the ground.

The report of the joint surveys taken by the New York State College of Agriculture indicates that man hours saved more than make up for the capital investment with a reasonable depreciation. The new advances in the past two years in concentrating sprays have done a great deal to cut down the number of hours in spraying and the number of skilled men necessary on a modern fruit farm. Now tanks have to be filled only one-quarter as many times; only one-quarter to one-eighth as much water has to be carried around.

## Savings Count Up

Thousands and thousands of hours have been saved in spraying by proper location and utilization of water and spray materials, ponds and dammed up ditches. Pipe lines and overhead tanks

with 3-inch outlets have reduced the time of filling from 20 minutes to 3 and 4 minutes. Trucking the water and materials to the high capacity rig uses one more man but still saves hours for the machine.

Platforms which are level with the opening into the spray tank of the rig save a lot of steps up and down and speed up the filling. Large capacity pumps which fill the tank from nearby water holes are a big saving and do not cost much more than the smaller sized pumps. One little gadget we rigged up was a wire which led from the spark plug of the gas-driven pump to the overhead supply tank. When the supply tank gets full and touches the uninsulated tip of the wire which hangs down from above, the engine is grounded and the tank does not run over. We used to have someone stand around to stop the pump.

The right size bags of spray materials could save time and refilling if growers could standardize on a certain size tank. Some dangerous new insecticides are less dangerous when handled directly out of the bag into the tank.

Growers unable to purchase air-blast type equipment, but who have very satisfactory high pressure equipment at the present time, may be able to modify their equipment with a new air blaster which they can hook on behind their present rig. The high pressure pump can be hitched directly to the outlets on the air blast which has itself no power system. If their machines are practical, it is within the range of possibility that all growers will be able to use concentrate equipment, if the orchards are of the right size and open.

All right folks, let's start shooting at ways to save time. None of us have too much of it. If I don't get shot in the meantime, I may have something to say later about saving time in harvesting.

## SEW AND SAVE!

JUST off the press, our FASHION BOOK for Spring and Summer, beautifully illustrated, brings you the newest in fashion and presents it in practical pattern designs, easy to make, delightful to wear. Featuring:

The new wrapped silhouette Basic dress with change-about fashion details  
Gay Easter fashions  
Important year-round separates  
Collection of lovely blouses  
Trousseau needs  
Young date and party clothes  
Special article on necklines and hair-do's for your type  
Designs for sheers (rayon or cotton)  
Dresses with set-in sleeves for the mature figure  
Cap-sleeved cottons a-plenty  
Sunbaths and boleros for all occasions  
Vacation togs, for casual wear and active sports  
Home frocks, aprons  
Girls' and children's pretty frocks and play clothes

A wonderful book with over 135 pattern designs for all ages and occasions to help you plan complete wardrobes for Spring and Summer. Price just 20 cents. To get a copy, send 20 cents in coins to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## KEEPING EGGS CLEAN

DIRTY eggs in too large numbers is the No. 1 problem, say marketing officials in Massachusetts. Some of the dirty eggs are laid on range in rainy weather. This cannot be prevented until birds are housed. In the laying pens here are some of the improvements which will give more clean eggs:

1. Allow 3½ to 4 square feet of floor space to the bird. Overcrowding means wet floor litter.
2. Add hydrated lime at the rate of one pound to each bird. This can be scattered in two or three applications.
3. Feed grain in the litter and encourage scratching. Stir the litter before it packs.
4. Use a drinking fountain that prevents water throwing. A shallow water level gives less throwing.
5. Replace litter in nests as often as necessary. If floor litter is damp, use lime boxes in front of the nest entrance. "Chick-bed" is a good nest litter for damp houses.
6. Gather eggs three or four times a day when litter is wet.
7. If dirty eggs are to be washed, do the job as soon as they are graded.

—G. T. Klein.

—A. A.—

## HATCHING EGGS

(Continued from Opposite Page)

by laying test records and surveys. That is no longer true. Last year at the Western New York test, 88.5 Leghorns were still living at the end of the year for every 100 that were entered. Total Leghorn entry was 390. For Rhode Island Reds and New Hampshires the livability figures were 89.0 and 89.7 respectively. At the Storrs contest the livability figures were, for Rhode Island Reds, 88.2; for New Hampshires, 84.6, and for Leghorns, 84.3.

## Hendershore Farms DISPERSAL

135 REGISTERED GUERNSEY CATTLE  
MONDAY, JANUARY 29

The Dr. R. S. Bickley Herd of Henderson, Jefferson Co., N. Y. will be sold in large heated sale pavilion, EARLVILLE, MADISON CO., N. Y., which is located on Route 12-B, 5 miles south of Route 20 and 50 miles northeast of Binghamton, 120 miles southeast of Rochester, N. Y.

Herd T. B. Accredited, blood tested, majority calfhood vaccinated, carefully treated against shipping fever. This herd predominates in the famous McDonald Farms blood lines—4 daughters of McDonald Farms bred sires including:

65 granddaughters and great granddaughters of FOREMOST PREDICTION; 20 granddaughters of DOUGLSTON BARON BYRON; 80 Cows, all good ages, many fresh and close springers; 18 Yearlings, some ready to breed; 16 Heifer calves, majority several months old; 16 two-year-olds, bred or ready to breed; 5 Service Age Bulls, including 4 high record herd sires with their many daughters and a large number bred to them.

The entire herd is in beautiful condition, exceptionally good size, free from blemishes.

It's a herd of real good producers that have been ably handled and cared for without forcing, free from udder trouble, and highly desirable in every respect.

THIS IS THE KIND YOU WILL BUY. WELL WORTH THE MONEY AND RAPIDLY ENHANCE IN VALUE FOR YOU.

Sale starts 11 A.M. Hot dinner served. Catalogs upon request or at the ringside. Well-known Guernsey authorities will be on hand to assist sale days.

## DOWN THE

By J. F. (Doc) ROBERTS

The most indispensable farmer in 1950—THE FARMER'S WIFE.

The greatest farm accomplishment—BOUNTIFUL FOOD FOR ALL.

The best bowl game—A BOWL OF HOT OATMEAL AND CREAM ON A ZERO MORNING.

The surest farm possibility — FOOD SHORTAGES BEFORE 1951 IS OVER.

The farmer of distinction — THE JOINER AND WORKER IN FARM ORGANIZATIONS.

The farm wife's greatest contribution—4-H AND F.F.A. BOYS AND GIRLS.

The greatest farm worry — WILL OUR BOYS HAVE TO GO?

The most foolish farm program — THE BRANNAN PLAN.

The smartest farm legislator — BRANNAN, WHEN HE CAME OUT AGAINST LIVESTOCK CONTROLS.

The most important farm ingredient — MANURE.

The hardest working and most indispensable animal—THE COW.

The most needed animal—SHEEP.

The only independent farmer—THE CAT.

The luckiest farm animal — THE BULL.

The farmer's best friend—HIS GOOD NEIGHBOR.

The greatest farm disappointment—PUTTING RIPE HAY IN A GRASS SILO.

The best farm publication—YOU'RE READING IT!

The most farm progress — MORE LIVESTOCK, MORE CORN ON NORTHEAST FARMS.

The greatest farm opportunity — MORE AND BETTER GRASS AND STILL MORE LIVESTOCK.

The best individual farmer — THE POTATO GROWER VOTING AGAINST SUBSIDIES.

The luckiest farmer — THE ONE WHO CAN PAY HIS TAXES.

The farmer's greatest need—TO BE LEFT ALONE BY POLITICIANS.

The farmer's greatest asset — EXPERIENCE — NOT A ROCKING CHAIR.

The greatest farm dread for 1951—WAR AND BLACK MARKETS.

The farmer's greatest protection — HIS LONG UNDERWEAR.

The farmer's greatest ally and foe—THE WEATHER.

The most disillusioned farmer—THE ONE WHO THOUGHT THE GOVERNMENT WAS SANTA CLAUS.

The farmer's greatest pride — HIS FAMILY.

The strength of every farm family—FAITH.

The wish of every farmer for 1951—PEACE ON EARTH, GOOD WILL TOWARD MEN.

## NEW YORK ANNUAL MEETING

At the recent annual meeting of the New York Brown Swiss Breeders Association the program for the coming year was proposed and adopted as follows:

A membership drive to increase the paid membership; Canton meetings during the week of March 9th to 14th as follows: March 10, Central Canton; March 11, Western Canton; March 12, Northern Canton; March 13, Eastern Canton; (The Canton Shows will be held during the week of June 10 to 16); increase the Junior program; hold the spring sale in April; support the Eastern Breeders Production Sale and the State Show of Brown Swiss at New York State Fair.

Officers elected for the coming year were: President, Frank L. Jewett; Vice-Presidents—all of the four Canton Presidents: Eastern Canton, Harold Brigg; Northern Canton, Stewart Benedict; Central Canton, Albert Gahwiler, Jr.; Western Canton, W. B. Stewart; Sec.-Treas., J. Sandford Cross.

Frank Jewett, J. Sandford Cross, and John Harris were elected to the New York Purebred Dairy Cattle Association, representing the New York Brown Swiss Breeders Association.

Peter Klatzback, Jr. was appointed chairman of the Spring Sale to be held in April, with the other committee members to be selected by the Chairman.

Frank Jewett was appointed to represent the New York Association as member of the Eastern Breeders Production Sale Committee. This sale is held jointly by New York, New England and New Jersey.

Fred Gauntt, Eastern Fieldman, attended and spoke on the growth of the breed throughout the country and in New York state.

— A. A. —

## FARM CREDIT NEWS

H. B. Munger, president of the Farm Credit Administration of Springfield, has announced the reappointment of J. Ralph Graham of Boscawen, N. H., and the re-election of Marcus L. Urann of Hanson, Mass., to the seven-man board of the First Farm Credit District.

The new terms of Directors Graham and Urann are for three years beginning January 1, 1951. They will serve with the other five members of the Farm Credit Board of Springfield: Jacob A. Blakeslee, Newton, N. J.; Leon A. Chapin, North Bangor, N. Y.; J. Carlton Corwith, Water Mill, N. Y.; Warren W. Hawley, Jr., Batavia, N. Y.; and Julian B. Thayer, Rockfall, Conn. As members of the Farm Credit Board, these men serve as directors of the Federal Land Bank, Federal Intermediate Credit Bank, Production Credit Corporation, and the Springfield Bank for Cooperatives, all cooperative farm credit agencies which together offer a complete farm credit service to Northeast farmers.

## 4-A WINNER

Lynford Gregory operates a farm near Cattaraugus, New York. Lynford, who won the American Agriculturist Achievement Award as a Future Farmer in 1935, has a nice herd of Jerseys and delivers milk in the nearby village of Cattaraugus.

# All For Eleven Dollars!

**T**HE gay cheerful bedroom shown here was a dingy-looking spot just a few weeks ago. The windows were curtained with worn, dull, faded cretonne that had long since worn out its decorative usefulness. The bed flaunted a run-of-the-mill spread, and its openwork headboard was not attractive.

Venetian blinds did a grand job of regulating light and sunshine, of which the room gets a maximum amount, but the wooden casings between the double and triple windows looked barren. And the Conrads didn't want to clutter the windowed arca with curtains. When the blinds are open, the double windows look out over a field; the triple ones over the backyard with tall trees, flowers and a fruit-bearing grape-arbor. Too much curtain would shut these views out, so curtains were eliminated from the redecorating plans, and wide valances and the between-window decoration used instead.

Since the furniture in the room was well made and of an attractive dull-finished walnut, the main problem in revamping the room was to bring life and gaiety there, and give the windows an interesting, simple treatment. The homemaker herself took over that job and did it all with sewing-machine, needle, thread, sharp scissors and glue pot . . . all at the low cost of \$10.47!

The spread, shams, and valances are made from off-white cotton twill; the decorations on these were cut from the cheeriest rose-patterned cretonne that Margaret Conrad could find, then appli-qued onto the twill. The larger chair was upholstered in off-white monks' cloth, and the desk chair and low bench were given cushions of the same durable material.

The dust ruffle on the spread, and the narrow ones on the valances, chair pads and shams are of green percale . . . and that's what the green leaves that now decorate the upright window casings are, too! It took time to cut the leaves from the fabric, but like all

true homemakers, Margaret enjoyed doing it while listening to evening radio programs. Once done, they were held firmly in place with glue.

As a finish to the spread, leaves of the same shade of green as the dust ruffle were embroidered on the twill and done in a panel-effect. Then a few were embroidered near the head and foot of the bed to relieve the plainness there. Two sprays adorn the bench pad, also, and the lamp shade was covered with left-over scraps.

The expense was slight for the effect achieved. Here are the costs for the various items:

4 yards cotton twill (bedspread, valances, shams) at 59 cents per yard, \$2.36.

3½ yards cretonne (applique) at 79 cents per yard, \$2.77.

7 yards green percale (ruffles, leaves) at 39 cents per yard, \$2.73.

2½ yards monks' cloth, at 69 cents per yard, \$1.73.

2 skeins cotton yarn to embroider

leaves, 58 cents; other supplies, 30 cents; total cost of all items, \$10.47.

You would hardly recognize the room as the same one it was a short time ago. The windows have "opened up" and have a simple, effective treatment. With the pillows on the bed upright

By  
LOUISE PRICE BELL

You would never recognize this bedroom as the same one it was before its owner used her skill and ingenuity to give it its present cheery and colorful aspect. And the cost was even less than eleven dollars—to be exact, just \$10.47!

and covered with the attractive shams, the homely openwork headboard is no longer visible. And the cost of the entire redecorating job was so low that it should offer real inspiration to other homemakers with a yen to revamp some room.

**D**ID this ever happen to you? When you were working at some task, or going on a business errand, did something entirely unexpected and delightful occur? It can, if you keep your eyes and ears alert.

Suppose, for example, you're hanging out the wash and a chickadee alights on the other end of the clothesline, cocks his eye, and sings his cheerful "chick-a-dee-dee-dec." That once happened to me, and my heart was uplifted in tune with his song, so that the rest of the washing and hanging-out seemed easier. What I enjoyed then was "serendipity." It's often to be found in the day's work if you look for it.

That long word was pulled from oblivion by the famous author, Christopher Morley. He says it was invented by Horace Walpole, the 18th century essayist, to express that extra enjoyment, the "velvet" that can be picked up as you go along about your daily business. The origin of the word is from the Kingdom of Serendip, the old word for the Island of Ceylon. Once upon a time, according to an ancient tale, three princes of Serendip went off on tours of business around their kingdom, and on their return each related his adventures. They were amazed to find that while looking for one thing,

they made many other delightful and unexpected discoveries and had curious adventures they wouldn't have missed.

A friend of mine had this serendipity not long ago. She pushed her cart of groceries in line at the supermarket and was awaiting her turn at the cashier's desk, when a small trusting

hand was placed in hers and a plaintive voice said, "Where's my Mommie?" She left the line, saying, "We'll find her!", and together they went hunting through the aisles. Suddenly, the hand was jerked away, the tearful face was flooded with relief.

"There she is!" the child cried, rushing toward a woman who was taking

a can off the shelf. "And," added my friend, "I discovered that the mother was an old friend who had just come back to our town to live. She had not known I was here!" Well, there's serendipity for you!

Another friend, who is an avid gardener, very reluctantly agreed to help get out the school vote. It meant she had to call on people she didn't know and persuade them to use their voting power. Sometimes she was not too graciously received. But at one house, the woman who answered her ring was smiling and friendly as she asked my friend to come in. From the window, her backyard could be seen aglow with flowers. After the business was over, the hostess took my friend outdoors for a closer look. Her garden was beautifully cared for, and each plant was rightly placed with a perfect regard for a happy combination of colors. My friend and the stranger have become

the best of friends from that casual contact. That was rich serendipity which she would never have discovered unless she had accepted that tiresome job!

Plenty of serendipity came to me recently when I tried water color painting. I thought it would be fun, and it is. But oh, the other discoveries are far better than I dreamed! I am now aware of color and form, light and shadow, so that I enjoy all landscape as never before. I see it all with new eyes. The whole world of art lies before me, and I know what to look for in a picture now. This new language of painting links me with every country in the world and every period in history. More than that, I have gained a new circle of friends. The serendipity has outrun the fun I have with brush and paint.

Do you see how it works? Of course, some people never look for serendipity, and keep their eyes glued to only the business at hand. What they miss! It's a good idea when casting up the day's accounts to think of what unexpected happiness and knowledge have come your way. You can place these on the credit side of the ledger, and you'll go to bed with a satisfied feeling of achievement. And you can always look forward to tomorrow, for who knows what serendipity may be waiting round the corner for you!

## It's There If You Look For It!

By  
MARY GEISLER PHILLIPS

Thousands rave about the newest no-rinse washing marvel!

Read what  
some of them  
found out ...

**cheer!**

For snowy-white washes in far  
less time **WITHOUT RINSING!**

"The hours I save with my no-rinse  
washes with CHEER make life easier.  
The clothes were clean and WHITE the  
first run through the washer!" says  
Mrs. Alice Hayes of Syracuse, N. Y.

**cheer!**

Clothes dry soft and sweet  
**WITHOUT RINSING!**

"I haven't rinsed since the day I dis-  
covered how soft and fluffy and really  
sweet-smelling I could get my clothes  
with CHEER!" writes Mrs. Ruth John-  
son of N. Kansas City, Mo.

**cheer!**

Clothes iron beautifully  
**WITHOUT RINSING!**

"My CHEER-washes iron so smoothly  
and look so lovely. I'll never rinse  
again!" says Mrs. Rita Fecht of Clay,  
N. Y.

**WE CHALLENGE EVERY WOMAN  
TO TRY NO-RINSE WASHING NOW!**

Procter & Gamble's NEW! PATENTED!

"I'm glad I tried this New Dry Yeast because it's so much faster and easier"

## Homer Farm Wife Wins 21 Prizes At State Fair Cooking Competitions

Counting Mom's ribbons is a favorite indoor sport with David and Richard Smith—and their mother, Mrs. Chester Smith has plenty of ribbons to count. Twenty-one prizes in all went to Mrs. Chester Smith for her culinary skill at the 1950 New York State Fair!

A Fleischmann's Yeast user for many years, Mrs. Smith says, "I'm mighty glad I tried Fleischmann's New Improved Active Dry Yeast. It's so much

faster and easier than any other."

When you bake at home—use yeast. The delicious goodness and wholesome nourishment of yeast-raised treats make them a top family favorite. And when you use yeast—use the best—Fleischmann's New Improved Active Dry Yeast. It's easier to use, faster working. When you bake at home—treat your family to delicious, nutritious yeast-raised goodies.

## Save \$2.00 On This Home Mixed Cough Syrup

Easily Mixed. Needs No Cooking.

Cough medicines usually contain a large quantity of plain syrup—a good ingredient, but one which you can easily make at home. Mix 2 cups of granulated sugar with 1 cup of water. No cooking! Or you can use corn syrup or liquid honey, instead of sugar syrup.

Then get from your druggist 2½ ounces of Pinex, pour it into a pint bottle, and fill up with your syrup. This gives you a full pint of wonderful medicine for coughs due to colds. It makes a real saving because it gives you about four times as much for your money. Never spoils, and children love it.

This is actually a surprisingly effective, quick-acting cough medicine. Swiftly, you feel it taking hold. It loosens phlegm, soothes irritated membranes, makes breathing easy.

Pinex is a special compound of proven ingredients, in concentrated form, a most reliable, soothing agent for throat and bronchial irritations. Money refunded if it doesn't please you in every way.

FOR EXTRA CONVENIENCE GET NEW  
READY-MIXED, READY-TO-USE PINEX!

## Our New Cookbook

SINCE we announced our new AMERICAN AGRICULTURIST cookbook in the Dec. 16 issue, orders for it have poured in and we are filling them as fast as possible. If you missed the first announcement, here are the details:

Our cookbook is called THE AMERICAN AGRICULTURIST TREASURY OF COUNTRY COOKERY. It contains a collection of the best and most popular recipes published in our paper during the past 25 years. The price of the book is \$1.95, postpaid. In it you'll find A.A. recipes for everything from hearty soups and chowders to delicious desserts and preserves. Do you remember those chocolate chip brownies, the maple sponge cake, butterscotch brownies, orange puff, the wonderful apple pie recipe that was printed in our AT OUR HOUSE column, and the watermelon pickles and those Grange baking contest recipes? All these and many other treasured recipes are in the book.

Chapters include main dishes (poultry, game, meat, fish, eggs, with many excellent casserole dishes); vegetables, salads, bread and rolls, puddings, ice creams, fruit desserts, custards, pies, cakes, brownies, cookies; jams and jellies; pickles and relishes, maple treats, cheese dishes, beverages, herbs, ready-mixes, sandwiches, and a handy, up-to-date canning guide for meats, fruits and vegetables. The book has a spiral binding, and opens flat when in use—no danger of losing your place when you're in the middle of a recipe.

TO ORDER, send \$1.95 to AMERICAN AGRICULTURIST, Box, 367-CB, Ithaca, N. Y. The book will be sent postpaid to you or to any person you designate.

Valentine cookies, heart shaped and jelly filled, plus a cup of delicious hot chocolate topped with whipped cream makes satisfying and easy Valentine party refreshments.

# Valentine Day Party

By MABEL HEBEL

**P**LANNING a party for St. Valentine's Day? Then you'll want games and refreshments with plenty of heart interest. Those given here are suitable either for a party at home or for a community gathering.

### CUPID'S DARTS

Make a large heart out of white paper and attach to a soft board. Dot numbers all over the heart with "14" (St. Valentine's Day) in the center. Provide each player with an arrow of red construction paper and a thumb tack. Blindfold the player; he is to attempt to pin his arrow on the winning number—14—which counts the most. If no one actually touches 14, the numbers nearest it—13, 12, 15, 16, etc., would then be the winner. If there are prizes they would then be awarded according to the ones nearest 14, regardless of what they are. There is no order in which these numbers are sprinkled over the heart. Candy motto hearts or lollipop hearts are suitable awards for some of these games.

### MATCHING SWEETHEARTS

Divide the group into two sides, the side which first calls out the answer scoring a point. The leader calls out the name of a profession. The answer is a girl's name that would be appropriate as a sweetheart:

- Porter—(Carrie)
- Sexton—(Belle)
- Doctor—(Patience)
- Dancing Instructor—(Grace)
- Minister—(Mary)
- Fisherman—(Minnie)
- Florist—(Rose, Violet or Lily)
- Chorister—(Carol)
- Musician—(Viola)
- Oil Man—(Ethyl)

### HEART SHOOTING CONTEST

Stretch a cord between two points in the room and hang from it by strings about a foot apart five cardboard hearts ranging in size from two inches in diameter to ten inches.

Each heart has a number on its face—the smaller hearts have the larger numbers and the larger hearts the smaller numbers. Each player in turn must stand six feet away from the row of hearts and with a small soft rubber ball try to hit the hearts and make them swing. Each person may have five or ten trials according to the size of your crowd. If a person wishes to try the big hearts with the little numbers he may do so, or may aim for each heart in turn, or simply at the little hearts with the big numbers; the

object is to get as high a score as possible.

It adds to the fun to have partners each have a ball and both try to hit the same heart at once, scoring only the hearts which they both succeed in hitting on the same throw.

For refreshments, serve heart-shaped sandwiches, Valentine Cake with ice cream, and coffee or milk. Use a heart-shaped cookie cutter to shape sandwiches, and spread with any desired filling. Or open-faced sandwiches of any shape could be garnished with tiny hearts cut out of jellied cranberry sauce.

### VALENTINE CAKE

Make two plain cakes by your favorite recipe, using two large square pans for the baking. After cooling the cakes, cut each square in heart shape and then cut out the center. Spread boiled frosting between the two heart-shaped pieces, on the sides and on the top. Place on a large platter, decorate the top side of the cake with heart-shaped mints and when ready to serve fill center with strawberry ice cream. This would serve ten to twelve people; you probably would want to pass a large bowl of ice cream also. Save the cake trimmings for a cottage pudding next day.

### VALENTINE COOKIES

If you prefer to serve cookies and ice cream, make the Valentine cookies shown in the picture. Use heart-shaped cookie cutters in two sizes, and your favorite sugar cookie recipe. Roll the dough and cut an equal number of the large and small "hearts." Bake and then put together with colorful jelly, the larger cookie on the bottom, the smaller on top.

In case you have no favorite sugar cookie recipe here is a very satisfactory one:

### CRISP SUGAR COOKIES

- 2 cups flour
- 4 teaspoons baking powder
- 1 teaspoon salt
- 1/2 cup shortening
- 1 cup sugar
- 2 eggs
- 1 teaspoon vanilla or lemon extract

Sift dry ingredients together; cream shortening and sugar. Add well beaten eggs and flavoring; beat well. Add sifted dry ingredients, using as little flour as possible. Chill. Roll out dough 1/4 inch thick, cut with floured cookie cutter. Place on greased baking sheet, brush with milk, sprinkle with sugar. Bake in moderately hot oven (400° F.) for 8 to 10 minutes. Makes 3 1/2 dozen large cookies.

No Repair-Bill Worries with a

# Speed Queen

Some good questions to ask when you buy a washer are: "How many years will it last? Will it get dirty work clothes clean? What about repair bills and cost of upkeep?"

It won't take your Speed Queen dealer long to prove to you that a double-wall Speed Queen is the best investment you can make in fast washdays, clean clothes, long life service and freedom from repair bill worries. See him before you buy.

It was 20 years ago in 1930 that I bought a Speed Queen washer. This machine has been used three times a week for these many years without a breakdown and I think that this is really some record!

MRS. FRANK MCILVEEN  
Hudson, Mass.

I have used several makes of washers, but I must say I would not trade my Speed Queen for any I have ever seen. It can't be beat. For 2 years my machine has been out in the yard without a cover and it's still in perfect running condition.

MRS. E. C. TAIRNEY  
St. Stephen, S. C.

Eleven years ago I purchased a Speed Queen washer. I have five children and my washer has had almost daily use. Believe me, there is nothing like a Speed Queen! In all these years the only money we have put on repairs is for wringer rolls. It has given wonderful service.

MARY HOLTHAM  
Buffalo, N. Y.

## WHAT'S GONE BEFORE

Deciding to join Abe Lincoln's volunteers, Mark Wilson marries his sweetheart, Ann Clinton, and immediately leaves for camp. Ann carries on at home, fighting loneliness and worry. Meanwhile, the mortgage on the Clinton farm has been bought by Henry Bain, an unscrupulous neighbor who has tried to get Ann away from Mark.

Mark's brother, young Charlie, runs away to enlist, and soon afterwards their father, George Wilson, tells his wife Nancy that he feels duty-bound to go also. He sells off most of the cattle and arranges the farm work so that Nancy and Tom can manage it with a little help from the girls.

## CHAPTER X

ON the following Sunday morning, George walked slowly with head bent and arms locked behind him along the lane down which he and the boys had driven the cattle to pasture for years. Then he climbed the fence to look with pride across the corn that they had planted with Enoch Payne's help. Getting down on the field side, he walked through the corn, now waist high and beginning to show signs of tasseling, and finally he came to the creek bank where the spicy fragrance of the crushed mint was wafted up with every step he took.

In a shady spot on the bank he sat down, the hot sun raising the familiar creek flat odors of growing corn, mint, and the indescribable smell of creeks and ponds in the summer. Looking off down the valley toward the South and lost in his thoughts, George imagined he could almost hear the roar of battle. He thought about his sons, wondering where they were and what they were doing. He must have dozed off to sleep, for his next awareness was of someone calling his name. He straightened up to see Ann, shoes and stockings in her hand, skirts held high, wading across the creek toward him, the water in some places coming up to her knees.

"Don't look!" she laughed. "I'll be right with you in a minute."

Obediently he lay down again and closed his eyes, and soon Ann was sitting beside him, with her shoes and stockings on.

"Mother Nancy said you were down here somewhere, Dad. I was in hopes I'd find you. I wanted to talk with you."

He smiled at her, thinking how much she had matured lately. She had always been pretty, but now she was beautiful.

As he waited for her to tell him what was bothering her, she picked up a stone, tossed it into the water and watched the widening ripples.

"Well," she finally said, "I guess Father got completely fed up at last. He's been gone several days again, and when he didn't come back I asked John Crawford to find out if he had enlisted. He has."

The girl swallowed a lump in her throat.

"I can understand his going," she continued, "but it seems as though he might have said goodby."

"Maybe he didn't intend to enlist when he left," George said. "Your father's a good man at heart. Don't judge him too harshly. Maybe he

thought enlisting was a way to redeem himself. Maybe it is," he added, thoughtfully. "But how will you make out with the farm?"

"I'm tough," replied Ann, "so I guess I can take care of the cows, raise a garden and find enough for Mother and me to eat."

"That's better than some women-folks left behind can do," said George, warmly.

"Yes, but that isn't all the story. We wouldn't be able to eat if we didn't have the farm, and the farm is mortgaged for about all it's worth. Anyway, I can't handle all the crops."

"Well, most farms are mortgaged. And I don't believe anybody is going to press for payment of interest or principal while this war is on. I'm told that the bank in Owego has let it be known that they'll be as fair as they can about giving soldiers' families more time to pay."

"That's just it, Dad," said Ann, looking worried. "The bank did have our mortgage, but they sold it." She stopped talking and started nervously to pick the petals off a daisy. After a moment George asked:

"Who has it now?"

"Henry Bain."

Remembering his own difficulties with Bain on the cow deal, a shade of anxiety clouded his countenance, but he tried to reassure her.

"Well, Henry has money, I understand. He knows what you're up against, and I don't believe he'll press you."

"I'm not so sure," said Ann. "I talk-

ed with him just the other night about it, and he made some remark about there was no need for this war in the first place and why wasn't Mark home where he ought to be, working the farm instead of having a good time in the army."

Ann's cheeks reddened with resentment.

"I guess I wasn't very diplomatic," she admitted. "I told him a few things and he went away mad."

George made no comment as he watched a hen hawk sail slowly across the blue background of the sky. Finally Ann looked up at him with tears in her eyes.

"It wouldn't be much better even if Father were at home. You know how he is." Then she exclaimed:

"Do you mind if I sort of lean on your shoulder a moment, so to speak? I just have to tell somebody or it seems as if I'd burst!"

George laid his hand over hers.

"Go ahead, Ann! Talk all you want to. But remember that things are never as bad as they sometimes seem. What's the matter? Anything else besides the mortgage business? After all, nobody starves to death in this country. You and your mother wouldn't, even if you lost the farm."

"But, Dad, a girl just has to have a little pride, and it seems as if mine has been dragged in the mud ever since I can remember. Ever since I was a little girl, I've often been so ashamed that I didn't want to go to school or parties or anywhere because Father made such a fool of himself when he had been drinking. Once when I was ten years old, I was coming home from school with a lot of other girls. Father overtook us. He had been drinking and he made me get on his back pig-a-back, and we went staggering up the road. The kids laughed, but I've never forgotten how ashamed I was."

"Another time I was in Jenkstown with a bunch of other little girls and Dad came staggering out of the Lawson House. I tried to hurry my friends along so they wouldn't notice, but why is it that when a man has been drinking he always has to get right on to the center of the stage? He noticed me and began to call, and then said some-

thing foolish about 'My dear little friends.' You know how kids are. They're really cruel without meaning to be, so they began to laugh at Dad and to talk to him in order to draw him out. The more he said, of course, the more foolish he seemed. He could hardly stand up."

"There were some of the boys there, too—including Mark—and all of them were laughing as hard as they could. Gosh, how I wished the road would open up and take me out of sight for ever! For months afterwards I avoided those girls and boys, for I thought they were either sorry for me or making fun of me. I've never really gotten over it, and I've never gotten over hating booze."

"Some people think it's funny to see a drunk; to me it's tragic and disgraceful. We've lots of good cider apples on our farm, as you know, but we don't make any cider so it can't get hard and tempt Dad. That's one thing I just won't stand for."

Then, fearing to seem disloyal, she added:

"Dad's one of the best men in the world. He'd do anything for Mother and me, but he just can't help getting drunk now and then. Whenever he could get his hands on a few dollars, he would be gone for days, and Mother and I had to do the chores and all the farm work, or get somebody like Enoch Payne to come in and help. When Mother and I have worked and saved to get a little butter made and taken it to town and sold it, time and again Father has got his hands on that little cash and drunk it up. I don't want to complain but I never had much of any Christmas or much of any fun until Mark and I started going together. Now —" she started to cry—"maybe I've lost him."

"Here! Here!" said George, patting her shoulders awkwardly. "Don't do that! You know what Mark and Charlie mean to Nancy and me, and we don't feel we've lost them, nor are we going to. We've just got to keep hoping and praying."

"Yes," said Ann, struggling to regain her composure, "and now you're going away. What are we going to do with all the men gone? I've had to give up the idea of teaching this winter, for I can't do that and keep the farm going. The farm is our home and I want to hang on to it."

George looked at the earnest, troubled face of the girl and after a moment answered her:

"Well, let's look at the bright side for a moment. As I said, maybe this experience will do your father good. He's a sensitive, highly nervous man. That's the kind that drink too much. They need outlets. Maybe the army will be good for him. Why not think that he'll come back more determined to take hold of things in the right way, more resolved to let the booze alone. Instead of being ashamed of what he has done in the past — maybe he couldn't help it — why not be proud of what he is doing now, carrying a gun for his country! Instead of thinking that you're never going to see Mark or your father or any of us again, why not think that the more of us who go now, the sooner it'll be over and we'll have peace and all be home in this nice farm country again?"

"While you work and help to keep things straight here at home, you can plan for the day—maybe not too long distant—when Mark will be back and you'll have a little home and farm of your own, with children. Gosh, girl, when I look at you or my sons, I wonder if you ever stop to realize what a precious possession youth is!"

George stopped, amazed at his own eloquence. It was one of the longest speeches he had ever made in his life. He smiled a little to himself, thinking that there was something about these emotional times and this daughter-in-

(Continued on Opposite Page)

CONT. W.L. Nelson

# NO DRUMS

(Continued from Opposite Page)

law of his, whom he loved, that brought him right out of himself.

He was quiet, thinking he had said too much. A bullfrog croaked across the creek; a chipmunk ran down a tree and sat up inquiringly in front of them.

Ann laughed. "I wonder if bullfrogs and chipmunks don't have their troubles too."

"You bet they do," George answered smiling. "Trouble is a basic law of life. Whether it be humans, animals, or plants, we all have our enemies and there must be some good reason for it or the Creator would not have it so."

"Well, I'll bet," said the girl, gratefully, "that no one else has as nice a broad shoulder to weep on as you have given me this morning. I'm a little ashamed that I spilled all my troubles like a big baby, but anyway you have made me feel a lot better and I'm grateful. I hope you don't mind too much."

"Of course not!" he replied, embarrassed. Then he got up, reached out a hand to Ann and pulled her to her feet, "When I left the house this morning," he said, matter-of-factly, "I think I smelled chicken cooking. There's a lot of grand smells around a farm home, but chicken cooking on a Sunday morning, with prospects of dumplings, lots of chicken gravy—and, by the way," he interrupted himself, "I saw Nancy out this morning picking some of those early sour harvest apples and putting them in her apron. I'll bet you that the fried chicken and dumplings and all the other fixings this noon will be topped off by apple pie. Let's go investigate!"

The next morning George left. Both he and Nancy were determined to show no emotion, but it seemed to Nancy that a piece of her heart was packed with every one of the few articles of clothing which were put into the old carpet bag. Before closing it, she carefully shut the bedroom door, and put into the bag a note saying the words she could not speak: "Dear George:

"Take care of yourself. Give my love to the boys if you see them, and always remember that I love you."

Your wife,  
Nancy"

When the moment came for George to leave, he kissed the little girls, shook hands with Tom, and told him:

"You're the man of the house for a while now, Tom. Take care of things for me, won't you?"

Throwing his shoulders back, Tom answered stoutly:

"I will, Pa. I'll do the best I can."

Suddenly George pulled Nancy into his arms and kissed her hard. Then releasing her and brushing away unexpected tears, he quickly went out the door and down the road, for he had decided to walk the short distance to Jenkstown where he would take the stage. When he turned to look back from the road, Nancy waved at him, and he knew that their parting took far more courage for both of them than he would ever need in battle.

—A.A.—

## A GOOD IDEA

**P**ROFESSOR L. A. Maynard, Director of the Cornell School of Nutrition, believes that milk can be sold by vending machines as well as any other drink. Experiments with these machines were conducted during the last half of 1950 with students and Cornell University workers, with the hope that if successful the machines would make another outlet for milk and improve the health of consumers. Some of the conclusions from the operation of these machines are interesting:

When both chocolate milk and plain milk were sold between meals and at

## SLIDING SONG

By Edith Shaw Butler

Over the brow of the hill they go,  
Over the crusted, glistening snow,  
Over the still white countryside,  
Over the frozen brook they slide.  
Scarlet mittens and scarlet hoods  
Are bright against the neighboring woods,  
Where pine trees and the hemlocks sigh,  
Dark against the deep blue sky.

the same price, three times as much of the chocolate milk was used. But when chocolate milk was kept at 10c and the plain milk at 5c, then both sold in about the same amounts. However, at noon, when people buy milk to go with their lunch, more plain milk was sold. Two of the machines sold 9,000 half pint bottles in one month alone.

Plans are under way to test the idea in industrial plants and schools.

—A.A.—

## FARM AND HOME WEEK MARCH 19-23

**T**HE 40th Farm and Home Week will be held at Cornell University, Ithaca, N. Y., on March 19 to 23. The entire program will be geared to farm and home problems in relation to world conditions, and it is expected that attendance will approximate last year's figure of over 16,000.

Farm and Home Week, which is the largest agricultural affair of its kind in the Northeast, is sponsored by three colleges—Agriculture, Home Economics, and Veterinary Medicine plus the School of Nutrition. Also cooperating is the State Experiment Station at Geneva.

A few of the subjects that will be covered are: How to stretch the food dollar; farm planning for 1951; new social security regulations; taxes and farm prices, and the farm labor supply.

In the production end of farming there will be talks and demonstrations of interest to dairymen, poultrymen, gardeners; in fact, all types of agricultural interests will be covered.

—A.A.—

## OLDEST FARM GROUP MEETS JANUARY 24

**J**ANUARY 24 is the date of the New York State Agricultural Society meeting in Chancellor's Hall, State Education Department, Albany, N. Y. This will be the 119th meeting of the oldest farm organization in the State. The theme of the meeting will be "The citizen's part in the nation's world responsibilities."

Among the speakers will be President Fred Sexauer of Auburn; William Collins, national director of the National Federation of Labor; Roy Green, economist of the National Association of Manufacturers; Herrell DeGraff of the State College of Agriculture, and Congressman W. Sterling Cole. The usual banquet will be held in the evening, at which time Governor Dewey will present Century Farmer Citations to three New York State farm families.

—A.A.—

## WHEN YOU CATCH A COLD

A cold is most contagious when you're just coming down with one. During the first 24 hours, isolate yourself, stay quiet and warm, and you'll protect other people from catching your 'virus' and you'll have a better chance of getting over the cold yourself without serious complications.

# Killing Poison Ivy In APPLE ORCHARDS

**A**THOROUGHLY tested method of getting rid of poison ivy in apple orchards is described by E. G. Christ of New Jersey Agricultural Experiment Station in a recent issue of Horticultural News, official publication of the New Jersey State Horticultural Society.

"Poison ivy is often a problem weed in apple orchards, especially in those grown with a sod cover," Mr. Christ points out. "When poison ivy becomes well established under a tree, it forms a thick ground cover and a tightly matted root sys-

"The material 'Ammate' was used at the rate of one pound in one gallon of water. About two gallons of spray

After

Before

were needed to cover thoroughly the poison ivy beneath a tree with a 30-foot spread. The ivy foliage was sprayed thoroughly, but there was little or no runoff. 'Ammate' should be used with some caution because it will kill foliage and limbs of the apple tree. Where ivy is climbing the trunk of the tree, it should be cut down and not sprayed while on the tree. Two

men are needed for the job. One is needed to hold the low limbs of the tree while the other applies the spray.

"Some growers have had success using 'Ammate' at the rate of three-quarters of a pound in one gallon. Lower concentration than this is not recommended. 'Ammate' should be applied sometime during June and until mid-August. One application will kill most of the plants, but a second spray may be necessary after about two weeks to kill some few plants that survive. Last year one spray seemed to kill practically every plant and the hot, dry weather following the application increased the effectiveness of the spray."

"One spray was applied beneath 30-year apple trees in June, and practically all ivy was killed. A few scattered plants continued to grow under the sprayed trees and should be sprayed to prevent their multiplying.

On the farm of T. K. Bullard of Schuylerville, N. Y., apples are brought from the orchard to the packing house in trailers which hold about 40 bushels and which are hooked to tractors. Mr. Bullard in the background is watching while the front end of one of these trailers is being elevated by a hoist so that the apples unload gently onto a grading table. The board being operated by the man at the right is swung back and forth to govern the speed with which the apples are delivered to the table. The grease pails near the top of the picture are counterweights.

Mr. Bullard reports that this arrangement saves a vast amount of time, and the apples can be handled with very little bruising.

# KERNELS, SCREENINGS and CHAFF

## SUNNYGABLES NOTES

By John Babcock

**J**UST AS sure as death and taxes is the defense program our country is committed to, and the controls and restrictions that go along with such a development.

As farmers, our chief concern with the industrial phase of those controls is what the effect will be on our farm equipment supply. When the offices for enforcing controls are organized, how much will farm equipment manufacturers be cut back? Since restricted production during the mid-forties, manufacturers never have caught up with the demand.

In shaping a defense effort, our country cannot afford to roll back farm equipment production. If anything, we must increase the production of essential farm tools.

We have about ten million more people in this country to feed than we did in 1940. We are feeding an increased proportion of the rest of the world. Our growing army must have a better diet than Americans have on the average—more animal products requiring increased crop production.

We can meet these production requirements on the farm if we have the machines to make up for an ever-shrinking farm labor force. And we can have these machines without gouging into the needs of our armament program. All important as farm equipment is to meet our food production goals, it does not represent a large segment of our country's industrial production.

Farm equipment manufacturers use less than four percent of the finished steel produced in this country. They hire less than one half of one percent of the nation's gainfully employed.

If there must be cut-backs on what the government calls civilian goods, that pinch certainly can't apply to farm equipment. Scare buying on our part won't help anything, either. I think the fast maturing judgment of our country and its leaders recognizes that the root of our world upheaval can be traced back to a miserably empty stomach.

### FEEDING PASTURES

Last summer, we irrigated about 30 acres of our hay and pasture

lands at Sunnygables. Judging by the number of milkers that the watered land carried, it produced about twice what it would in an ordinary year with the customary summer dry spell. That meant twice as much plant food was consumed.

This year we did not even look up our records to see when these seedings were last fertilized; we are so sure that they used more than a normal amount of plant food that we will give them all a "shot in the arm." The first treatment will be with 0-19-19, which carries boron. If we had had the money, this would have gone on last fall. The next best thing will be to get it on early this spring.

Late in December, I saw a truck spreading fertilizer on a New York State farm. There was snow on the ground. When that snow melts and runs off, it seems to me that the fertilizer will run off too. We will follow recommendations and apply our fertilizer as soon as we are reasonably sure that the snows are over, and the ground drained.

### Second Shot

After the first cutting, we will go over all of our irrigated hay and pasture lands with 300 pounds of 0-20-20 per acre. This phosphate and potash treatment will not con-

tain the boron included with 0-19-19, but I understand that the boron lasts longer anyway.

The rule we are trying to follow is to use at least 600 pounds of top dressing a year on irrigated land. Where the seedings run less than 50 percent legumes, nitrogen will be included. One of the tricks in holding brome-ladino-alfalfa seedings seems to be to feed the legumes well. Otherwise, the grass tends to run them out, and the stands lost their productivity when these same grasses become sod-bound.

Tom Milliman, who writes this page every other time, has encouraged me to go even higher than 600 pounds per acre this spring. We can't quite afford to do that, but agree that 600 pounds is a minimum.

### TAPING WATER PIPES

Although we have had a very cold winter this far, the one big problem that has plagued us year after year has disappeared. A common Christmas or New Year's morning sight at Sunnygables used to be one or two of us running hot water or a blow torch to the barn to thaw buckets and water pipes. We've had to replace more than one burst pipe.

Over the past two winters, we have gradually protected all our exposed pipes with lead-covered electric tape. When properly installed, the electrically heated tape has prevented any freezing at all. Since it is thermostatically controlled, it draws electricity only when the temperature drops to a dangerous level. The current used can scarcely be found on the light bill.

### MANURE HANDLING

In the pen stable dairies at Sunnygables and at Boots' neighboring farm, the plan for handling manure includes daily scraping of the paved feeding areas and, in the case of Boots' stable, cleaning the pen once during the winter.

This winter has been so rough that we are behind on our manure handling. Snow does such a good job of protecting plants that it is called the poor man's manure. It

has done such a good job of preventing the ground from freezing that we haven't been able to get out on the land with any real manure for some 6 weeks.

The boys plan to work together when the weather breaks the right way, using two spreaders, a tractor and scraper, and a tractor with power fork. The job will go fast once they can start, but in the meanwhile, Boots' cows are growing ever closer to the ceiling of his pen.

### Power-Take-Off Spreader

Perhaps the solution in the future will be a large power-take-off spreader. Such a machine can be loaded with daily feeding area scrapings, and when full, unloaded in a convenient pile for power fork handling when spreading could be undertaken again.

As I understand it, the beaters of a power-take-off spreader can be removed, so that it is in effect a self-unloading wagon, the regular conveyor chain doing the job. There would be very little loss of plant food from manure handled in this way, since it preserves well in cold weather. At the first break in the weather, the unloaded pile could be picked up again and spread.

### Frozen Spreader

During the coldest weather, the scrapings from our paved feeding area froze up in the spreader when it was left overnight. There is so much liquid, and so little straw in these scrapings that the only way the load could be removed was by the old Armstrong method—with a manure fork.

Jack felt very silly standing on top of a manure spreader, pitching off by hand, right in sight of the neighbors. Someone suggested that he spread a little stock salt in the bottom of the spreader to prevent the conveyor bars from freezing fast. We haven't tried it yet. The salt might prevent hard freezing, but I am afraid it would raise the dickens with the steel chain and bars through corrosion.

The accompanying sketches show the old-fashioned broad-axe loaned to us by our Inlet Valley neighbor, Bill McMillan, to help solve the problem of getting long grass out of our trench silo; and the "steps and stairs" system we have hit on as the easiest way of getting the silage out.

The axe is the same as used for barking trees, with a flat face on one side and a short handle angling away from the flat face to permit a man to make a close, straight cut even when chopping right next to the perpendicular face of the silo. The head weighs 7 pounds, so there's no need for a long swing—just raise it shoulder level and let 'er drop.

Eight-inch cuts drop off the face of the silo with a slight twist of the wrist, but we couldn't go through 12 feet of silage that way so we hit on the step idea. Each cut is two feet deep and only 8 inches wide, but when we cut one step we then have 16 inches to stand on to tackle the next. The diagonally ruled portion in the sketch shows what our next cut will be.

The progress in controlling mastitis has been little short of marvelous. You may be one of the few dairymen who is handling this trouble satisfactorily. If not, you will be interested in a folder on mastitis which you can get from E. R. SQUIBB & SONS, Veterinary and Animal Feeding Products Division, Dept. AA-12, 745-5th Avenue, New York, N. Y.

Housewives who enjoy compliments on their cakes may wish to send to R. B. DAVIS COMPANY, Dept. AA-3, Hoboken, N. J., and ask for a set of "quick mix" charts.

Complete information about the Seaman Rotary Tiller is yours for the asking. Just cut out the coupon on the last page of the December 16 issue and send it to the PETZ-OLD EQUIPMENT CO., 600 Fifth Avenue, Owego, N. Y.

W. W. Manning of the BRADENTON CHAMBER OF COMMERCE in Florida, will be glad to send you a 4 color folder giving reasons why you would enjoy visiting or living in that area.

The Pennsylvania Salt Manufacturing Company has recently started to manufacture a new 12-ounce aerosol bomb. This is being marketed under the PENNSALT KNOX OUT label. This will rid a 10-foot square room of small flying insects when the spray is released in all directions for five seconds and the room closed for 15 minutes.

Purina Mills has recently announced that Dr. Roland Bethke, assistant director of the Ohio Agricultural Experiment Station is now vice president in charge of research and control of the RALSTON PURINA COMPANY. Dr. Bethke is a well-known authority in his field.

The RADEX COMPANY of Hudson, Wisconsin, has recently announced a new product — the Radex Air Conditioner designed to improve personal comfort and increase efficiency in milk houses and poultry houses. The unit is electrically operated and is thermostatically controlled so that it can be set at any temperature from 20 to 90.

William Clark, vice president of J. I. CASE COMPANY, who has had general supervision of the domestic sales at the Company, has been, at his own request, relieved of this responsibility. He will continue as vice president and director and will serve in a consulting capacity. Mr. Clark has been with the J. I. Case Company nearly 20 years.

The DUPONT COMPANY is making a new product known as "Deenate" 75-W DDT. It is a wettable powder containing 75% technical DDT and is a more efficient product for farm use. It will be offered in packages from 1 to 7 pounds and in 50-pound packages.

A new power rotary grooming brush made by the Hardware-Machinery Division, Sunbeam Corporation, Chicago, Illinois.

## Service Bureau

By H. L. COSLINE

The XYZ Hair Restorer Company  
Podunk, New York.  
Gentlemen:

When you sent me the jar of compound to grow hair your instructions advised that the preparation was to be massaged into my scalp. Isn't this injurious? For if it will grow hair on my head, won't it do the same on my fingers when I massage it in my head?

Please advise me regarding this before I start rubbing my scalp.

Yours truly,  
John Citizen.

## AUTO ACCIDENTS KILL 100 A DAY

"Thirty-six thousand persons will be the 1950 traffic death toll if the final figures, when compiled, equal those of the first 7 months—a total exceeded only once (1941) during the last thirteen years."

These grim words were in the September issue of Public Safety magazine. Think of it—more than 36,000 persons will be killed on our highways because of automobile accidents this year—an average of 100 A DAY, every day of the year!

The July death toll was the highest since 1941. For a comparison with last year read over the chart below, which gives deaths by months for the first 7 months of 1950 and 1949.

MONTH	1949	1950
January	2,350	2,470
February	1,970	2,210
March	2,150	2,470
April	2,340	2,740
May	2,430	2,670
June	2,370	2,610
July	2,790	3,150
Seven Months' Total	16,400	18,320

This report lists only the number of tragic deaths. Add to those the many thousands who are still recovering from painful injuries, and it is no wonder the National Safety Council is alarmed about our nation's traffic safety problem.

— A. A. —

## POST YOUR FARM LEGALLY—PROSECUTE TRESPASSERS

Last year I purchased 100 of your No Trespassing signs and posted my farm in accordance with regulations you sent. Many hunters ignored them, and during the year many of the signs were torn down. Before hunting season started this year, I replaced all damaged and missing signs. Again hunters ignored them, destroyed them with slugs or shots, or tore them down. When I met hunters, they either claimed they didn't see the signs or that the land wasn't legally posted because some of the signs were attached to large trees on the line rather than to wooden posts. How can I stop this trespassing?

Every year we get many such letters from land owners who are overrun with careless and destructive hunters. In New York State the best way to put a stop to such defiance of No Trespassing signs is to have a trespasser arrested. Get his hunting license number and car license number if possible. Then report him to your Game Warden or local police authorities. Of course, you should first be sure your land is legally posted.

The Service Bureau has found that arrest and conviction of a trespasser on your property brings a marked respect for your signs from other hunters.

It is a misdemeanor in New York State for any person to injure, deface or remove a No Trespassing sign or to trespass on property after it is posted for the purpose of hunting, etc. Signs can be attached to large trees along the boundary of your property if they are clearly visible to anyone approaching your land. There is nothing in the New York law that says they must be attached to special posts.

## Car Shoots Across Road - Jumps Ditch Flips Into Trees

Robert Armstrong, of Long Eddy, N. Y. driving alone, was but two miles from home on route 97 when his car sped off the highway and crashed into a clump of trees. He was found dead beneath the wreckage.

## \$2,000.00 - - Double Benefits Paid

Mr. Armstrong increased his policy to Double Protection just a few years ago. I remember at the time we both felt it was the only thing to do.

When the tragic word reached me I was sorrow stricken. The comfort of many friends and your representative was a blessing to me.

I do want to thank you for the check of \$2000.00 paid to me from Mr. Armstrong's Double Protection. There is no need to say again how helpful you have been. I do want to urge other folks to keep up this worthwhile protection. I know how much Double Protection means.

*Emily Armstrong*

## Lower your costs and upkeep with new 1951 Chevrolet Trucks

They're tough and they're thrifty, these new Chevrolet Advance-Design trucks for 1951. They're engineered from the ground up to deliver power where you need it, when you need it—as long as you need it. They're built to carry heavy loads—lots of them—to stay on the job day after day, mile after mile. They make every last drop of gas deliver its utmost in power output—no other type of engine matches valve-in-head efficiency. They have cabs built for greater driving comfort. See the ideal combination of hauling power and economy—the new 1951 Chevrolet trucks—at your Chevrolet dealer's today.

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICHIGAN

**Advance-Design Trucks**

### Get more horsepower at the clutch

Chevrolet heavy-duty models with Loadmaster engine have greater horsepower at the clutch than any of the principal standard-equipped conventional makes in their weight class, 14,000 to 16,000 lbs., G.V.W.

### Cut your costs on gas and oil

The high efficiency of Chevrolet's great valve-in-head engines means that fuel burns more evenly and smoothly. This means more miles per gallon, less money spent for gas and oil, all-around operating economy.

### Save on purchase price—gain on trade-in

Chevrolet's low prices save you money right at the start. And you save again when trade-in time rolls around. As America's most popular truck, Chevrolet traditionally has greater trade-in value.

**Check Chevrolet's Advance-Design Features:** TWO GREAT VALVE-IN-HEAD ENGINES—the 105-h.p. Loadmaster or the 92-h.p. Thriftmaster—to give you greater power per gallon, lower cost per load • POWER-JET CARBURETOR—for smooth, quick acceleration response • DIAPHRAGM SPRING CLUTCH—for easy-action engagement • SYNCHRO-MESH TRANSMISSIONS—for fast, smooth shifting • HYPOID REAR AXLES—for dependability and long life • NEW TORQUE-ACTION BRAKES—for light-duty models • PROVED DEPENDABLE DOUBLE-ARTICULATED BRAKES—for medium-duty models • NEW TWIN-ACTION REAR BRAKES—for heavy-duty models • NEW DUAL-SHOE PARKING BRAKE—for greater holding ability on heavy-duty models • NEW CAB SEATS—for complete riding comfort • NEW VENTIPANES—for improved cab ventilation • WIDE-BASE WHEELS—for increased tire mileage • BALL-TYPE STEERING—for easier handling.

# AMERICAN AGRICULTURIST

THE FARM PAPER OF THE NORTHEAST

## How to Raise CLEAN PULLETS In 1951

By Monroe C. Babcock

**I**TOLD Editor Ed Eastman of the AMERICAN AGRICULTURIST that I would write a few articles on chickens for him if I didn't get a whole lot of letters from his readers, asking me a raft of questions. He said that if I got any letters, I could send them down to the AMERICAN AGRICULTURIST and they would answer them.

All right, here goes on How to Raise Clean Pullets in 1951. Many a time you and I have heard poultrymen say that the first flock of pullets they raised was the best flock they ever had. Frequently they think it was because that particular flock of chicks was the best flock they ever had. Frequently they think it was because that particular flock of chicks was better than any flock of chicks they have had since then. Actually here is what has happened:

When they raise their first flock of chicks, they have a clean farm with no birds on the

place. These chicks are raised under clean conditions. By this I mean there is no disease on the farm for the chicks to get, and chicks grow up into pullets that have clean "guts," if you will pardon the expression. Pullets raised under such conditions perform at their maximum inherited efficiency. Gradually each year a certain amount of infection gets on the farm. Perhaps it is tracked in by other poultrymen, salesmen of various sorts, and perhaps some of it can be brought by wild birds.

### Infection Builds Up

Anyway, gradually the flock does build up an infection of disease which passes on from one generation to another. Each time it passes on to the next generation, the disease starts to flex its muscles and become more potent and virulent and the result is that each succeeding flock of pullets is not quite as nice as the earlier flocks.

No hatcheryman or breeder is able to supply chicks that will resist all types of disease on all farms. I will grant that there is a terrific difference from one strain to another in resistance to the fowl leukosis complex, coccidiosis, and various and sundry ailments, but no one to my knowledge has a strain that will perform at maximum efficiency under an environment where pullets have to live along with a massive infection.

Some poultrymen think that fowl leukosis, for example, comes along with the chicks. The Regional Laboratory, operated by the government, at East Lansing, Michigan, has promoted the theory that the disease passes from the parent through the egg to the chick. Work done at Cornell indicates that if any fowl leukosis passes from the mother through the egg to the chick, this mode of spread is negligible. Practically all breeders and hatcherymen will tell you the same thing, because they have customers who have had little or no leukosis and others who have had a lot of it right from the same parent flock. I believe Cornell has proved this quite conclusively on their leukosis susceptible and resistant strains.

We were curious about this in 1949 and ran a little experiment. We raised approximately 11,000 pullets, about half on one farm and about half on our other farm. The ones raised on the home place, where we had old hens, were raised right in the same building with old hens. In fact, some chicks were just on the other side of a wire screen. The other half of the chicks were raised in colony brooder houses on a range which was probably four hundred feet west of any old hens, and there was no contact back and forth between the hens and the chicks. The man who took care of these chicks was careful not to go in with the old hens. He took care of these chicks and did nothing else except a little work with the horses. Since most of our wind comes from the west and southwest, the wind was not blowing from the old hens towards the chicks, but rather it passed the chicks before it got to the hens. Whether fowl leukosis is wind-born or not, I don't know, but I suspect it is.

### Clean Pullets Lay Best

Anyway, to make a long story short, we have now finished a year of lay on these two groups of birds. I would like to say that as layers these pullets were housed in the same buildings, but in separate pens. When they were housed, they were not culled, and they were not culled during the year. The hen-housed average on those raised on the clean range was 248 eggs per bird, which is really knocking out the eggs.

On the other hand, those raised under exposure where they were right near the old hens from day-old until they went on range at eight to twelve weeks of age were also housed as they came off the range and not culled at any time during the laying year. These birds averaged 218 eggs per bird, or 30. eggs per bird less than those that were

(Continued on Page 9)

*More Farmers in this Region...*

*... raise More Chicks on*

# **G.L.F. Chick Starter**

*than Any Other Feed*

**W**ITH the baby chick season still in its early stages, the evidence is already clear. Again this year, poultrymen are making G.L.F. Chick Starter their number one choice.

The basic reason is simple—G.L.F. Chick Starter does a fine job and does it economically.

Large scale commercial poultrymen, who have the time and the knowledge to go into the nutritional details of feed, to run controlled tests, to keep accurate cost records, select G.L.F. Chick Starter more often than any other feed. It is first choice also among dairymen and crop men who keep a few hundred chickens, as a sideline.

Big commercial operators and small

flock-owners are alike in this—they want to see their chicks grow fast, keep healthy and vigorous. And they don't want to spend any more money than necessary doing it.

G.L.F. Chick Starter fits that prescription. It fits because a farmer-owned feed business, working closely with public and private research people, is the best way in the world to keep feeds up to date. And because volume buying, modern plants, and cooperative distribution keep costs down.

Have G.L.F. Chick Starter on hand when the chicks come.

Cooperative G.L.F. Exchange, Incorporated, Ithaca, New York

#### ***New in '51***

To the high energy, high vitamin formula of G.L.F. Chick Starter, a new ingredient has been added—terramycin. Terramycin, the antibiotic now used in the G.L.F. formula, is one of the so-called wonder drugs like penicillin and streptomycin. It has been found that a small amount in a good, complete chick mash gives faster early growth and improves the birds' health. So it's now in G.L.F. Chick Starter.

Before you invest in a tractor tire, check to see

# ***Does it have All Three?***

**America's First-Choice Farm Tire is SUPER-SURE-GRIP —**

**the only tire that gives you all three extra traction features**

**1**

## **WEDGE-GRIP ACTION**

Note how Goodyear SUPER-SURE-GRIP lugs are set closer together at the shoulder than at the center—don't flare out as in most tires. *Result:* soil is *wedged* between SUPER-SURE-GRIP lugs, giving a stronger, firmer grip.

**2**

## **STRAIGHT-BAR LUGS**

Because Goodyear's husky lugs are set straight as a ruler, they give more gripping surface than lugs that toe in. *Result:* SUPER-SURE-GRIPS give full-lug pull for their full length and depth—"the greatest pull on earth!"

**3**

## **SELF-CLEANING O-P-E-N C-E-N-T-E-R**

Only Goodyear gives you this O-P-E-N C-E-N-T-E-R design with even-balanced, equal-size, wedge-grip lugs — with no mud-collecting hooks. *Result:* more even pull, smoother ride, longer wear!

# THE EDITORIAL PAGE

## "IF THIS BE TREASON—"

AT A TIME when every person in this nation (whether he realizes it or not) is struggling under a burden of direct and indirect taxes more ruinous than at any other time in the history of the nation, President Truman submits another tax budget far greater than any other President has ever called for either in war or peace time. His budget asks for \$71,594,000,000 for the coming fiscal year.

No human being has any way of realizing how much a billion of anything really is, to say nothing of 71½ billion. But anyone who does any thinking at all knows what such government spending will do to the nation and to every individual in it.

Some of that huge expenditure is necessary for national defense. I have no quarrel with that. But in common with millions of other taxpayers I resent bitterly Truman's insistence that the cost of socialistic schemes—which not only help to ruin us financially but are contrary to our American liberties—be added to an already ruinous budget. These schemes, as you know, include: the Brannan Farm Plan; socialized medicine; Federal aid to education; subsidization of agriculture, followed by iron controls; further nationalization of electric power; and the expansion of government ownership and operation of business.

Even great leaders of the Democratic Party like Senator Byrd of Virginia say that at least 7 billion dollars can be cut out of this all-time high budget by some economy in domestic policies and enterprises.

No bureaucrat need ask me as an editor to help raise money to pay government expenses as long as the national budget provides for the gradual taking over of our American way of business and of life by the socialists and the rapid destruction of our liberties. In the words of Patrick Henry: "If that be treason, make the most of it!"

## LIQUOR COSTS COMPARED TO MILK AND EDUCATION

IN 1946, the latest year for which I have figures available, people of the United States paid \$8,770,000,000 for alcoholic beverages, according to figures assembled by the National Forum, Inc. During the same year, the total bill for all education—schools and colleges—in the United States was only \$4,000,000,000, or less than half of what the people paid for beer, wine and distilled liquors.

To make another comparison, the bill for alcoholic beverages in 1946 averaged \$236.13 for every family in America, while the milk bill for each family averaged \$155.34.

Omitting all argument about the right or wrong of drinking liquor, and all argument about the effect on one's health, how much argument from a dollars-and-cents' standpoint can the American people have about the cost of milk or of education when they are paying so much more for liquor?

## GREAT-GRANDFATHER MADE SAME TRIP

"I have just finished reading my copy of THE SETTLERS and I want to tell you how much I enjoyed it, and especially because my ancestors made practically the same trip in 1807. My great-grandfather left Haddam, Connecticut, early in 1807, and arriving here bought the 200 acre tract which is now our farm. He made a clearing, put up a log house, sowed some fall wheat, and went back to Connecticut.

"In the early spring of 1880 he returned here, bringing his wife and his wife's brother, who bought some land across the road. . . . My son, the fifth generation, is now the operator of our farm. . . .

"My great-aunt told me some things about those early days. At the time of the War of 1812 my great-grandfather joined the forces at Fort Niagara, leaving his wife with two small children. A report came that the British and Indians were likely to reach here in a raid. Nearly all of the neighbors de-

*By E. R. Eastman*

cided to leave for Canandaigua, but Grandmother decided to stay and take care of the stock. One day three or four Indians came to the door and wanted some dinner. She told them she would feed them if they would pitch some wheat off from hay which she wanted to feed to the oxen. While they were doing that she cooked a good dinner for them. They left without making any trouble. The expected raid did not occur and the neighbors soon came back, as did her husband later from the army at Fort Niagara."—F.L.W.

SIMILAR adventures and many other thrilling experiences, common not only to the pioneers of western New York but to pioneers of America everywhere, happen to the characters in THE SETTLERS. For a copy, send \$3 to AMERICAN AGRICULTURIST, Department TS, Savings Bank Building, Ithaca, New York, and the book will be sent to you postpaid.

## LARGER AND BETTER USE OF FERTILIZER

AT THIS TIME when almost everything in the way of farm supplies costs so much more than it did even a short time ago, it is interesting to note that a ton of fertilizer of given specifications costs the farmer only 4 or 5 per cent more today than it did 25 years ago. Moreover, the higher quality of fertilizer today means a saving in both freight and handling costs.

One of the big advances in farm practices in recent years is the larger, and especially the wiser, use of fertilizers. Farmers know more than ever before how best to apply them so as not to waste them, and also farmers know that other factors being equal, there is nothing else that they can do that will increase crop yields more than an intelligent use of fertilizers.

## PUT YOURSELF IN THE SHOP

YOU WOULD not think of driving your car or your tractor year after year without putting it into the shop for a check-up. Yet that is exactly what we do with by far the most important machine which we own—our own body. Time and again we hear of friends who are sick beyond recovery from some disease like cancer because they didn't go to the doctor until it was too late.

Why not start the year right with a good physical inventory?

## NOTHING ELSE WILL CUT COSTS MORE

ONE OF my farmer neighbors said to me: "There was a time when you could buy a good cow for \$100 or even less; now they cost \$300 or more. Maybe I could afford to let a \$100 cow pick a poor living out of the stones of a poor pasture, but I surely can't afford that with a \$300 cow."

I thought that was the best argument for improving pastures that I had yet heard.

Another dairyman friend of mine said:

"I get a little irritated at this talk about lengthening the pasture season. What do you mean by it?"

Someone in the little conference where this question was brought up answered:

"We mean putting maybe two weeks on each end of the pasture season and maintaining a good pasture during the month of August when pastures usually dry up."

The columns of AMERICAN AGRICULTURIST have contained much material on how to lengthen the pasture season and improve the quality of pasture grasses. Many bulletins are available, and so is the help of county agricultural agents and other extension workers. All that is needed is the will to

plan it now and go at it a little later.

The nutritive value—that is the milk-producing power—and the palatability of a good pasture grass are about twice that of good hay. Four weeks more of pasture time means that much less hay and grain feeding. What other one thing can you do that will help you more to cut your costs of producing milk?

## LIST YOUR JOBS

EVERY MORNING when I start work in the office and about every week at home, I make a list of the jobs that have to be done either during the day or very soon. As each job is completed, I cross it off the list. I find that this simple plan helps to get necessary work done on time. For example, your weekly list might look like this:

- Pay income tax
- Start new farm accounts
- Get out season's wood
- Prune the orchard
- Get ready to tap the maples
- Overhaul the tractor
- Poison the rats
- Spray cattle for lice
- Organize the farm shop
- Order baby chicks
- Get brooder house ready
- Order all supplies
- Read Whittier's "Snowbound"

Mother also might find such regular listing of household duties very helpful.

## HAVE YOU MADE YOUR WILL?

MY FRIEND Ed Thompson, former President of the Federal Land Bank of Springfield, Massachusetts, recently pointed out the importance of farmers making wills, especially now because of the high capitalization that almost every farmer has in his business, and because of inheritance taxes and other problems that surround the passing on of property.

Wills made without the help of a lawyer are frequently invalid and a source of trouble. If you haven't made a will, take this as a reminder and in justice to your family consult a lawyer immediately.

## DO YOU KNOW YOUR SCHOOL?

MUCH OF the misinformation and lack of knowledge that we have about schools is due to the fact that we think of them as they were when we attended school years ago. But schools are making progress along with everything else, and most of them are doing an excellent job in spite of the many problems and difficulties they have to meet.

The schools—that is, your boys and girls—need your sympathy, attention and help. Before you criticize, wouldn't it be fair for you to get acquainted with the teachers, visit the schools in session (you'll always be welcome), join the Parent-Teacher Association, and give these educational institutions which are America's most important business your support based on understanding of what the real problems are?

## EASTMAN'S CHESTNUT

A YOUNG fellow was just starting to learn the barber trade. One of his first customers was a man with one arm.

The would-be barber lathered him up, stropped the razor back and forth on the strap. But his professional air was only a bluff. His hand trembled, and he nicked up the customer pretty bad. To cover his really serious situation, the barber started to talk:

"Let me see, haven't I shaved you before?" he inquired.

"No," sadly answered the customer. "I lost my arm in a sawmill!"

# AA's Farmers' Dollar Guide

**FOOD PRODUCTION:** U. S. milk production for December was 1½ per cent below December, 1949. At New York State milk plants, receipts for December were 6 per cent below last year. The so-called butter surplus is disappearing, and current butter production is about 20 per cent below a year ago. High meat prices will encourage close culling of dairy cows. In view of these facts, milk production will be none too large in 1951.

Animals are being fed heavily. However, on January 1 total feed supplies were larger than any year except 1943, '49 and '50, and feed per animal unit was larger than any year prior to '49 with the exception of 1947.

With food demand high it looks like good business to feed the largest possible amount of the best possible roughage, sell meat animals before they reach top weights, keep farm animals healthy, and kill rats (new warfarin is excellent).

**EGGS:** The U. S. laying flock in December was 3 per cent below last year, but 1 per cent above average. Potential layers on farms January 1 were 4 per cent lower than last year and 5 per cent below average. Prediction is being made that chicks bought now will be highly profitable next winter.

The U. S. **SPRING PIG** crop is forecast at 6 per cent above last year and the second largest on record.

**WINTER WHEAT** is forecast at 899 million bushels—up 150 million from last year and the third largest on record.

Total 1950 crop yield was the third largest in history.

Weather has been far from perfect. Freezes in the South have hurt oats, barley and cover crops. In the West, large areas have had too little rain and snow.

Farmers will be subject to unfair attacks as being responsible for inflation. In a recent talk, Dean W. I. Myers of the State College of Agriculture pointed out that food prices are at about the level of 1948, while weekly earnings of factory workers are 10 to 15% above that period.

Total supplies of thirty kinds of grass and legume seeds are the largest on record. Chief below average seed crops were alsike clover, white clover and red top. Even with heavy crops better order seed early. Because attention is being focused on food production, the 1951 grass seed crop is likely to be smaller.

**INCONSISTENCIES:** 1. Although inflation is cited as one of the big dangers, the Administration shows no disposition to make a drastic cut in domestic expenses, which all economists agree would be an effective way of fighting inflation.

2. We are told that we must tighten our belts, do without, and make sacrifices, yet labor unions continue to demand wage increases to meet increased living costs, apparently with Administration encouragement.

3. Apparently price controls are to be announced soon, but without adequate machinery to administer and enforce them.

4. While recognizing the dangers of inflation, loose talk has been one of the chief causes of inflation. Continued talk about shortages and prospective higher prices invite panic buying. It even has been hinted that some who favor government control of everything are happy that such talk is hastening controls.

5. The importance of friendly nations abroad is emphasized, but no one tells us how we can help such friends and keep them if they refuse to help themselves.

6. The importance of increased production is emphasized, but most of those in authority want to impose price ceilings, which everyone admits discourages production.

These inconsistencies are not listed here to be destructively critical, but to point out that your representatives in Congress need to hear from you. Use your "horse sense" to reach logical conclusions, then write your representatives. They will listen to you.—Hugh Costine

## The Song of the Lazy Farmer

WHEN winter's here and cold winds blow, when ev'ry day brings threats of snow, I spend so blamed much time inside, where I can sleep and warm my hide, I actually get too much rest and end the day still full of zest. That's why I'm tickled pink to hear a meeting's scheduled somewhere near; I don't care whose or what it's for, I'm always first one in the door. I find there ain't no better way to work off steam than at, let's say, a school house argument on why our taxes have climbed up so high. And if some expert comes to town to tell us why our income's down, it almost always starts a fight that maybe lasts for half the night.

Of course, such sessions ain't all fun, because at nearly ev'ry one it's quickly very plain to see that most folks ain't as smart as me. Altho I try to hold my tongue, the evening's often pretty young when I decide the time is ripe to take the floor and try to wipe the cobwebs off the arguments by giving them some common sense. The trouble is, it's hard to show dumb folks the way they ought to go, and so I often have to speak an hour or so until I'm weak. This us'llly sells them on my way, tho one or two still want their say, but I so fully deflate some that next time they don't even come.

## If You Milk 10 Cows or Less...

# HERE'S HOW TO SAVE TIME AND EARN MORE

- ← Time-Wasting
- ← Slow, Costly
- ← Unpleasant
- ← Unprofitable

These figures, which so clearly show the faster milking and time savings accomplished by the De Laval Speedette Milker, are taken from actual time studies on average small herds under normal every-day conditions.

26 HAND-MILKED HERDS	
Avg. size of herd	5.2 cows
Avg. number of hand milkers	1.3 persons
Avg. milking time per day	146.0 min.
Avg. time per milking	73.0 min.
Avg. time per cow	10.4 min.
Avg. time per day to wash utensils	21.3 min.

24 DE LAVAL-MILKED HERDS	
Avg. size of herd	9.6 cows
Avg. milking time per day	76.5 min.
Avg. time per milking	38.2 min.
Avg. milking time per cow	3.9 min.
Avg. time required to wash milker per day	15.1 min.
Avg. time required to wash milker per milking	7.5 min.
Avg. reported daily saving over hand milking	90 min.

- ← Saves Time
- ← Fast Milking
- ← Easier Job
- ← More Profit

## DE LAVAL SPEEDETTE MILKER

In addition to time and labor savings, faster milking and more pleasant work, the De Laval Speedette Milker produces cleaner milk. It is a De Laval-quality, dependable milker, low in first cost, fast and inexpensive to install. Pump never requires oil—small motor operates on 110 v. line. See your De Laval Dealer today for full details.

73 YEARS OF LEADERSHIP IN MAKING BETTER PRODUCTS FOR BETTER FARM INCOMES AND BETTER FARM LIVING

## DE LAVAL SPEEDWAY WATER HEATER

Provides 12 Full Gallons of 185° Water

To thoroughly sanitize your equipment you need hot water of not less than 180°. The De Laval Speedway Water Heater produces not just 8 or 10 but 12 full gallons of 185° water.

For purposes other than sterilization, dilute a portion of this water with cold water and obtain as much as 10 gallons of 140° water and still have 7 gallons of 185° water for sanitizing your equipment.

Many other features...exclusive with the De Laval Speedway Water Heater assure you of most economical operation and safeguard against frequent replacement costs. Why not see your local De Laval Dealer today?

This Year **Save** on Fertilizer

use **Armour's**  
**HIGH ANALYSIS**

3 bags = 4 or more

**SAVE** money—Armour's High Analysis gives you extra plant food units—three bags go as far as four or more of the lower analyses—more plant food at less cost.

**SAVE** on handling, transportation and storage space with Armour's High Analysis Fertilizers. Get your order in early—take no chances on uncertain future conditions.

*Play Safe!  
Order Now!*

**SAVE** on loading, hauling, applying. With High Analysis in your barn, you're safe. See your Armour Agent right away. Remember, Armour's High Analysis saves you ALL WAYS.

**for better pastures**

Armour's High Analysis is ideal for improving pastures. Pastures grow greener and thicker, make more nutritious grass, clover or hay. You save on dry feeds, beef cattle gain weight faster and cows give more milk. For greener pastures more months out of the year, order Armour's High Analysis.

**NEW—SPECIAL  
FORMULA**

**Vertagreen®**

**FOR COMMERCIAL CROPS**

Tested and proven to give outstanding results by growers everywhere, Vertagreen is now available in a SPECIAL FORMULA for COMMERCIAL CROPS. It's produced in an analysis especially adapted to soils and crops in your area. Order complete, balanced Vertagreen for Commercial Crops—the premium quality plant food that makes bigger yields of premium quality crops.

## What Do YOU Think?

By JIM HALL

### I GET BRICKBATS AND MEDALS

#### Brickbat

Wow! That little old piece I wrote for the front page of our December 16 issue about the need for better rural roads (and the possibility of getting some of the money to pay for them if the huge transport trucks paid fees in proportion to their use of the roads) really stirred up some of our readers.

A lot of these men and women wrote personal letters rather than "letters to the editor," so, just in case they didn't want some of the remarks in print, I'm not going to identify them. One of my reasons for this, of course, is that, while most of the letters are from farmers, some also have definite personal interest in the big trucks.

In one letter, an Orleans County farmer who has been a friend and correspondent of mine for several years came right out bluntly and said, my article was "a vicious attack on big truck transportation" and then went on to say "that 23 states allow more gross weight than does New York."

Answer: In those 23 states, they charge for fees and taxes, on a gross weight of 32 tons, an average of \$3,400.00 per vehicle. In Florida, a 32 ton gross weight truck pays a total of \$3,136.50 for various carrier's taxes and fees; and the lowest fee in those 23 states is in the District of Columbia, where for 32 tons the total is \$1,464.08.

Next argument: "You must agree that the laws of most states are ridiculous and unjust. Let's take New York with a gross weight of 32 tons. A small tractor in the 1½ ton class and a tandem trailer has an empty weight of about 8 tons, leaving a legal payload of 24 tons; a 200 hp Diesel tractor with tandem drive and tandem trailer has an empty weight of about 15 tons, leaving a legal payload of 17 tons. The present price of the small outfit is about \$10,000 compared to \$22,000 for the large outfit. The small outfit has 4 axles, 12 small tires and 8 small brakedrums. The large outfit has 5 axles, 20 much larger tires and 10 much larger brakedrums. For the sake of human safety as well as the well-being of the roads, what does your common sense tell you? In my judgment the small tractor carrying a legal payload is suicide as well as a traffic bottleneck."

Answer: I want to emphasize again, as I did three times in the original article, that we consider trucks absolutely essential to agriculture and other business of the state. So are farmers' trucks and cars. That's why we say it is unfair to pay 23 cents to operate a light truck or car 100 ton miles while the biggest trucks only pay about 5 cents for the same use of the roads. I'm glad, too, that my critic underlined the word "legal" payload. Most trucking firms observe legal load limits but have to compete with others who overload to make more revenue each trip without increasing labor or equipment expenses. Overloading is unfair to honest truckers and certainly unfair to highway taxpayers. Police check-ups reveal that one out of four trucks overloads. A truck stopped in New Jersey last year had an overload of — hold your breath — 105,000 pounds! That was just the overload! Sticking to the weight limits the trucks were designed for would help cut down the "suicides and bottle necks."

#### Medals

A County Judge, in a letter about my article, said "it sounds very good

and very logical to me." But I was even more pleased with a letter from a farm wife in Delaware County in which she said: "A diamond medal should be awarded you for your column in AMERICAN AGRICULTURIST dated December 16, 1950.

"We travel one of the worst roads in the state of New York. Seven months of the year a car or truck cannot come up to our farm. Last year, even with a 4-wheel drive jeep with chains, we were forced to leave it at the bottom of the hill with two young calves and four bags of feed. The next day a chicken buyer was to take away our 1,000 broilers, but because of the road the sale had to be cancelled. This was a loss close to \$900, because the calves died of pneumonia by the time we could get them to the barn; and the chickens were past the broiler stage when we got them out."

#### More Brickbats

My next critic, who says he's "d--- glad he lives on a dirt road" over there in Oneida County, says he doesn't have much hope of making me see the progressive way, and makes my 40 years weigh heavily on me by adding. "Probably when I get to be as old as you are, I'll be just as conservative." His letter would take up 2 columns so I can print only a couple of points I would like to make. He wants to know how truckers make both ends meet and mentions among other things the high insurance premiums they have to pay "when they can find insurance companies that will take the risks."

Answer: Compared nationally with cars, trucks, per vehicle mile, have 3 times the number of accidents, do 16 times as much damage, and there's one death or injury for every 2 truck accidents compared with one death or injury in every 7 passenger car accidents.

Question: How does California permit huge trucks on its highways?

Answer: Legislation there is such that 55% of the total cost of highways is charged to big trucks. There a 20 ton gross weight truck pays \$1,297 fees compared with New York's \$484.

You know the road problem is not just New York's. Last year Governor Duff of Pennsylvania said: "It costs us \$4,900 per mile to maintain a truck highway and only \$350 per mile a year to maintain a highway for automobiles."

The editors of AMERICAN AGRICULTURIST are interested in having a good road past every farm worth farming, and we believe one of the ways of getting the money to do it is to see that everyone pays for the highways in proportion to the use they make of them. I think that's fair. What do you think?

— A. A. —

#### FENCE TRAINING FOR PIGS

Here is my own discovery for training pigs for electric fences. It is hard to change a pig's mind once it is made up. If they learn to go under fences, they will seldom try jumping them. Let the pigs learn to crawl under, and when they are larger just put the electric fence about seven inches high. They will still want to crawl under, as that is all they know. It will turn them every time.—I. W. D.

# Meet National Plowing Champion Lloyd Shafer

*his winning combination is a*  
**McCORMICK\* FARMALL\* TRACTOR**  
**and McCORMICK PLOW**

**National champion contour plowman** is Lloyd Shafer of Chatsworth, Illinois, shown here doing a prize-winning job with his McCormick Farmall H tractor and McCormick two-bottom plow. To qualify for

entering the national contest recently held at Urbana, Ohio, in which he scored 89.6 out of a possible 100 points, Mr. Shafer first won the Illinois State Championship with his Farmall tractor and McCormick plow.

**With good equipment you too** can use *your* skill and experience to do championship plowing. The smooth Farmall tractor 4-cylinder engine and variable speed governor provide instant responding power to surge through tough spots. The big wheels and balanced weight of your Farmall deliver fuel-saving traction. The drawbar and rear wheels adjust accurately and easily for correct draft.

With a McCormick plow you take pride in the way trash goes under—even in deepest plowing. The adjustments are so easy to make; it's a cinch to turn a neat furrow, acre after acre, year after year.

**Top honor for easy handling** . . . You'll like a McCormick No. 8 plow equipped with Farmall Remote-Control. Lift, lower, and regulate the plow from the seat of your tractor. You can't beat Farmall Remote-Control for precision lifting and lowering when crossing grassed waterways and for keeping headlands even.

**Top honors for low-cost plowing.** With a McCormick direct-connected plow your first cost is low . . . you buy only the beams, colters, bottoms, and rolling land-side. You have low up-keep costs, too, because McCormick shares and colter blades are built to resist wear and stay sharp longer.

**Top honors for tough plowing** because extra-high beam clearance, specially hardened disks, and proper weight distribution make McCormick disk plows stand up in rocky, sandy, root-infested or sun-baked soils. Direct-connected or trailing type; heat-treated disks built to penetrate and scour in hardest soils.

## New Attacks on PLOW SOLE and HARDPAN

By JIM HALL

**F**OR THREE years in the 1930's, Bill Graham of Silverton, Texas, had tried everything to keep his land from blowing away in the dust storms. He was about desperate in 1937 when the combine man arrived to harvest a sickly crop of wheat. But the combine man had some news — Fred Hoeme, up in Hooker, Oklahoma had saved most of his soil and produced fair crops, despite the dust storms, by using a homemade field cultivator.

Bill hurried to Hoeme's and at first was disappointed because all Hoeme had was a two-wheel rig with two-inch chisel-tipped shanks welded to three beams of railroad iron. However, looking at the slight amount of wind erosion on Hoeme's place, he wanted the story:

Two years before an Oklahoma highway worker had dragged a scarifier across Hoeme's field. The machine, built with long spikes for tearing up old road surfaces, had dug rows of deep furrows across the field. The next year Fred noticed that where the furrows had been dug, the wheat was a foot higher and healthier than in other places. Fred built one row of the shanks three feet apart on a railroad iron and used the rig to dig furrows in his wheat before the spring winds. Later he built the three-beam machine with shanks staggered to furrow every 12 inches and used it to follow his normal plowing.

Bill had long been convinced that constant plowing powdered the soil to such an extent that it was ripe for erosion so he took one of Hoeme's machines home and, despite neighbors' snickers, put his own ideas to work. He used the rig to plow deep instead of as a cultivator. His field didn't lie smooth and clean. In fact it looked trashy with clods, straw and vegetation and was a maze of little 6-inch furrows, 12 inches apart.

Bill dug a hole in the field and found that the chisels had cut through the subsoil and had run cracks through it in all directions. His second discovery was that the powdered dirt sifted down between clods and trash so that the wind didn't pick it up.

A week later a 5-inch rain disap-

Pictured above is a five-foot model of the Graham plow with "wings" attached for two extra shanks that give it a 7 foot span. This model is operated hydraulically. The larger models come equipped with their own wheels.

peared into this rough looking land even though on nearby fields it caked and sealed over the powdered soil, causing heavy erosion. After two years' use of Hoeme's machine, USDA experts checked and found moisture penetration to 52 inches in Bill's field as compared to 24 inches on adjoining land. The next year Bill harvested four times as much wheat as from any other field in the neighborhood!

Fred Hoeme sold his patents to Bill Graham who started manufacturing the new plow in 1939. Today his factories have a capacity of 500 a day.

### Gets Weeds Too

Weeds flourished behind the Graham plow until Bill devised two self-sharpening blades to attach in a horizontal position on the shanks. Now the earth is chiselled and the weeds cut in one operation.

Bill's plow, which looks more like a long tined spring-tooth harrow, was introduced to Northeast farmers not many months ago. Here, few are interested in the big 45-foot but the 5 to 10 foot models are being highly boosted by their owners. They are finding that by taking three bouts around the field and then angling back and forth at right angles to the natural run-off direction, the 6-inch terraces prevent washing. Some are using moldboard plows followed by the Graham to stir the plow sole and subsoil and create the soil-saving terraces, and others who want smoother seed beds are dragging a smoothing harrow or plank float behind the Graham.

The importance of breaking through the plow sole and loosening the subsoil to rid fields of wet spots and to provide a larger reservoir of moisture for dry times has been recognized by many large manufacturers who have met the need with special equipment. The Oliver TNT plow which turns a little furrow in the subsoil right under the main plow, has increased yields for all crops in every kind of soil except sand. The TNT can be set to plow 10 inches with the top base and four inches with the lower, for a total 14-inch penetration without bringing subsoil to the top.

Several companies make sub-soilers (the accompanying photo shows the new Dearborn Subsoiler capable of operating to a depth of 15" or more) and of course the rotary tillers, such as the Seaman, are designed to give uniform tillage to full depth with no plow sole to seal off sub-surface moisture.

Whatever equipment they are using, farmers who are breaking up the plow sole and hard pan are convinced that the deep penetration pays off.

One new answer to the old problem of loosening packed or impervious soil is provided by this Dearborn Subsoiler operated by hydraulic touch control.

## HOW TO RAISE CLEAN PULLETS IN 1951

(Continued from Page 1)

raised under better conditions.

I presume if this experiment had been run on birds that were not bred for resistance to leukosis, the difference would be much greater than 30 eggs per bird. It would probably be 50 or 60 eggs per bird. I think the exposed birds had more coccidiosis and various other diseases than those that were raised under good conditions. If you figure those eggs worth 4c an egg, then you have \$1.20 per bird. If you figure 5c per egg, you have \$1.50 a bird. If you have 1,000 layers, \$1.20 per bird makes \$1,200 and that will buy you a new car if you turn in the old one or will buy your wife a lot of labor-saving kitchen equipment or it will send one of your kids to college for a couple years. It runs into real dough.

### What To Do

Here are the things you should do to raise a clean flock of pullets in 1951:

First, you should study the hatcheryman or breeder who is to supply your chicks. Try to purchase from a man who has a clean place. The best way to find out whether it is clean or not is to visit it. If it is sloppy and dirty, stay away from him. If his place is clean and swept up and picked up and looks good, it certainly is one test, because if he keeps the hatchery clean he is probably clean about other things. You should buy from a hatcheryman who is trying to supply you with chicks from stock that has been exposed to leukosis over a period of years and the resistant birds kept as breeders year after year.

You are likely to get leukosis under the most ideal conditions, but if you can keep it down to a minimum, it helps. If you can buy from a strain that is highly resistant, it helps a lot. You should buy chicks from a hatcheryman who does not have started chicks or adult birds in his hatchery building. I think probably one of the chief means of first exposing chicks to disease is having adult birds right in the same building where the chicks are hatched. This is bad. A good hatcheryman doesn't have his hatchery in where there are adult hens. If there are started chicks in the building, then your chances of getting a flock of chicks with respiratory diseases, such as Newcastle and infectious bronchitis, are much greater than where there are no chickens of any kind growing or living in the building, except the day-old chicks that hatch once or twice a week.

### Pullorum Free

Of course, you and I both know that you should purchase chicks from a flock that is 100% free of pullorum infection and has been free right along. Pullorum is the name given to what people used to call Bacillary White Diarrhea or B.W.D. It kills chicks right-and-left during the first two weeks. Practically all hatchery flocks are entirely free of this disease now and it is no longer considered important, but you want to be sure that your flock is guaranteed to be free of this disease.

I find quite a few poultrymen starting their chicks in large buildings—even in buildings where there are old hens. For the commercial poultryman this is a bad mistake. I realize that some poultrymen are getting away with this okay and I wish them luck. If you possibly can, you should raise your chicks as far away from the old birds as you can. You can accomplish this by moving your brooder houses quite a ways from the old hens—let's say, several hundred feet at least. Try to have them to the windward of the old hens so the wind you get most of the time passes these brooder houses

High Efficiency  
**BEACON**  
complete  
STARTER

...available with **NITROSAL**\*

C. L. Henry, Superintendent of Beacon Poultry Research Farm feeding chicks. At his left is one of our new type experimental electric brooders using a small glass plate with metallic paint as the heating element for true radiant heat.

## ...for Faster Growth, Greater Protection against Coccidiosis, Higher Feed Efficiency

Beacon Complete Starter, a favorite with thousands of Northeastern Poultrymen, may now be ordered with NITROSAL. Our experiments to date involving more than 80,000 birds have shown that with the Nitrosal feed we get faster growth, higher feed efficiency, better pigmentation on skin and legs and greater uniformity in the flock.

Backed by 29 years of painstaking research, Beacon Complete Starter has won a reputation for balanced chick development, better fleshing and feathering with fewer barebacks—on less feed. Records show that many Beacon feeders average less than 3 pounds of feed per pound of meat at weights of 4 pounds or over per bird (9 to 12 weeks).

For the past year, Beacon Complete Starter has contained a Vitamin B12 and anti-biotic supplement for greater efficiency, faster growth. On special order, it has been available fortified with the anti-coccidiosis drug sulfaquinoxaline (continued for 1951).

Herbert D. Sprague shows how he's taken the drudgery out of washing sap buckets.

## Motorized Brushes Wash "Dratted" SAP BUCKETS

**T**HE MAJORITY of maple syrup makers believe in giving their sap buckets a scrubbing before storing them until next year. Others hold with the old idea that the buckets will keep better if stored with enough of a film of sap left on them to act as metal-preservative.

But in any case, they've got to be washed before they can be used for fresh sap—and tackling those stacks of buckets isn't exactly the most popular chore connected with sugaring. However, it can be made to go a lot quicker and easier when you put a motor to work. Photos show how two Vermonters have taken the curse off "wash day."

The simple electric washer rigged up by Herbert D. Sprague of Brandon washes clean, though it's dirt-cheap. Using an old 1/2-horsepower motor, the rest cost him only \$1.50, the main expense being his purchase of five ordinary scrub brushes for 18 cents apiece. They're screwed on to a wooden block at the end of a 1-inch shaft. One revolving brush scrubs a bucket's bottom, and the other four scrub its wall. They're spaced to fit snugly into Sprague's 13-quart buckets. At the shaft's other end is a 20-inch pulley run by a belt from the motor. The brushes are 3"x8".

Sprague, who's now 77, says he's been sugaring "more or less for 50 years." With his son-in-law, Charles

Wheeler, owner of the farm, he hangs around 800 buckets.

The washing is done by two men. One keeps feeding buckets to the brushes. The other handles two nearby tubs—one has warm water into which a bucket is dunked before going on to the brushes; then it's rinsed in the other tub, containing water as hot as hands can stand. Once when they didn't know they were being timed, Sprague and Wheeler washed 260 buckets per hour.

There's more mechanism and greater flexibility in the "expandable head" washer invented and patented by Arthur Darrah of Rochester. His is built to take any size sap bucket.

Darrah uses a cutaway 55-gallon oil drum for the housing of his washer, which weighs nearly 100 pounds. Its revolving shaft can be run with either an electric or gasoline motor, or tractor.

The four brushes are so mounted as to expand and scrub any bucket regardless of its size or flare. A foot-lever applies the pressure that operates them.

Two large brushes, 2 3/4"x10", take care of the bucket sides. Mounted on rocker arms, they expand outward and also swivel at their centers to fit the bucket's slant. The two smaller brushes at the end are 1 1/2"x7 1/2". They're expanded by a system of cables and

Arthur Darrah invented his "expandable head" washer to fit any size sap bucket.

# FROM **Swift** TO *America's ranchers and farmers...*

**In 1950 Swift paid \$1,704,489,374 for livestock and other agricultural products**

Meat packers get most of the raw material for their business from you. You get from meat packers approximately half of your annual income. Together, we play an important part in feeding America. As one factor in the livestock-meat industry, Swift shares in that vital task. On this page is a record of what we did during 1950. The figures at the right show a quick over-all picture. The figures below explain in greater detail.

*77¢ out of the average sales dollar paid to producers*

We provide a dependable year-round market for your livestock, dairy products, poultry, etc. These products of your business are the raw materials of ours. So it's only natural that by far the largest part of Swift's "sales dollar" is paid to you farmers and ranchers.

*The pictures and words below tell what the rest of that "sales dollar" goes for*

## *11 1/10¢ to Employees*

It takes skilled people to process your livestock and other raw agricultural products into Swift's quality foods. In 1950 Swift's 76,000 employees earned \$245,238,539 in wages and salaries, or an average of 11 1/10 cents out of each dollar of Swift sales.

## *4 5/10¢ for Supplies*

Last year, out of each dollar of sales, Swift & Company spent an average of 4 5/10 cents, or a total of \$100,476,643 on supplies of all kinds—mountains of salt and sugar; trainloads of boxes, barrels, other containers; miles of twine; tons of paper; fuel, electricity, etc.

## *1¢ for Taxes*

In addition to federal taxes, Swift & Company paid taxes during 1950 in all states and in many municipalities. Our total tax bill was \$21,101,712. This averaged 1 cent out of each dollar Swift received for the products it sold.

## *3 4/10¢ for Other Expenses*

Among other necessary business costs are depreciation, interest, employee benefits, sales promotion, rent, research, insurance, development of new products, advertising, stationery, postage, telephone, telegraph, travel expenses, etc. These necessary expenses took an average of 3 4/10 cents of each sales dollar.

## *2 3/10¢ for Transportation*

Swift's service helps bridge the 1,000-mile gap between producers of livestock and consumers of meat. To accomplish this necessary service, Swift's freight and trucking bill in 1950 was \$51,598,238. This is an average of 2 3/10¢ of each sales dollar for moving your products to consuming markets.

It is the pooled savings of many shareholders, and earnings plowed back into the business, that have built Swift & Company and made it possible to serve efficiently you producers of agricultural products. Among Swift shareholders you will find farmers, ranchers, lawyers, doctors, mechanics, business people—folks from every walk of life—including 38,575 women.

We hope your farm and ranch operations re-

## **Quick Facts on Swift's Business in 1950**

Total SALES of all Swift's products and by-products in 1950 added up to \$2,214,819,268  
Swift paid for livestock and other agricultural products 1,704,489,374  
Swift's total NET EARNINGS amounted to 16,142,586\*

That is an average net earning per dollar of sales of 7/10 cent

*Here's where the other 99 3/10 cents of that "sales dollar" went:*

For livestock and other agricultural products	77 cents
For employees' wages and salaries	11 1/10 cents
For supplies	4 5/10 cents
For transportation (freight, trucking, etc.)	2 3/10 cents
For taxes	1 cent
For other necessary business expenses	3 4/10 cents
<b>Total</b>	<b>100 cents</b>

\*This amounts to 2/10 of a cent per pound on all products handled.

## *7/10¢ as Earnings*

After all those necessary expenditures, our 1950 net earnings were \$16,142,586. Our shareholders received \$13,917,161 of this in dividends. This is their return on the investments made by them and on the earnings from these investments which have been retained in the company to provide the plants and facilities—the tools needed to handle your products.

## *Here's a picture of Our 1950 Sales Dollar*

Swift & Company's net earnings are small for the many essential services in the processing and marketing of the agricultural products you produce. Our earnings averaged a fraction of a cent a pound on the volume handled.

# POWERLINE design boosts MODEL B PERFORMANCE

Full line of moldboard plows, one- or two-way, mounted or pull-type, match Model B power.

Look at the clean-cut Powerline Design of this Allis-Chalmers Model B Tractor. You see clearly, down or to either side, from the tractor seat. Tubular Powerline eliminates a heavy frame. Here's more real work power . . . with less fuel. On many farms the Model B's big, 125-cubic-inch, four-cylinder engine powers field operations with more efficiency than larger, more expensive tractors.

Arched front axle and raised offset final drive give high work clearance. Weight of transmission, operator, and liquid ballast in rear tires provides traction for handling all-weather jobs.

A complete assortment of implements — mounted, semi-mounted or trailed — lets you perform field jobs with ease and economy. All match the power, weight and speed of the Model B. This tractor is fully equipped with lights, starter, cushion seat, radiator shutter, thermostat, temperature gauge and foot-operated brakes.

Big power in a compact package at a low price . . . that's the Allis-Chalmers Model B! Clip and mail the request below. This could be your long-sought opportunity to step up farming with economical, year 'round power.

Allis-Chalmers builds discs, harrows and field cultivators for the Model B.

Model B has a complete assortment of one-row planters and cultivators with fertilizer attachments.

Model B cuts hay with quiet, V-belt driven power mower. Has clearance and speed for raking.

3-Way Power Transmitter is available at small extra cost.

## "Rube" Chops Hay in Field

**M**Y husband and I read with interest the article by Mark Robinson in the June 17 issue of, *AMERICAN AGRICULTURIST*. We have been farming only four years. That makes us newcomers to the field and we have no intention of telling the old-timers what can or can't be done.

We made corn silage the first year and since then have made grass silage—the hard way. Until this year we mowed, windrowed, loaded with a hay loader and then chopped the grass into the silo with an ensilage cutter. In 1949 it took us three weeks, working every day, all day, to fill our 10x35 silo. Last summer we filled the old silo and a new one (12x25) in 11 days.

After the 1949 bout with long grass on and off the wagon and then a barn full of dry hay, we realized that a few more years of that sort of work would make us old—but quick. We also realized that the chopper or harvester to make the work lighter was out of the question for our small farm.

Necessity being the mother of invention, we took the existing equip-

ment, added \$250 and some good hard rainy-day labor and came up with the answer. Of course, it isn't as efficient as a factory-made job, in that it takes two people to run it, but it does nice work and we didn't have to go into debt for it.

We assembled the rig with materials on hand, with the exception of the wagon and motor which we bought. The wagon is on rubber and ell shaped. We removed the wheels from the ensilage cutter and mounted it on the rear of the wagon. The model A Ford motor is mounted on the front with a 10" pulley. The belt is 6" wide with a twist. Behind the wagon the hay loader is attached rigidly. It is offset so that the grass will fall into the chopper conveyor. The wagon into which the chopped material is blown is pulled behind and to the left of the chopper wagon.

We use "Rube," as we call it, to chop grass for silage and also to chop our hay. It is difficult to describe "Rube," but it does a beautiful job and we are mighty pleased with it.—Mrs. Floyd B. Lampkin, Thurmont, Md.

## Farm Buildings at Reasonable Cost

**I** AM enclosing a snapshot and some information about my recently completed set of farm buildings. In a recent issue of *A.A.*, I noticed with great interest a picture of a barn similar to mine.

I believe the outstanding thing about this set of buildings, which replace our former ones lost by fire, is the cost. Barn, silo and henhouse totally cost less than \$6,000; the barn \$4,000; silo \$900, and henhouse \$700. All lumber including siding, ceiling, doors, trim, etc., was cut on the farm and sawed by a portable mill right on the very spot.

The barn started in the fall of 1946 was ready for cattle the first of May, 1947; the silo and henhouse were built in the summer of 1949. The only purchased lumber was a set of laminated rafters for the barn; the laying house rafters are homemade, being built all from one big elm tree.

The laying house was built entirely by me with a little exchanged labor

from neighbors. We paid \$1,000 to a local contractor and his crew for approximately three weeks' work on the barn. The silo, of course, cost about as much as anyone's, being a 12x36 monolithic poured concrete job built by a local silo concern.

The laying house is 28'x32' double deck with a capacity of 500 Leghorns and a feed room. The further end has a set of 8-foot doors so that the tractor and wagon can be backed in for cleaning. This is a warm, insulated house built complete for less than \$1.50 per bird! The barn is 36'x66' with steel stalls and stanchions and pens to accommodate 35 head of Ayrshire cattle, 22 milkers. It also contains in the rear corner a 10'x12' milkhouse.

My father being dead, the farm is run as a "mother-and-son partnership." Needless to say we are well satisfied and I am one young man well contented and optimistic about livestock and grassland farming in the Northeast. — Keith A. Tyler, Gouverneur, N. Y.

Freezing weather can't harm fresh spring grass ensiled in a MARIETTA. 4" thick Air-Cell staves with hollow-wall insulation keep out the cold. If you had erected an air-tight MARIETTA last spring, you would be feeding carotene-rich spring grass right now . . . and with much less trouble. Order your MARIETTA now. You earn an "early buyer's" discount and assure erection in time for spring grass. Mail this coupon today!

## Question Box

My kitchen sink edge is covered with aluminum, and when I stand against it my apron and dress front get black. How can this be prevented?

Liquid wax, applied periodically, is recommended. If clothing still becomes discolored from contact with the sink edge, you might try roughing up the aluminum with steel wool and then applying shellac.

\* \* \*

I have been unable to find a small leak in my roof. How can I locate it?

Examine the under side of the roof in bright daylight. When you find the spot where light shows through, put a piece of wire or a sliver of wood through the hole so it can be located from outside.

\* \* \*

I have a field of alfalfa which needs fertilizer. I would like to know what to apply.

Generally speaking, I feel that fertilizers like 0-14-14, 0-20-20, or, where borax is needed, a fertilizer such as 0-19-19 with borax, are preferable for alfalfa. There is no question, though, but what a little nitrogen in the fertilizer will get growth off to a little earlier start in the spring. Most experiments show insufficient increase in yield to pay for the nitrogen, and some experiments indicate a shortening of the life of the stand, particularly if the amount of potash applied in the fertilizer is not increased. Application of nitrogen seems to increase the need for potash. This is a general statement applying to soils that have been properly limed in this part of the country.

I have seen alfalfa grown on extremely light soils where some nitrogen was of definite benefit. I doubt if the amount in 3-12-6 would do much harm or very much good, although there is always the possibility that a little readily available nitrogen after a winter in which there had been some injury to plants, but not sufficient to kill them, might be of benefit.

For regular practice, though, I prefer the other fertilizers mentioned. There is no question but what the use of nitrogen will usually increase the amount of grass and weeds in the hay. If one is growing alfalfa on land that has not been adequately limed, he will usually see a good response from nitrogen. I have already seen it, though, on land that has been adequately limed.—George Serviss

\* \* \*

Is there any truth to the idea that aluminum or bronze paint on house radiators cuts down heat efficiency?

This is a well established fact. Flat wall paint is a better product to use on radiators.

—A. A.—

## WATCH FOR HIDDEN NAMES

Many of you will remember our "Hidden Names Contest" which we are again starting in this issue. Here's how it works: Scattered here and there in the advertising columns and standing alone without any reference to any advertising, you will find several names and addresses of AMERICAN AGRICULTURIST subscribers. Every subscriber whose name and address appears this way (the contest does not apply to names appearing either in advertisements or in editorial columns) will receive \$1.00 if he writes to AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y., saying he saw his name and address on page \_\_\_\_\_ of the \_\_\_\_\_ issue of AMERICAN AGRICULTURIST. To receive the \$1.00 this letter must be received within one week of the date of issue in which the name and address appear.

Margaret Allen, wife and partner of Roy Allen, Cortland, N. Y., says:

"We couldn't farm without KOW-KARE. We feed it regularly to our 15 fine grade cows; have it mixed with the feed at the mill. That's how we 'rope' the fussy eaters into line, and how they do respond to Kow-Kare! We have less trouble at Calving time, too. Our milk pick-up man tells us that although we have a small dairy we are producing more milk than larger dairies."

When feed costs are high there's double reason to sharpen cow appetites . . . tone up digestion to avoid breakdowns. The Allens know from experience that the slight cost of concentrated Kow-Kare is not an expense . . . but sensible insurance against sluggish conversion of feed and roughage.

Most cows are subjected to an unnatural drive for more and more yield. No wonder stamina breaks under such demands. Smart feeders add Kow-Kare to the feed. The Drugs, Iron, Iodine,

Cobalt, Calcium, Phosphorus and Vitamin D bring the sluggish digestions just what is needed to promote trouble-free milkings, fight feed waste.

## AT CALVING TIME

Here, of all times it pays to provide every cow due to freshen with the low-cost Kow-Kare build-up, before and after. Go through one season with this valuable aid to safe calving, and you will be a Kow-Kare convert and ardent enthusiast for life.

Your farm-supply dealer has Kow-Kare in three sizes, including the new bulk drum that spells amazing economy in large dairies.

FREE COW BOOK—Send today for your copy of helpful treatise on cow ills, "Care and Feeding of Dairy Cattle." Includes feed-mixing guidance fitted to your home-grown roughage.

## d-con will help you WIN the WAR ON RATS

GUARANTEED TO CLEAR YOUR PLACE OF RATS AND MICE COMPLETELY OR YOUR MONEY BACK . . . . .

Now, with amazing ease, you can clear your place of these disease carrying, property destroying rodents—and keep it clear, thanks to D-CON and its wonder working active ingredient WARFARIN. This scientifically developed product, discovered by the University of Wisconsin, is recommended by Federal Departments, county agents and the Farm Press of America. Its miracle, result producing action has been proven again and again in hundreds of supervised and controlled tests.

## SAFE, CLEAN, EASY TO HANDLE

D-CON is new, different. It outsmarts the rats because only cumulative doses prove deadly. Tests prove that rats return for successive daily feedings—they do not detect the source to avoid it—and a few days of feeding spell their doom.

## ENOUGH TO CLEAR YOUR PLACE OF RATS

Enough D-CON to clear the average farm of its entire rat population will be sent you in a plain wrapper with an ironclad money-back guarantee, for only \$2.98

RUSH YOUR ORDER TODAY  
d-con COMPANY

# SECURITY THROUGH COOPERATION

## The Outlook for Dairy Farmers Under a State of Total Mobilization

Our entire economy—industry, business, the farm, labor—is being mobilized under a declared state of emergency. All of us are going to feel the pinch for many months—possibly for years—to come.

We dairy farmers are eager to do our part. We proved our willingness and ability to feed this nation and others during World War II. However, the President in his tax message to Congress has singled out farmers as those whose "rate of progress cannot be continued in these perilous times."

### Our Fate Lies in Non-Farm Hands

Whether the President and his advisers feel that farmers have improved their condition more rapidly than industrialists, business men, or labor, we do not know. But we do know this: The men in Washington who are doing the planning and setting up the controls are not farmers; they are industrialists and business men.

Their integrity, their ability and their motives are beyond question. But they have little or no knowledge of farming. They don't know our materials needs or our manpower problems. To most of them, farm fertilizer means manure; they can't understand why we should need anything else. They have never operated a business where the best laid plans go haywire because it didn't rain, or it rained too much, or the frosts came too early or stayed too late, or the winds blew down buildings, and the snows clogged highways.

### They Live By the Clock; We Live Under Nature

In their every-day business life, everything runs by the clock. Everybody works a 5-day, 40 hour week. Overtime brings time-and-a-half or more. When that's not enough, you just hire an extra shift. Prices skyrocket, of course, so you slap on wage controls and price controls. Everywhere, that is, except on the farm. High food prices are bad politics, so on the farm you force prices down by government charity or price subsidies. That satisfies the consumers, but it makes the farmer a second-class citizen, a man without the right to full market-value for his produce, or the right to a free market.

### Not Yet, But Soon

Not all of this has happened yet, of course. But anyone with a 6-year memory knows that it is on the way. The dairy farmer has only one way to look for security. That is the way of cooperation with his fellow dairymen. Otherwise, his is a lone voice crying in the wilderness.

Twenty-six thousand members of the Dairymen's League, with the membership, the organization and the experience to make cooperative action effective, and particularly to make the dairy farmer's voice heard in Washington, invite you to join with them for effective dairy farm representation during the dangerous days ahead.

## DAIRYMEN'S LEAGUE

*Cooperative*

## A Visit With THE EDITOR

By E. R. EASTMAN

THE farm in Dryden Township where we live had been, until I bought it, in the Rhodes family for several generations since the town was settled. In the garret of our house—which apparently replaced the first one built by the settlers—we found a remarkable collection of old newspapers and magazines. Among these is a copy of the "Weekly Dryden News" published on November 26, 1863, right in the middle of the dark days of the Civil War.

You will recall that the Battle of Gettysburg, where Meade and his Union forces defeated and stopped Lee's attempted invasion of the North, was fought on July 1, 2 and 3 of this same year, 1863. On Thursday, November 19, just exactly a week before the above-mentioned newspaper was published, President Lincoln came to the Gettysburg battlefield to give the dedication speech for the national cemetery there. This old Dryden paper reported his speech in an obscure corner. In the introductory paragraph the editor said:

"The ceremony attending the dedication of the National Cemetery at Gettysburg last Thursday was witnessed by an immense concourse of citizens. The military and civic display was very fine. The following is the dedicatory speech of President Lincoln."

And here it is, just the way this old newspaper published it a week after the President made it. I think it particularly fitting to repeat this greatest speech in our language at a time when we celebrate Lincoln's birthday and are facing another great national crisis.

### Dedication of Gettysburg Cemetery

"Fourscore and seven years ago our fathers brought forth upon this continent a new nation, conceived in liberty, and dedicated to the proposition that all men are created equal. (Applause.) Now we are engaged in a great civil war, testing whether that nation or any nation so conceived and so dedicated can long endure. We are met on a great battlefield of war. We are met to dedicate a portion of it as the final resting-place of those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this. But in a larger sense we cannot dedicate, we cannot consecrate, 'the editor, of course, meant 'consecrate' we cannot hallow this ground. The brave men living and dead who struggled here have consecrated it far above our power to add or detract. (Applause.) The world will little note nor long remember what we say here, but it can never forget what they did here. (Applause.) It is for us, the living, rather to be dedicated here to the unfinished work that they have thus far so nobly carried on.' (Applause.) It is rather for us to be here dedicated to the great task remaining before us, that from these honored dead we take increased devotion to that cause for which they here gave the last full measure of devotion; that we here higher (highly) resolve that the dead shall not have died in vain (applause); that the nation shall, under God, have a new birth of freedom; and that governments of the people by the people, and for the people, shall not perish from the earth. (Long-continued applause.)"

— A.A. —

Machinery costs can be cut in several ways: lubricate tools properly; store under cover when not in use; keep them repaired; use them more hours per year, perhaps through custom work.

Winning pie bakers. Left to right: Patricia Krenzer, West Henrietta, first; Priscilla Dudley, Lyons, second; Dorothy Busby, Canandaigua, third; Cecelia Hoffman, Medina, fourth, and Orah Hicks, Piffard, fifth.

# Horace Putnam Heads Horticultural Society

THE man elected to head the New York State Horticultural Society for the coming year was Horace Putnam of Lyons. James Clarke of Milton is the new vice president and Dan Dalrymple was re-elected secretary and treasurer. Two directors, Gerard Maier of Lyons and Mr. Putnam, were re-elected, and one new director, Harold Hitchings of Nedrow, will replace Herman Kappel of Covert.

Policies of fruit growers on current problems were expressed by the following resolutions:

Supporting the Conference Board of Farm Organizations in its request for legislation allowing the Conservation Commissioner to declare open seasons on antlerless deer; for legislation to control artificial rainmaking; and for a new greenhouse and agricultural engineering building at Cornell.

Approving the work of Max Brunk and Mary Wood at Cornell relative to consumer preferences, and recommending that the information be made available to growers, packers and retailers.

Favoring a conservation payment to orchardists for removing marginal orchards.

Urging legislation allowing young children in the harvest fields under parental supervision so long as they do no work.

Favoring a permanent Horticultural Society committee to meet with the State Commissioner of Agriculture to study grading; also urging that 4 more grading inspectors be provided this year.

Much interest was shown in a discussion about the use of concentrated sprays. James Clark of Milton told how he varied the degree of concentration according to conditions, especially the weather.

Herman Kappel of Covert reported good results with concentrate sprays. Dr. A. B. Burrell of Cornell summar-

ized the discussion about as follows:

To date the same materials are used for standard sprays.

Concentrates vary from 2X to 8X with comparable decreases in gallons of spray per tree.

There is no run-off although a 2X (one part spray to 2 parts water) spray is on the borderline.

Assuming that sufficient spray was put on by the standard method, spraying with a concentrate can save material.

Winners in the F.F.A. speaking contest. From left to right: Carl Slocum of Wayne Central, first; Fay Andrews, Sodus, second; Wayne Hermon of Marion, third.

Some time can be saved, thus allowing the covering of more trees per hour.

A fine break-up of spray is essential except in hot weather, when most of the moisture may evaporate before the spray hits the trees.

Moderately open trees are desirable.

(Continued on Page 22)

F.F.A. boys from Sodus took home the lion's share of prizes, winning first in the disease identification and judging contests, and in exhibiting apples. Left to right, front row: Alfred Hermetet, Ronald Mills, John DeWispelaere, Ray DeCook. Back row: Ronnie Furter, Donald Van Waes, Don Johnson. North Rose took first in the apple grading contest but were not present at picture-taking time.

NEWS—EVERY HOUR—ON THE HOUR

# Plowing is Easier, Faster with a Massey-Harris No. 28

It's the big favorite with plowmen everywhere! The Massey-Harris No. 28 gives you a high-speed plow that does a *better* job of plowing faster . . . more economically.

From hitch to tail wheel, the No. 28 is built to meet today's plow requirements. Its modern design gives you a heavy-duty plow with an amazingly light draft. Streamlined, slow-rolling moldboards reduce drag, make it an easy-pulling plow that helps you make better use of your tractor's power . . . save fuel, cut plowing costs.

Its patented *Constant Clearance Lift* automatically raises the bottoms  $7\frac{1}{2}$  inches above the ground regardless of the depth you're plowing — assures you good clearance. Control levers are mounted in an easy-to-reach position. Sturdy, X-type frame bracing holds

the No. 28 in perfect alignment . . . protects it against the rough twists and strains of high-speed plowing. Long-wearing, *cone-type wheel bearings* are easily adjusted to give you true-running wheels for the life of the plow.

There's a No. 28 for your specific soil conditions . . . to fit your tractor. You have a choice of 2, 3, 4 or 5 bottoms — with 12, 14 or 16 inch shares. Have your dealer explain the exclusive Massey-Harris features and practical improvements on the No. 28 and you'll see why it's the plow preferred by champions!

For details on the complete line of Massey-Harris plows, tractors, combines and equipment, ask him for a copy of the Massey-Harris BUYERS GUIDE . . . or mail coupon below.

## Make it a Massey-Harris

1951 Gold Medal Winner

## HARRIS SEEDS

BEST MAIN CROP CORN PRODUCED TO DATE

1951 Gold Medal Winner. It has to be good to win a gold medal in the All-America competition, but it has all the qualities required of a champion:

- Close packed, very deep golden yellow kernels.
- Tender, sweet, fine flavored quality.
- Large ears with heavy husk tightly wrapped.
- Husky drought tolerant stalks with few suckers.
- Fresh, frozen or canned, it's "tops."

Only one of the many new vegetables and flowers beautifully illustrated and honestly described in our new catalog.

## From the Editor's MAILBAG

### DETERGENT DETERS FIRE

AS A SLIGHT return for the many good ideas you have developed for the benefit of the people, I am sending you one which you may try out and claim credit for if you are satisfied of its value.

On December 13 my sister-in-law, who lives in the next house, came to the door of her home and yelled "Fire!" She then proceeded to throw outdoors a small potburner oil stove which was ablaze, after which she proceeded to faint away. My wife and I rushed to the house on hearing the call of "Fire" and on entering the room where the stove had been we found a space about six feet square covered with kerosene which was blazing away in great shape. It seems the bottom of the stove had fallen apart in some way and let the kerosene out on the floor.

I had a fire extinguisher which had been purchased from the local fire company with extravagant recommendations as to its efficiency. I applied the contents of this fire extinguisher to the fire on the floor with practically no results of any kind.

EDITOR'S NOTE: This experience, of course, is not a reflection on this fire extinguisher because undoubtedly it was a type not intended to control fires of oil or gasoline.

My wife who was right behind me had in her hand a mop pail full of water in which she had dissolved a small quantity of Tide washing powder. She then took my place as fire fighter. She swished the pail of water on the roaring flames, and instantly the whole fire was out.

This extraordinary result astonished me, and I immediately went home, fixed up another pail of water with Tide powder dissolved in it, then placed a newspaper on the driveway, poured a pint of gasoline on the paper, touched it off, and when the flames got to roaring to their full power I dashed on the pail of water and the gasoline fire was out instantly. This made me think that possibly we had something which would be of value to people confronted with a dangerous fire and no equipment for

fighting it. I thought you might like to try out the idea and give the people the benefit of it if you felt it was worth while. — *Lincoln L. Watkins, Richford, N. Y.*

EDITOR'S NOTE: We are passing along this experience without having tried it, although we intend to do so at an early date. We would like to point out the possibility that any detergent washing powder would doubtless have the same effect. Why not try it out on a bonfire as Mr. Watkins did, being sure, of course, that the experiment is conducted in a safe place?

— A.A. —

### UNUSUAL HEN

I have a hen that changes her color every year. When this Rhode Island reached the age of one year, she lost all her red feathers. When she had finished molting, her feathers came back in a different color—black, red, and white. One year after she finished molting she was red all over except for 2 inches all around her neck. This fall she has turned black, white and red except her back, which is red with white on the end of some of the red feathers.

I have never seen anything like this before. She is a good layer even though she does change color every year. Perhaps some other reader has had a similar experience in his flock. I would appreciate knowing why this change takes place. — *Mrs. Mattie Simmons, Route 2, Englishtown, N. J.*

— A.A. —

### FOR SQUIRRELS

In reply to "squirrel trouble" I would say that we had the same trouble in a bungalow we rented for the summer. A box of camphor balls scattered over the space under the eaves made them leave in one day, and the landlord said they didn't even return the next winter.

My brothers who live on a farm use moth balls on the beams in the shed, back of shutters, and in the chicken houses where swallows want to build their nests. We use them around lettuce, etc. in the garden where rabbits delight to feed. — *Miss Elsie M. Snook, Hopewell, N. J.*

New York State winners of Esso Standard Oil Company's annual scholarships offered 4H Club members selected by Cornell University on academic achievement and club activities, pose with company representatives, W. H. St. Clair, New York Division Manager, and Dean Bedford, farm marketing. Left to right, are Ward D. MacMillen, Central Bridge; George E. Klein, Islip; David Hullett, Sinclairville; Mr. Bedford, Robert W. Snyder, Andover; Robert A. Howell, Bradford; Mr. St. Clair, Arthur R. Ives, Guilford; and Glenn MacMillen, Central Bridge.

**Herbert King**  
1873 - 1951

HERBERT KING of Trumansburg, N. Y., died January 16 at the home farm which has been in the King family since 1795. Mr. King had a host of friends, not only in the Northeast but in many other states.

In 1921 he was made a New York State Master Farmer by AMERICAN AGRICULTURIST. He was president of the New York State Farm Bureau Federation from 1934 to 1940, and during those same years he was a director of the American Farm Bureau Federation. In the past he had served as president of the Seneca County Farm Bureau, vice president of the New York State Horticultural Society and had been a Grange member since 1904.

Mr. King graduated from Cornell University in 1900 and went from there to the home farm, where he grew excellent fruit, especially sweet cherries. Farming, to him, was a way of life. He was kindly and always ready to give a friend a lift. His wise counsel will be missed by his many friends.

— A. A. —

**EXPENSES THEN AND NOW**

THE table below is worth considerable study. It shows the results of 2 surveys on 14 Tompkins County, New York farms—one taken in 1907 and one taken in 1947.

On these farms today, the operators are in trouble when their incomes decline 25 per cent without a corresponding decline in expenses. In 1907, income could have been reduced one-half and it would still have been greater than expenses.

Today the capital required to operate their businesses is almost four times as great as it was in 1907. If they lost the full amount of their expenses, they could lose their total capital in 2½ years. Back in 1907 this would have required 12 years.

So a farmer today has to have dollars to operate his business, to buy the things going into production, to buy groceries and things for the home, to pay labor, interest, taxes, etc., If a farmer loses out today, he loses his farm and his other possessions and he is out of business. Many times it is difficult if not impossible to start over because getting started today usually requires a considerable amount of capital and a large amount of credit to finance a commercialized farm business.

	Averages per farm	
	1907	1947
Acres	114	174
Cows	12	23
Capital		
Real Estate	\$4,614	\$10,486
Other	1,832	12,022

**WATER PLUS FOOD FOR POTATOES**

Recent tests in which varying amounts of irrigation water were applied to potatoes in different row widths and under two rates of fertilization showed some interesting responses in Long Island experiments.

Water Source	(1 ton 5-10-10)		
	12" Row Width	18" Row Width	36" Row Width
Rain only	323 bu.	393 bu.	291 bu.
Rain plus 2.8"	372	351	333
Rain plus 3.7"	386	382	354

Water Source	(2 tons 5-10-10)		
	12" Row Width	18" Row Width	36" Row Width
Rain only	437 bu.	430 bu.	344 bu.
Rain plus 2.8"	433	457	383
Rain plus 3.7"	478	450	355

In the irrigation test plots at the Long Island Vegetable Research Farm the increase in yield for the average of the eight preceding years was 57 bushels per acre.

**NEW WILT-RESISTANT IROQUOIS MELON**

**HARRIS SEEDS**

Bring you IROQUOIS THE MELON WITH A COLLEGE DEGREE

The professors were working toward a melon with resistance to fusarium wilt. What their "good breeding" accomplished was a medium-sized fruit with thick, smooth, fine-grained deep orange flesh of a superb sweet flavor. The rind is thin, but tough so it stands up well in handling and shipping, and the vines are resistant to fusarium wilt.

Top quality and performance are bred into all vegetables and flowers offered in our Catalog.

# How We Built a Picnic Table

**H**OW many of you have been intending to build a picnic table but have never gotten around to it? I was, and eventually did. We like it so much that I am going to tell you how I made it.

I examined several picnic tables, took some measurements, and then drew a set of plans and made a bill of materials. A local lumber dealer sawed the lumber to my plan, including the end pieces for table and benches.

The table is made of fir which, I am told, will last as long as we will need one. I stained it with cuprinol,

a second table together much faster than I did the first, but I am passing along some of my experiences to you because the directions I am giving include a couple of wrinkles I learned the hard way.

First, I bolted the legs of table and benches to the cross supports, then joined the two ends (legs) together with 5" lag screws. Next I screwed the cross pieces to the tops of the table and the benches. If I find that the screws do not hold securely, I will replace them with bolts, but I started the screws from the underside so the top of the table and benches have no bolts or screws showing. The 2x4's holding the legs of the benches together are 6" longer than the one holding the table legs together. In this way the benches can be put close to the table and the legs do not interfere.

The top is made of two 12" boards and one 6". There is 1/4" between boards to allow for quick drying after a rain.

Considering what a good picnic table costs and how sturdy this one is, I think its cost was very reasonable. If you build one like it, let me know how you make out.

\* \* \*

## Forsythia

In areas where the winters are not too severe, forsythia is one of the easiest flowering shrubs to grow and one of the first to bloom in the spring. Forsythia will stand about the same degree of cold as peaches; therefore, if peaches cannot be grown in your area there is no use of setting out forsythia.

There is another advantage to this shrub, namely that you can cut and bring branches in the house and get some very nice yellow blooms early in the spring. In fact, we had forsythia in the house and beginning to show yellow on January 1 this year. We cut the branches (a little trimming doesn't do any harm) and put them down cellar in a pail of water, and we bring them up from time to time so we have some in bloom practically all spring.

\* \* \*

## Pruning

The other day when the temperature was mild I did a little apple tree pruning. If a tree is started right when it is young, it is much easier to decide what branches to cut out. However, anyone with a reasonable amount of ability can do a fairly good job of pruning if he will follow 2 or 3 principles. The first one is to take out a considerable number of small branches rather than a few big ones. In doing this you thin out the tree on the outside where most of the fruit is borne. In the second place, remove one branch where two are interfering. Third, keep trees reasonably low by heading back the top branches to a side branch. In a general way these same rules will apply to other fruit trees.—H. L. Cosline

One of the benches turned bottom side up to show details of construction.

which is also a preservative. I am told that there is so much pitch in this wood that it cannot be painted now, but that it can be after it weathers for a couple of years.

The bill of materials and the pictures containing dimensions will, I think, give you the information you need to build one like it if you wish to.

### Bill of Materials

- 2 pieces — 2" x 12" x 6'
- 1 piece — 2" x 6" x 6'
- 2 pieces — 2" x 4" x 5'2"
- 1 piece — 2" x 4" x 4'8"
- 2 pieces — 2" x 4" x 2'4"
- 4 pieces — 2" x 4" x 10"
- 6—5" lag screws
- 12—6" carriage bolts
- 20—2 1/4" wood screws

The cost was \$15 for lumber and \$1.25 for bolts and screws. Cutting to dimension was \$5, which I thought was high. Maybe you can get a better deal. The cuprinol I had on hand and I don't know exactly what it cost.

As is often the case, I could put

All lumber is 2" thick; benches and table are 6' long. They are sturdy and practical. The cost could be cut by using old lumber, but in that case I suggest you paint thoroughly, to lessen decay, before you put table and benches together.

## FARMING IS NOT A RISKY BUSINESS

Farming need not be risky, particularly from the crop angle, if you select your seed with care and take advantage of every "break" nature gives you.

To help you reduce the possibilities of crop failure this year, we have prepared a special booklet.

This booklet tells you up-to-the-minute facts about Ladino, Buffalo and Ranger Alfalfas, Cumberland and Kenland Clovers, Clinton "11" Oats, Birdsfoot Trefoil and other new farm seeds. It also gives you valuable tips on fertilizing, grass silage, stock feeding, weeds, pasture and hay formulas, and many other tested methods that can put more money in your pockets.

Take the first step toward bigger yields of better crops and bigger profits. Mail the coupon below for FREE new booklet that helps you take the risk out of farming.

A. H. Hoffman, Inc., Box 42  
Landisville (Lancaster County) Pa.

## SPRING LAWN CHORES

Maintaining a good lawn requires some work and a little money but it is worth it. One of the early spring chores is adding about 20 pounds of a 5-10-5 fertilizer to each 1,000 square feet.

Contrary to a generally accepted idea, lime doesn't cure mossy spots. Moss grows because there is too little fertility to grow grass. Rake off the moss, add fertilizer, loosen the soil with a rake and reseed it.

If you have bare spots where water stands for a considerable time after each rain, it is probable that tile draining is the only sure cure. Four-inch tile from 2 to 2½ feet deep in lines from 15 to 25 feet apart will do the trick.

A common practice that hurts lawns is cutting the grass too short. Adjust the mower so it will cut at a height of 1½ inches.

A good growth of grass is one of the best weed control measures. However you can use 2,4-D to kill dandelions and plantain. Follow manufacturer's directions carefully, choose a day when there is no wind, and avoid drift on to your choice shrubs.

— A. A. —

## SHRUBS

The next time the family is out for a Sunday afternoon drive, suggest that a careful look be taken at the shrubbery around the houses you pass. If a planting pleases the majority, see if you can tell why. If it seems unsatisfactory, figure out the reasons.

As a starter, here are three common mistakes:

1. Failing to look ahead and see how shrubs will look when mature. Often tall growing trees are set out under windows.
2. Setting a straight row of one variety of shrub around the house.
3. Putting shrubs, or flower beds, right in the center of the lawn. A better way is to make plantings at the edges and corners.

When you get home, give your own landscaping a critical eye. Spring is the time to correct mistakes, add more shrubs, or to make a start toward landscaping if nothing has been done in the past.

— A. A. —

## GORGEOUS GLADS

Our aim with glads is to have one good bouquet rather constantly over as long a period as possible. We find that this can be done by putting out the first corns about May 10 in our area. A good rule is to set them when native trees begin to unfold their leaves. Planting can be continued until around the middle of June.

We found that it is unnecessary to make more than 2 plantings because a number of factors vary the time of blooming. Among these factors are the depth to which corns are planted, the size, and the conditions under which they were stored during the winter. Large corns bloom earlier than small ones.

One of our difficulties last summer was that rabbits chewed the edges of the leaves. We wouldn't have believed it if we hadn't seen it. We are taking steps to cut down our rabbit population which is heavy because of surrounding wild land, and then we plan to use a spray as a rabbit repellent.

— A. A. —

## SCARECROW

A British fireworks firm has developed a scarecrow that might find a market here. As described, it is a dummy to which is tied a length of rope or fuse containing 24 firecrackers. The fuse is lighted, smolders, and sets off 3 firecrackers an hour for 8 hours. As each firecracker explodes, arms spring out from the dummy and then fall against its body with a clatter.

Maybe crows would figure it out quickly. Nevertheless, the possibilities seem interesting.

# Only NATURAL CHILEAN NITRATE offers you all these 10 Vital Advantages

1. **Natural.** Chilean Nitrate is the only natural nitrate in the world.
2. **Nitrate Nitrogen.** The nitrogen is 100 per cent nitrate.
3. **Sodium.** Chilean Nitrate contains 26 per cent sodium, equivalent to 35 per cent sodium oxide. Sodium is essential to maximum yields. It substitutes for potassium, where lacking, and makes soil phosphate more available. It also improves the vigor and feeding qualities of forage crops.
4. **Iodine.** Chilean Nitrate contains iodine to help meet the needs of plants, animals, and human beings.
5. **Other Plant Food Elements.** Chilean Nitrate contains natural traces of many other elements that contribute to strong, healthy plant growth.
6. **Ideal Condition.** Chilean Nitrate comes in free-flowing pellets—easy to handle and to apply.
7. **Quick-Acting.** Chilean Nitrate is completely available.
8. **Anti-Acid.** Chilean Nitrate helps keep the soil sweet.
9. **Time-Tested.** Chilean Nitrate has been proved by more than 100 years of research and farming.
10. **Doubly Profitable—Economic.** Chilean Nitrate improves the quality of crops as well as the yield, making it doubly profitable and economical.

Specify Natural Chilean Nitrate of Soda by name when you order your fertilizer.

## DAWNWOOD FARMS

## HIGHLIGHTS At The Pennsylvania Farm Show

**A**N ALL-TIME record was set at the 35th Pennsylvania Farm Show. Attendance for the 5 days and 4 nights was 591,000, which was 11,000 higher than the previous record set in 1949.

Here are a few show highlights:

The first annual sheep shearing contest was won by Lewis Nicholas, Bangor, Northampton Co.; second was James Shearer, Indiana, Indiana Co.; third, Carlyle Dick, Clymer, Indiana Co.

A two-man team from DuBois won the State Championship farmer-lumberman log sawing title. Clarence Spicher and Arthur Yale ripped through a 20-inch oak log in 49.2 seconds. Second place went to Robert Warner, Sr., and William Wildrick of Pocono Lake, Monroe Co.

The State horseshoe pitching title went to James Fulton, Carlisle, Cumberland Co. Runner-up was J. W. Mayes, Calvin, Huntingdon Co.

The heavyweight horse pulling contest was halted when the machine broke. The lightweight contest was previously won by a team owned by Ray Kessler, Millville, Columbia Co. Second place went to a team owned by Paul Brewer, Coudersport, Potter Co.

### Crop Contest Winners

The title of Corn King was bestowed on Willard Schwager, Lansdale, Montgomery Co., who grew 137.4 bushels per acre on a 12-acre field. Second place went to M. Dice Statler, Chambersburg, Franklin Co.

Topping the 10-ton tomato winners was Robert Campbell, Danville, Northumberland Co. William Arbogast, Sunbury, Northumberland Co., took first for the highest quality.

Selected for special honors by the Pennsylvania Potato Growers were E. O. Mastin, Quakertown, Montgomery Co., and Harry and Dean Freidline, Boswell, Somerset Co. With two surface irrigations, Mastin grew a state record of 937.5 bushels of Katahdins on an acre of land—a State record. The Freidline brothers, without irrigation, dug 837.5 bushels from an acre.

Six Pennsylvania farmers were made Master Farmers by the Pennsylvania Farmer. They were: Alexander Claypoole, Worthington, Armstrong Co.; John N. Griffith, Ebensburg, Cambria Co.; Isaac Gross, Plumsteadville, Bucks Co.; Irvin Macafee, Milan, Bradford Co.; Abner Risser, Bainbridge, Lancaster Co.; and Edwin B. Wallis, Liverpool, Perry Co.

### 4-H Winners

Thirteen-year-old Jean Graybill, Manheim, Lancaster Co., won 3 grand champion awards with her 4-H Angus baby beef, her pen of Shropshire lambs, and the open class fat cattle grand championship.

Paul Miller, Manheim, Lancaster Co., won first as a baby beef showman. Lucille Graybill of Manheim won second, and Paul Fehnel, Nazareth, won third. Best Hereford showman was Alan Bower, Blain, Perry Co.; Harold Rohrer, Lancaster, placed second, and Walter Augsbarger, Reinholds, third. Best Shorthorn showman was Ira Espenshade, Elizabethtown, Dauphin Co. second place went to Jay Espenshade, and third to Pauline Espenshade, both of Elizabethtown.

The Shorthorn breed championship in 4-H Club baby beef went to Frances Buckwalter, Lititz, Lancaster Co.; Ira Espenshade, Elizabethtown, Dauphin Co., showed the reserve champion.

A 4-H team from Clearfield County made up of Jacob McGree, Kerrmoor, and Robert Straw and Richard Straw, LaJose, took first prize in the 4-H potato grading and identification contest. Second place went to a Lehigh County

team: Henry Gruber, New Tripoli; Hubert Sell, Schnecksville; and Donald Harter, Slatington.

### FFA Winners

Fifteen-year-old John Switzer, FFA student at Clarion-Limestone high school, Clarion, won the title of most efficient corn grower for young growers; second place went to J. W. Barber of Butler County; third to Dale McMunn of Clarion, and fourth to Jerry Kahle of Clarion-Limestone high school.

In an FFA window display exhibit, the Trinity Joint High School of Washington County took first place. The display featured "Controlled Lighting." Second place went to Montrose-Bridgewater Joint High School, Montrose, Susquehanna Co.

A vocational homemaking demonstration was won by Trinity Joint High School of Washington County, Pa., with 22 teams competing. They featured "New Lamps from Old." Second place went to Liberty Joint High School, Liberty, Allegheny Co. Third place went to Pymatuning Joint High School, Jamestown, Mercer Co., Pa.

### Officers

The following are presidents elected by various state-wide farm groups:

Pennsylvania Milking Shorthorn Society: Edison M. Hay, Meyersdale, Somerset Co.

Pennsylvania Ayrshire Breeders Association: Karl Neibecker, Yardley, Buck Co.

Pennsylvania Guernsey Breeders Ass'n.: Loyal B. Spang, Butler, Butler Co.

Pennsylvania Dairymen's Ass'n.: J. Lewis Williams, Uniontown, Fayette Co.

Pennsylvania Holstein Association: Earl Moore, Greencastle, Franklin Co.

Pennsylvania Duroc-Jersey Swine Breeders Association: J. R. Hartle, Bellefonte, Centre Co.

Pennsylvania Yorkshire Swine Breeders Association: F. E. Busler, Peach Bottom, Lancaster Co.

Pennsylvania Chester White Swine Breeders Association: J. Harold Little, Hanover, York Co.

Pennsylvania Cooperative Swine Breeders: Dale M. Ritter, Harrisburg.

Pennsylvania Poland China Swine Breeders Association: C. A. Woodward, Port Royal, Juniata Co.

Pennsylvania Hampshire Swine Breeders Association: D. Lee Mohny, Stoneboro, Mercer Co.

Pennsylvania Spotted Poland China Breeders Association: William M. Kauffman, York.

Pennsylvania Berkshire Breeders Association: Perry Cooper, Reynoldsville.

Pennsylvania Crop Improvement Association: Henry Nixon of Manheim.

Pennsylvania Christmas Tree Growers Association: Murray C. Stewart, Homer City, Indiana Co.

Pennsylvania Vegetable Growers Association: Fred C. Brehm, Dilltown, Indiana Co.

Pennsylvania Nut Growers Association: R. P. Allaman, Harrisburg.

Pennsylvania Young Farmers Ass'n.: William A. Schirra, Herman, Butler Co.

Pennsylvania State Beekeepers Ass'n.: Merle P. Fisher, Granville, Mifflin Co.

Pennsylvania Horse and Mule Association: John P. Bloom, Ebensburg, Cambria Co.

— A. A. —

## NEW ABERDEEN-ANGUS ASSOCIATION FORMED

Recently a group of breeders in Westchester and Putnam Counties in New York organized the Westchester County Aberdeen-Angus Breeders' Association. Regular meetings are planned for luncheons and discussions, and an auction sale once a year.

The following breeders are the founders of the new association: Cochran Farm, North Salem, N. Y.; Echo Hill Farm, Ridgefield, Conn.; Fieldwood Farm, Ossining, N. Y.; Hill Farm, Chappaqua, N. Y.; Meadow Lane Farm, North Salem, N. Y.; Mr. Edward F. O'Boyle, Katonah, N. Y.; Old Bailey Manor, Brewster, N. Y.; Redshield Farm, Brewster, N. Y.; Rolling Hill Farms, Brewster, N. Y.; Seven Lakes Farm, Yorktown Heights, N. Y.

Grover Guernsey, right, joined with other Holstein men in appreciating the humor of a man with his name being elected president of the New York Holstein-Friesian Association. With him above are Leon A. Piquet, retiring president, left, and E. J. Keane of Syracuse, toastmaster at the annual banquet.

## Guernsey Heads Holstein Club

**M**ORE than 300 delegates and guests attended the 31st annual meeting of the New York Holstein-Friesian Association at Elmira, January 15 and 16, and elected Grover C. Guernsey of Schoharie, N. Y., as president of the organization for the coming year.

Among the resolutions adopted by the representatives of 29 county Holstein-Friesian clubs in New York State were the following:

1. Urged every dairyman to support the "Milk for Health" program.
2. Urged all farm, church and other organizations to offer and serve milk as a choice at all meals served to members and to the public.
3. Reiterated opposition to the sale of oleo in imitation of butter.
4. Commended draft boards for the consideration they have given farm help, and urged adoption of deferment of bona fide, skilled farm labor so that production could be continued at a maximum.
5. Requested the War Mobilization Board to direct farm machinery manufacturers to give priority to production of parts and to help farmers keep all machinery running; and to direct their farm machinery distributors and local dealers to keep adequate inventories of stock to handle the increased demands of the regular customers without undue delay.
6. Asked the New York State Legislature to appropriate sufficient funds to prepare and publish in one monthly bulletin a report of the utilization of the various classes of milk on all markets in the state.

Other officers elected were: Grant Langdon of Copake, N. Y., First Vice President; David J. Roberts of Sauquoit, N. Y., Second Vice President; Frank P. Wavle of McGraw, N. Y., who has worked as treasurer of the organization for the past 25 years, was commended at the meeting and was re-elected to succeed himself, as were Secretary W. D. Brown of Ithaca and Assistant Field Man A. T. Perseus of Ithaca.

New directors elected for 3-year terms on the 29-man board representing all the county clubs were: Clark Russell, Cattaraugus Club; Joseph Genovesi, Capital District Club; Peter Sinclair, Livingston Club; George Ames, St. Lawrence Club; Edward Davis, Wayne-Ontario Club; Vernon Long, Western New York Club; Fenton H. Wager, Yates Club; Ben Mitchell, Jefferson Club; William T. Jones, Madison Club; and John Freeman, Lewis Club.

Members receiving the Progressive Breeders' Registry Plaques were: Gerov Brothers, Washingtonville, N. Y.; Daniel Grant, Afton, N. Y.; Roy H. Studer, Lyons, N. Y.; Frank Yaeger, Webster, N. Y.; Howard L. Page, New Berlin, N. Y.; Ernest C. Strobeck,

Macedon, N. Y.; David J. Roberts, Sauquoit, N. Y.; and George H. Comings, Bainbridge, N. Y.

Those presented twenty-five year Membership Certificates, were Olcott Farms, and Milton A. Roy, Chemung County Club; E. P. Smith, Chenango County Club; Lawrence J. Lonergan, and Frank P. Wavle, Cortland County Club; Paul Smith, Finger Lakes Club; Clarence Collins, Franklin County Club; Orrin F. Ross, Lewis County Club; Hugh G. Humphreys & Sons, and Francis M. Jones, Oneida County Club; Leonard S. Chase, Frank N. Decker, and J. G. Horner, Onondaga Co. Club.

Nineteen club members were presented certificates of recognition of animals in their herds for producing 100,000 pounds or more of milk. They were: LaMotte Breese, Elmira; Walter W. Burtis, Cortland; Carl V. Clarke, Andover; Arling Cobb, Whitesville (2); Cornell University (4); G. S. Cowles & Son, Ashville; C. E. and R. H. Fisher, Cazenovia; Homestead Farms, Inc., Stormville; Arthur D. Hoose, Fishkill; and Mrs. J. M. Huff & Sons, Honeoye; L. W. Irish, Valatie (3); Thomas N. Nagle, Webster; Ralph E. Ogden, Mountainville (2); Cortez J. Pells, Hillsdale (2); The late James L. Sears, Baldwinsville; Ceylon R. Snider, Fillmore; The H. R. Wait Co., Auburn (2); J. Blake Winter, Middletown (3); and Frank Yaeger & Sons, Webster.

During the annual banquet which closed the 1950 program, President L. A. Piquet of East Aurora, N. Y., presented the Ward W. Stevens Holstein Scholarship Winners, Lawrence W. Specht of St. Lawrence County and Francis Allen Trerise of Sullivan County; and Tom Wiley, 4-H Extension Specialist, presented 4-H Champions Joseph Fisher of Canastota, and Jeanne Pendergast of Skaneateles.

— A. A. —

## MOTORIZED BRUSHES WASH SAP BUCKETS

(Continued from Page 10)  
springs to scrub the bottom and will handle up to 12 inches diameter.

In operation, Darrah slides his bucket up over the brushes, pushes his foot-lever to make them fit the bucket, holds it there a few seconds, and the job's done. The tank is filled with water as hot as hands will stand. Darrah says soap will help clean, and also reduce splashing. He also uses a rinsing tub.

How fast will his rig work? "A group of three or four men can easily wash from 500 to 1,000 buckets an hour," says Darrah.—William Gilman

use the

# World's First ANTI-RUST GASOLINE

**It stops rust that can stop your tractor, truck or car**

Magnified carburetor jet, showing how speck of rust can clog passage. This causes stalling and sputtering.

Yes, gasoline tanks rust—because of moisture condensation. And rust specks can clog fuel lines, carburetor jets—causing stalling and costing you money in wasted gasoline and repairs.

Now Sinclair enables you to stop the formation of rust and corrosion... with the world's first anti-rust gasoline. It contains Sinclair's new rust inhibitor, RD-119, which forms an invisible, rust-proof film throughout your fuel system.

Get full power, *plus* new anti-rust protection at no extra cost. Phone your Sinclair Representative today for —

SEIDELTON FARMS, Washingtonville, Pa.

## HOW TO RAISE CLEAN PULLETS IN 1951

(Continued from Page 9)

before it gets to the hens. When you take care of the chicks, you should either have one person take care of the chicks and another take care of the old birds, or, if you do it all yourself, you should always go out and take care of the chicks first and then take care of the old birds.

If you decide to build a permanent brooder house where you have a furnace and all the new wrinkles, you should by all means build this quite a ways from the old hens. If you can, build it on a separate farm. You will find that the difference in production and livability from the resulting pullets will pay for the brooder house in a hurry, as compared to the pullets you would raise if you put this building right near to the old birds.

### Second Hand Houses

If you have been raising your chicks in the same building with old hens and decide that you want to raise them in brooder houses, but do not feel that you can afford to build brooder houses because it runs into too much money, you can put an ad in the local paper and say that you want to buy second-hand brooder houses. Usually you can pick them up for anywhere from \$50 to \$150 and brooder houses of this type—usually 12' by 12' or 10' by 12' houses—can be bought quite cheaply. There are always folks quitting the chicken business or needing ready cash, and the chicks will do just as well in an old house that is tight and somewhere near decent as they will in a brand new house.

Another alternative is to hunt around the countryside and find some good 4-H boy or girl or some broiler raiser who has no old birds on the farm, and get him to raise your chicks from day-old up to range age or to laying age. The best way to do this is agree to pay the man by the pound for the birds rather than the piece, because if you pay by the pound he will do a better job of raising them. Sometimes you can hunt around the neighborhood and find a poultry farm that is not being used, and rent it for raising your young birds.

In all these houses, whether you are getting someone else to raise the chicks or renting a building or buying some old buildings, you want to be sure that they are absolutely 100% rat-tight, because one rat can get away with 75 or 100 chicks in a night and figure he has done just a nice night's work.

### Isolation Helps

Chicks evidently pick up various diseases, such as coccidiosis and leukosis, during the first few weeks of their lives, and if you can raise them absolutely away from old birds for eight weeks it will be a big help. If you can raise them away from old birds until they are ready to lay, it is still better.

The good breeders of the country are not raising their pullets under these clean conditions. They are raising at least half of their pedigreed pullets under heavy exposure and learning from their records which birds resist these conditions. They then continue to breed from the birds that resist these rough conditions. Breeders who are raising all of their pullets under the clean conditions recommended here are not the breeders that you should purchase your chicks from. You should purchase them from the breeders who are trying to breed for disease resistance. Then when these birds that have been bred for disease resistance are raised under clean conditions, you will really have some pullets that will make you money in 1951.

— A. A. —

A tractor engine covered with dirt and dust will heat up more than a clean one.

# BABCOCK'S HEALTHY CHICKS

## Make Great Layers

At the 1950 Storrs Connecticut Egg Laying Test, our White Leghorns won first, all breeds. For the fourth time we won high leghorn pen at the Georgia Test. In 1949 we set an all-time high record, winning Poultry Tribune Trophy. In 1950 we were second. High spots in our past records are as follows:

These Babcock Leghorns set a new World Record for all breeds by laying 4,057 eggs for 4,336.25 points at The Western New York Egg Laying Test in 1944-45.

Winners of the Ninth Official California Egg Laying Test held in 1949. These Babcock White Leghorns showed a net income of \$8.10 per hen, laying 294.7 eggs per bird and with 100% livability—the highest net income of any California Test year.

Highest White Leghorn pen in the Nation for all United States Tests, 1946-47. Won at Western New York Egg Laying Test.

High White Leghorn pen, all United States Egg Laying Tests for 1941-42. The record: 3,839 eggs and 3,940.4 points in 51 weeks was made at the Pennsylvania Official Egg Laying Test.

# DOWN THE

By J. F. (Doc) ROBERTS

Honorable Senators and Representatives  
Washington, D. C.

Dear Sirs:

In the course of my everyday work I come in contact with a good many farmers who have no other source of income than farming. I thought you might be interested in their realistic and down-to-earth expressions of what they are thinking, and perhaps these expressions can be of value to you in the decisions you must make:

1. Farmers are not impressed by this "state of emergency" or "scare" talk. They still think that, with good leadership, America can take care of herself. They know that strength is only gained and kept by hard work, good judgment and a willing people. All the rest of the stuff they hear is only aggravating and discouraging.

2. Farmers are not isolationists, yet they feel that bad judgment in this Korean affair has done more harm to the people of South Korea than if we had stayed out, and they abhor a casualty list of 40,000 of their boys. They also fear another horrible fiasco such as Korea, and all this "scare" talk does not reassure them.

3. They are for the United Nations 100 per cent, but they feel they will again be disillusioned unless the U. N. stops this idle talk and does something now to help the Korean, Chinese, and Formosa situation. They really hate to give up on the U. N., but they cannot go along with it—unless—

4. You see, all these farmers have been through one or two wars, and have seen the wars won and the peace lost. Now they are cautious (perhaps overly cautious) about entangling alliances—especially in Europe. They seem to feel that until Europe takes a different attitude towards us and portrays a willingness to help itself our strength should be concentrated here and not over there. They feel that under no conditions should we be drawn into any other "police actions" or "38 parallels."

5. At home, farmers are just beginning to recover from subsidies, controls, and food bungling legislation of the last war. They are saying that people have food in abundance; figures prove that they are not paying a larger percentage of their increased earnings for food than during pre-war days. They remember shortages, black markets, and the moral degradation of a scramble for advantage in rationing. Food is a necessity and should not be a political football. They are saying that surely our legislators know that when food enters politics, the gravy train starts. The average farmer knows he can well take care of himself when these legislative controls produce shortages. Thank him for the stand he is taking against controls.

6. Food shortages should be the most

## START WITH THE BEST

Get a copy of our new directory which lists New York State breeders and what pigs they have for sale at this time.

New York State Swine Association  
Frank L. Wiley, Sec. Treas. Victor, N. Y.

## FRUIT

NOW IS THE SEASON when Florida citrus is at its best. Bushel of assorted fruit prepaid in East for \$5.75. Half bushel \$3.75. Temple oranges (January and February only) \$6.50 per bushel. Spell's Citrus, Deland, Florida.

GROWER-SHIPPER tree ripened fruit. Oranges \$2.50 bu. Grapefruit \$2.50 bu. Check or money order. Stacy C. Tallman, 1256 Bay Ave., Clearwater, Florida.

BUSHEL delicious temples \$5.75. Grapefruit \$3.95. Oranges \$4.35. Prepaid. James Kimber, Winter Park, Florida.

feared setback to our defense effort. The farmer now is ready and willing to go all out for production. Control legislation, or threats of controls, can cut this production in half. The farmer must operate on a future market. This he cannot afford to do on an all-out basis when threatened legislation promises setbacks, controls, and rationing. He asks that you remember the early and middle 40's; surely they are still clear in your mind.

EDITOR'S NOTE: Farmers are also wondering whether or not their sons and hired men will be drafted and, if they are, who will raise the food we will need.

7. The farmer is really worried about taxes, and fears over taxation more than inflation. In his thinking, he reverses the usual legislative thinking. Farmers think that increased taxes produce inflation because they increase money for government to spend. Legislators seem to think increased taxes reduce money available to the people and therefore reduce inflation. Think it over Mr. Legislator! I believe you will agree with the farmer that increased spending of more of the people's money by government is really the cause of inflation. In other words, if you cut down taxes you cut down government spending of tax money and thus cut down inflation. Further, if you over-spend the tax budget, every penny of that expenditure is inflationary.

8. In conclusion, Mr. Legislator, farmers are worried about their boys on foreign soils (both present and future) and they are looking to you to go slowly—very slowly. Farmers are for a strong, united country and they are willing to sacrifice everything for it. They doubt "scare" propaganda and want true facts. They want a strong nation within first. They feel that economic bungling within is as great a danger as any danger outside. They are as sick of power grabbers within (bureaucrats and commissars) as they are with power grabbers outside. They are hoping you will wash, iron, mend and put away your linen before you again start washing other peoples'. Farmers are praying for good, sound leadership.

Yours sincerely,  
Doc. Roberts

—A.A.—

## BOB CHILD TELLS "RURAL RADIO" STORY

THE appointment of Robert B. Child as field secretary for the Rural Radio Foundation has been announced by Harold Stanley, Skaneateles, the Foundation's president. The Foundation, which owns the 13-station Rural Radio FM Network, is made up of representatives from the ten major farm organizations in New York State.

Stanley said that Child would serve the Foundation by "working directly with northeastern farm people in taking the story of the first farmer owned radio network to them and gathering their ideas and suggestions."

The Rural Radio Network has FM stations at Niagara Falls, Weathersfield, Olean, Bristol Center, Ithaca, DeRuyter, Watertown, Massena, Utica-Rome, Cherry Valley, Troy, Poughkeepsie and Scranton.

Most of the northeastern farm radio audience is already familiar with some of Child's work. Originally from Malone, N. Y., he is a son of the late John A. Child, an AMERICAN AGRICULTURIST "Master Farmer." He graduated from the College of Agriculture at Cornell University, and from 1939 until 1942 was an Extension Agronomist, working with farmers throughout the state. While doing soils and crops work, he wrote a column, "Forage Facts," for AMERICAN AGRICULTURIST. In 1942 he was made supervisor of farm radio programs for Station WGY, Schenectady. When the Rural Radio Network started broadcasting in June 1948, he became its director of service programs.

# Protect the PROFIT POINT

To safeguard against loss of quarters, treat all teat injuries promptly.

Dr. Naylor Dilators carry antiseptics into teat canal to help combat infection and reduce inflammation. They furnish gentle, non-irritating support to injured lining and promote normal relaxation at end of teat by sustained antiseptic contact directly at site of trouble.

## "Windgall? Use ABSORBINE"

says Gustave Troutman, of Milton, N.Y.

"I've been a farmer for 40 years and all that time I've used Absorbine for my horses. I've found it quickly relieves strain and soreness from windgall."

Yes, farmers know there's nothing like Absorbine for helping to relieve lameness due to windgall, sore shoulder, fresh bog spavin and similar congestive troubles. Not a "cure-all," Absorbine is a time-proved help . . . used by many leading veterinarians, too, for helping to relieve puffs, strains and bruises.

A stand-by for 50 years, Absorbine will not blister or remove hair. Only \$2.50 for a long-lasting bottle at all druggists.

W. F. Young, Inc., Springfield, Mass.

## See for Spring!

By MABEL HEBEL

**T**HE popular slim silhouette will be interpreted in new and refreshing ways this Spring—with tunics, draped panels, and handsome detail. However, there will be softer, easier lines appearing in several casual dresses, such as the shirtwaist, and printed skirts and evening separates will boast picturesque fullness.

The paired ensemble look will be found in everything from dresses with jackets and boleros to smart tunics over sheath dresses and jaunty capes or toppers lined to match the suit blouse.

Navy, as usual, is tops for Spring, but shares honors this time with the whole family of lilac and purple tones. Gold, in various shades, lends a bright note, especially the new golden melon color.

Silk is coming back this Spring and will lend a lustrous, rich air to any garment, no matter in which fabric it appears—chambray, Shantung, crepe, chiffon or faille.

You can count on No. 2342 as the indispensable soft print two-piece. Its slim, ease-pleated skirt and smart collar, cuff and pocket detail make it especially wearable.

No. 2254 is a dress created particularly to flatter the half-size figure. Make it with a soft bustline drape or pert bows below the tucked shoulder line.

If you like your cottons crisp and youthfully styled, you will want to make No. 2330. Its buttoned shoulders make it wonderfully easy to iron.

Charmingly casual and cut along soft shirtwaist lines, No. 2339 boasts a skirt of carefully controlled fullness. For delightful variety, do it in a sheer, print fabric.

Two versions of No. 2386, a cropped sleeve blouse—and both are wonderful ways to complement a suit or favorite skirt!

As a grand example of the ensemble look, No. 2361 offers these three attractive pieces to aid your wardrobe. Looks equally well in crisp faille or soft wool.

No. 11220 is a separate hot iron transfer pattern offering seven different motifs.

The most wonderful thing about No. 2378 is that the back and front are each cut in only one piece, with the waist darted to fit. Two big pockets and buttoned shoulders, too!

Cute puppies playing at the yoke and hemline of No. 2320 offer sure-fire appeal to a young Miss. She will also love the tiny waist and flared skirt.

Eastertime, let her lead the Parade in  
(Continued on Opposite Page)

# His Apple Pie Won a Freezer

By MABEL HEBEL

Donald Burrows, a 16-year-old high school boy of Burt, N. Y., won applause on two counts in connection with a frozen apple pie contest which was one of the highlights of a frozen foods exhibit at the New York State Agricultural and Technical Institute at Alfred University, Alfred, N. Y.—his pie won first prize, and he was the only boy among 38 contestants!

The contest, sponsored jointly by 40 International Harvester dealers and Cease's Commissary, was open to young men and women under 21 years of age. Nearly 1,000 apple pies were entered in 40 local contests. The winners competed in the finals at Alfred for a first prize of either a \$250 scholarship at Alfred University or an International Harvester home freezer. Donald chose the freezer.

Besides the frozen apple pie contest, the frozen foods show included demonstrations of processing fruits, vegetables, meats and poultry for freezing; techniques in growing varieties of vegetables suitable for freezing; a display of packaging materials; a model locker plant, and machines and methods used in commercial freezing. Home freezers were exhibited by a number of manufacturers, including Emil Steinhurst & Sons, International Harvester, Hot Point, Cold Spot, DeLaval, Orley, and Kelvinator. More than 3,500 people were on hand for the event.

Knowing that many readers would be interested in getting Donald Burrows'

recipe for the pie that won the freezer, I wrote him for it—and here it is just as he sent it to me. In his letter, Donald stressed the fact that he used Golden Delicious apples in his pie, and that he selected only those of the best quality.

## APPLE PIE

### Crust

- 2 cups sifted flour
- ½ cup Mazola oil
- ¼ cup cold milk
- ¾ teaspoon salt

Mix all ingredients together with a pastry blender, and roll out the dough between wax paper.

### Filling

- 4 to 5 cups sliced Golden Delicious apples
- ½ teaspoon nutmeg
- ½ teaspoon cinnamon
- ½ cup brown sugar
- ½ cup white sugar
- 1 teaspoon butter

Mix together the sliced apples, nutmeg, cinnamon, and sugar, and place filling in pie shell. Put the teaspoon of butter on top of the sliced apples, and cover with top crust. Bake in hot oven (425°F.) for 40 minutes. Makes 1 (9-inch) pie. If pie is frozen, add 10 or 15 minutes to baking time.

In case you are wondering whether Donald's success resulted from long experience, the answer is no. His winning pie was the second apple pie he had ever baked in his life. His first apple pie won the local contest. Donald lives on a 65-acre fruit farm, owned and operated by his father.

Congratulations were showered on Donald Burrows (at left in picture) of Burt, N. Y., when Clay S. Mitchell (center) of International Harvester announced that Donald's apple pie had won first place in contest. At right is Joseph Pellegrino, Alfred University instructor.

## IT'S YOUR FIGURE

By Kathleen Berresford, Nutritionist

THERE are figures and figures, but most women are interested in their own. And they want it slender. Or isn't that so? I do know a few women who wear size 44 dresses and claim they are happy that way, but I think it's probably because they don't know how easy it is to take off those extra pounds and slip into a size 36.

Some women, too, are afraid their faces will look wrinkled and scrawny if they get thinner. They would be pleasantly surprised actually to see how much younger they would look—and feel. It's important for a woman to look young and trim. But when she feels young too, her whole life changes. She's peppy, finds new interests, and doesn't tire as quickly. When her husband suggests going some place, she's not all worn out. And if she has a nice trim figure, her husband will want to take her out often and show her off.

Of course, it takes some willpower to start turning down juicy pies and frosted cakes. You have to decide for yourself which comes first—your figure or your sweet tooth. You have to give yourself a good talking to when you are tempted to slip. Too strict a diet can be discouraging. Being in too much of a hurry to see the pounds roll off makes the diet hard work. Unless you are reducing under the direction of your doctor, you should plan to lose only one or two pounds a week.

Select a diet that gives you the nourishing foods without the frills, and keep the portions small. If your diet includes vegetables, fresh fruit, meat, eggs, skim milk, and a small amount of bread or potatoes, your health will stay built up while your weight is going down. You'll have firm flesh, that trim figure, and oh, how much better you'll feel!

## SEW AND SAVE!

JUST off the press, our FASHION BOOK for Spring and Summer, beautifully illustrated, brings you the newest in fashion and presents it in practical pattern designs, easy to make, delightful to wear. Featuring:

- The new wrapped silhouette
- Basic dress with change-about fashion details

Address AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## Effective Cough Syrup, Home-Mixed for Extra Economy

Saves Big Dollars. No Cooking.

This splendid recipe is used by millions because it makes such an effective medicine for coughs due to colds. It's so easy to mix—a child could do it.

From any druggist get 2½ ounces of Pinex, a special compound of proven ingredients, in concentrated form, well-known for its soothing effect on throat and bronchial irritations.

Then make a syrup with two cups of granulated sugar and one cup of water. No cooking needed. Or you can use corn syrup or liquid honey, instead of sugar syrup.

Put the Pinex into a pint bottle and fill up with your syrup. This makes a full pint of cough medicine, very effective and quick-acting, and you get about four times as much for your money. It never spoils, and children love its pleasant taste.

This cough syrup takes hold of coughs, giving quick relief. It loosens phlegm, soothes irritated membranes, helps clear air passages. Money refunded if Pinex doesn't please.

FOR EXTRA CONVENIENCE GET NEW READY-MIXED, READY-TO-USE PINEX!

## MANY NEVER SUSPECT CAUSE OF BACKACHES

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

### WHAT'S GONE BEFORE

Deciding to join Abe Lincoln's volunteers, Mark Wilson marries his sweetheart, Ann Clinton, and leaves immediately for camp. Later, Mark's brother, young Charlie, runs away to enlist, and not long afterwards their father, George Wilson, tells his wife Nancy that he feels duty-bound to go also. He sells off most of the cattle and arranges the farm work so that Nancy and Tom can manage it with a little help from the girls. The day before he leaves Ann tells him that her father has enlisted, leaving her to struggle with what farm work she can carry on, and with the knowledge that the mortgage is now owned by Henry Bain, a neighboring farmer who hates Mark and is in love with her.

### CHAPTER XI

THE summer of '61 dragged slowly by. Although Ann visited the post office regularly, letters were rare. Even Mark wrote less frequently. There was little time or opportunity for the men to write, and they were awkward at expressing themselves. Both Ann and Nancy drugged themselves with work. The work had to be done, and there was no one to do it except the women and children, with occasional help from Enoch Payne.

Some of the work was pleasant. When not too tired, Ann loved to go down the long lane that led to the creek pasture and bring the cows home at night. There was something about lanes, she thought, that made you love them. The cowpath that zigzagged back and forth between the fences, the woodchuck that occasionally whistled angrily at her when she approached so quietly that he did not hear her in time to get into his hole, the summer smells from the fields, and especially the cows themselves, waddling along, their full udders swinging from side to side, their breath pleasantly odorous from the pasture grasses.

But after she had them fastened in their stanchions in the barn, her legs grew tired and cramped from holding the pail, heavy with milk, between her knees. Before the milking was finished her hands would cramp so that it was hard for her to carry the full pails over the stile that led across the stone wall bordering the farmyard and into the cellar. Still it was pleasant to see the foaming milk gradually climb toward the top of the pail as she milked, or to squirt the milk from the cow's teat directly into the old Tomcat's mouth as he sat up straight back of the cow waiting for it. It was nice also to turn the slow moving beasts loose after milking and watch them move down the lane.

When the chores were finished after the long day in the fields, there was still her trip to the post office, and when she got home again Ann was so tired that she could hardly wait to get her clothes off and fall into bed, no matter how early in the evening it was. Some nights when Ann wasn't too weary, and after her mother had gone to bed, she loved to fill the wash-tub with warm water and scrub her beautiful skin free of the accumulated dust and dirt from farm work, imagining that she was making herself nice for Mark but too often, tired as she was—and possibly that was part of the reason—after she had crawled into her bed she could not sleep wondering and

worrying where her boy was and longing so intensely for that time when he would be home again. Mornings after such sleepless nights it was difficult for Ann to start the long, hard daily rounds of work. When milking the cows or doing her other chores, she would think hopelessly of the time after time that she would have to do those same chores again before she ever could hope to see her husband. Almost every time when she looked at her corn field or at the other growing crops, her natural joy in seeing things grow was tempered by the thought that those same crops no doubt would grow to maturity, be harvested and probably used before she could see her Mark again. Thus marched the slow days of her life.

Some of the farm field work was beyond her strength and skill. Enoch Payne could be hired, but the big problem was the lack of cash with which to pay him. Realizing this, he often refused to accept pay, so Ann tried to get along without his help as much as she could, for her pride rebelled at the idea of accepting his work for nothing.

One day late in August when there seemed to be a little respite in the farm work, Ann came over and said to Nancy that the blackberries must be getting ripe, and if Nancy didn't mind she'd like to take the girls and go back on the hill where she knew there would be blackberries in an old slashing. Ellen, Elizabeth and Hattie were delighted at the prospect. Life was dull for them, too. They fixed some sandwiches, filled a quart can with milk,

and then climbed the hill pasture, finally coming to a big piece of woods near the top.

Stopping to rest, Ann turned to look back at the valley below them, the familiar country where she had been born and raised. Directly below, perhaps a mile away, were the house and barn of the Wilson homestead. Down the valley a little farther, nearer to the village, lay her own home, and still farther on she could see the houses of the little town almost obscured by the trees which overshadowed them. Above the trees like a sentinel rose the spire of the village church. Ann's thoughts went back to the night when she and Mark had stood in that church not so long ago when Timothy Belden had made them man and wife. With a sigh and tightening of throat she turned to gaze at the upper end of the valley, where the winding creek showed for miles here and there through the trees. Over the whole scene lay the smoky haze of late summer.

Catching the delicate fragrance of ripening buckwheat, she turned to look over the pasture fence and saw it, the stems a golden brown and still partly in bloom. From it came the pleasant summer sound of countless bees and insects feasting on the pollen. As she stood looking at the summer scene and let her gaze wander up and down the quiet farm valley, shining in the sunlight, the feeling of frustration, the worries and sadness of the past weeks dropped away from her temporarily. It seemed to her that God was trying to tell her that in spite of all the troubles, the worries, and the war, it was still a good world and, somehow, some time, all would be well.

Rested and refreshed in spirit, Ann led the girls along an old logging road that wound around the stumps and over the mudholes in the woods, coming after a while to an opening into a big slashing. Several acres in size, the slashing was like an island surrounded by forests. It had been timbered off two or three years earlier, and the blackberry brambles had sprung up everywhere, over the brush heaps and open spaces, until it was a tangled, almost impenetrable mass. But the blackberries on the high bushes, some of them higher than Ann could reach,

hung big and black on the vines. At the edge of the woods a spring of almost ice-cold water bubbled out of the earth and settled in a little depression, the overflow tinkling off down through the old leaves.

Here the girls deposited their lunch. Little Hattie was tired from the long walk and inclined to be cross, so Ann told her to lie down on the soft forest mold near the spring and to stay right there while the others picked the berries. Each took a pail and began picking. Ann suggested that Ellen and Elizabeth pick all they could right on the edge and warned them to keep within calling distance of Hattie.

Ann worked a little farther around the edge and broke into the bushes where the berries seemed especially big and thick. Disturbed by her presence, a catbird alighted not far from her and began to yell "Thief! Thief! Thief!" Ann laughed and called back, "Thief yourself!" It was intensely hot in the bushes, yet the berries ahead always seemed larger and blacker than those near her and their lure drew her farther and farther in. Intent on filling her 10-quart pail quickly, Ann failed to keep track of time until glancing at the sun she saw it was nearly noon. With a guilty feeling she turned to retrace her steps.

But that wasn't so easy. In working into the slashing after the best berries, she had zigzagged back and forth to avoid obstacles and the thickest of the bushes as much as she could. Now she was uncertain in which direction to go to get back out. The slashing was on a level so that she didn't have the slope of a hill to guide her, and the bushes higher than her head confused her sense of direction. The sun was of no help, either, for it was directly overhead.

She started to break a path through a clump of bushes in the direction which she thought might be right but it seemed that she was making no progress. The briars were vicious, tearing at her clothes and her stockings with almost devilish perversity, and the flies—to which she had given little thought when engrossed in her berry-picking—now buzzed about her head in swarms.

Finally, Ann managed to reach a big pile of fallen logs and brush, and in attempting to climb over it she stepped into a hole between the logs and went down, spilling her berries. Her leg hurt badly, and fearing that she had broken it or sprained her ankle she hauled herself up on a rotten log and gingerly examined her foot and leg. Satisfied that nothing more serious than a bad twist had resulted from her fall, Ann looked ruefully at her overturned pail with only a few berries left in the bottom. For a moment she wished she were a man so that she could use language suitable to the occasion.

As she stooped to pick up her pail, Ann realized that she still didn't know which direction to follow to get out of the slashing, but could think of nothing better to do than to plow ahead through the tall bushes. Veering off to one side to avoid a particularly thick clump of brush, she found herself looking at a little clearing a few feet in diameter. She started to go into it, and then stepped back with a startled exclamation. Ambling across the open space, stopping frequently to nuzzle something out of the ground, was a mother skunk, and following her were her six little black and white kittens. Apparently hearing Ann's exclamation, the skunk turned suddenly to face her. Quicker than she would have thought possible, Ann dodged back around the bushes. Nothing could be euter-looking than these kittens, she thought with a wry smile, but that kind of euteness was better admired from a distance.

Retracing her steps a short distance to make sure of avoiding the skunk, she suddenly came upon the path that she had broken through the bushes in

## With AMERICAN AGRICULTURIST Advertisers

During the past 20 years there has been a wonderful revival of interest in grass among northeastern farmers. You will find the booklet entitled "A Guide to Better Pastures" full of ideas. To get it, write to SWIFT & COMPANY, Plant Food Division, Chicago 9, Ill., and a copy will be sent to you without charge.

The Piedmont Tractor Division of INEXCO CORPORATION has moved into a new plant in Kyser, West Virginia.

In current issues of AMERICAN AGRICULTURIST you will find offers of many seed and nursery stock catalogs. All AMERICAN AGRICULTURIST advertisers will be glad to send you their catalogs without obligation. Seed catalogs are always as good as a spring tonic and, in addition, give you much information about new varieties and, in many cases, cultural practices. Now is the time to get them.

One of the newer farm tools is the chain saw. By using the coupon on page 14 of the January 20 issue you can easily get a copy of the pamphlet entitled "How to Cut Costs and Make Money with Chain Saws" by sending the coupon to HENRY DISSTON & SONS, Philadelphia, Pa.

You will find "Practical Pointers on Engine Maintenance" full of tips on the operation and repair of gasoline engines. It is yours for the asking from the ETHYL CORPORATION, 100 Park Avenue, New York 17, N. Y.

Rabbits are a problem on many farm and village gardens. Under the trade name "No-Nib!" the B. F. GOODRICH CHEMICAL COMPANY, 324 Rose Building, Cleveland 15, Ohio, has a new rabbit repellent which can be sprayed on vegetables to protect them. This company also has Z.I.P., a deer and rabbit repellent for orchards, nursery stock, and certain row crops.

According to the trade paper, "Implement and Tractor," 532,315 farm tractors were manufactured in 1950, which is the third highest number in history of the industry. Retail sales of tractors and farm equipment for 1950 totaled \$2,346 millions, just a little below the record made in 1948.

An interesting development is the Latch-On Utility Carrier which can be attached to the CASE "VA" Series Tractors with hydraulic control and Eagle Hitch. The carrier can be lowered to the ground for easy loading and then raised for transportation. For handling small loads around the farm it is perhaps the most convenient device available to the farmer. It does away with much heavy lifting. It is ideal for carrying spray tanks for field spraying, for hauling baled hay to feed bunks, milk cans from barn to the road, and many other jobs.

## NO DRUMS

(Continued from Opposite Page)

the first place, and then found her way without further difficulty back to the edge of the slashing.

Going directly to the spring, Ann was disturbed to find that Hattie was not there. However, she felt sure that she must have joined the other girls, so she started along the edge of the slashing, calling to the girls as she went, and finally heard an answer. Ellen and Elizabeth came hurrying toward her, but they were alone. To her question, "Where's Hattie?" they answered:

"By the spring."

"She isn't there," Ann said, sharply. "I told you to keep watch of her."

"Well, we thought you wanted us to pick berries. There weren't any good ones right there by the spring."

Now thoroughly alarmed, Ann started back with the girls toward the spring and started calling:

"Hattie! Hattie!"

But there was no response. Almost frantic, Ann gave emphatic orders to Elizabeth not to move away from the spring. Then she directed Ellen to walk in one direction around the edge between the woods and the clearing while she herself started around the other way. As they went they kept calling to Hattie and to each other, but could find no trace of the child. Finally, leaving Ellen by the spring with Elizabeth, Ann circled around through the woods keeping a hundred yards or so from the slashing and calling the child's name until she was hoarse. When she had completed the round, almost in despair and deadly tired, she came back and sat down by the spring, dropped her face on her hands and tried to think what to do next. Suddenly Ellen yelled:

"There she is!"

Sure enough, crawling out from a mat of bushes and grasses not more than twenty feet away was Hattie, her hair matted with leaves and twigs, her dress torn, but she herself in good spirits. Ann rushed to pick her up, crying:

"Where have you been?"

Calmly Hattie replied:

"Went to pick berries. Went to sleep."

Too thankful to scold, Ann hugged her and then set her down suddenly, aware that her knees were trembling so that she couldn't stand. But in a few minutes she went over to the spring, bathed her hot face in the cold water, and then they ate their lunch.

Lunch over, Ann decided it was time to start home, and off they went, the children proud of the berries they had to show their mother. But the day wasn't yet over. Ann had been so intent on trying to find Hattie that she hadn't noticed that the sky was clouding over and that there was a distant rumbling of thunder. In the woods now it sounded louder and she tried to hurry the children along faster.

Coming out of the woods to the pasture that overlooked the valley, Ann realized that they could not outrun the storm to the house. The thunder was now ominously near, and although accustomed to country storms, Ann couldn't remember when she had ever seen the western sky so black and angry looking.

Undecided, she halted, and as they waited a great wind came roaring down across the valley and up the hill, bending the trees before it and finally reaching them with such force that it became almost impossible to stand up against it. Following the wind over the northwestern hills they could see a gray wall of rain coming fast. Ellen exclaimed:

"Let's get under that big chestnut, Ann. It'll protect us some."

"No," said Ann, sharply. "The lightning might hit the tree. We must stay right out here in the open." Frightened,

## CAMP IN WINTER

By Edith Shaw Butler

Winter has come, there is snow on the bough;

The camp in the pines is deserted now. Wind rattles the shutters and bangs at the door,

The shadows are blue on the forest floor.

Only the squirrels and chickadees

Go about their business among the trees, While the camp in the pines, with secrets to keep,

Has snow on its roof and is fast asleep.

the two younger girls began to cry.

Like galloping horses in a cavalry charge, the wall of rain swept toward them. It seemed to Ann that the very heavens had opened up to dump out a whole lake. Frequent sharp flashes of lightning were followed by the almost continuous rumbling of the thunder. Suddenly came a crash that left their arms tingling as if they had been asleep, and the big chestnut tree suddenly showed a white streak of raw wood where the bolt had stripped the bark.

Drenched to the skin and crying in terror, the children huddled as close to Ann as they could for comfort. To their right, only a few feet away, a huge old pine that had been a landmark for years, crashed to the ground, unable to stand up against the terrific wind.

Then the storm passed more quickly than it had come. The thunder rumbled and growled away over the woods and hills to the east of them until it subsided to a distant mutter. The rain let up, and as the bedraggled little party started down across the pasture lot, the sun tried tentatively to peep through the clouds a few times and finally came out to stay. Ann looked ruefully at the berries which were now almost floating in the pails, and then said aloud to the girls:

"What a day!"

Then she thought aloud to herself:

"Well, at least I haven't had much time today to worry about Mark or the farm or anything else except to get the girls safely home again."

(To be continued)

— A.A. —

## DAIRYMEN'S LEAGUE CALLS CERTIFICATES

The Board of Directors of the Dairymen's League has authorized Treasurer Ernest Strobeck to call all outstanding certificates of indebtedness of series 1953 as of next May 1. On or after that date the treasurer's office will cash such certificates. They may be sent to the Dairymen's League Cooperative Association, Inc., 100 Park Avenue, New York 17, N. Y., by registered mail. The par value of these certificates is \$1,193,414. It is interesting to recall that when the pooling plan was first started, there were dire predictions that these certificates of indebtedness would be worthless. The predictions fell flat because the certificates have always been paid when due, and in most cases before they were due.

— A.A. —

The estimated income to U. S. poultry farmers for eggs in 1933 was \$400,000,000. In 1950 it was \$1,600,000,000. In 1933 egg production was 3,255,000,000 dozens compared with 1950 estimate of 5,400,000,000 dozens.

Only 10 More Years  
and I'll Be 65...

## Then I Can Retire

Yes, thanks to my Farmers and Traders retirement plan, I can retire when I'm 65, with an income that will let me live comfortably and travel when and where I please.

You too can plan for retirement if you act now. Find out about the new Farmers and Traders policy that combines retirement and family protection in one low-cost policy.

## TAKE THE RISK out of RAISING CORN!

When you plant Funk G Hybrids, you actually reduce the risk of failure.

Why? Because Funk G Hybrids start faster—stand up better—and resist disease, insects and drought. These qualities prove their value when short growing seasons, adverse weather conditions or poor soil affect other corn.

This year be safe. Don't let crop hazards affect your future harvest. Plant Funk G Hybrids for bigger yields of better corn.

Find out which Funk G Hybrids are especially bred to produce outstanding results in your area. Get the facts! Mail coupon below.

# Kernels, Screenings and Chaff At Hayfields

By TOM MILLIMAN

## 1950 INFLUENCES 1951

**A**LTHOUGH long experience reveals that something less than 100% of the plans can be carried out, it is thrilling to make future farm plans, field by field, crop by crop. To declare where we're going, it seems advisable to first see where we've been, and where we stand now at the threshold of the 1951 production year. Of the many things we learned at Hayfields in 1950, two lessons stand out.

*Good Northeastern land seeded to modern pasture will yield in milk, or in growth of dairy heifers, returns equal to the farm value of corn grown on average land of the cornbelt. Cornbelt land is higher priced.*

This statement takes in a lot of territory, as farmers say, yet it is not a statement idly made. The agricultural professors have been right all along; in fact our 1950 findings prove them to be quite conservative. In 1950 we provided slightly less than half an acre of brome-ladino-alfalfa pasture for each large heifer and dry cow. This amount, instead of being scanty, was so liberal that the field had to be mowed and some hay taken off, and stacked.

After adjoining fields were mowed the aftermath came up promptly, and before mid-July the dry stock was shifted to it. Throughout the season, an average of 31 head subsisted on the 15 acres of pasture and 30 acres aftermath, for a total of 45 acres. From 18 acres of the 45 we had one heavy first cutting, part for grass silage and part for hay. From 10 acres of the same 45, we had two cuttings of alfalfa. The dry stock grazed the third cutting. In a short dry period the small amount of stacked pasture hay was fed out. Finally the 31 head had pretty well grazed the 45 acres and were taken off the last day of October, some 10 to 15 days earlier than usual. As they left these fields, the cattle were in the finest condition we've ever experienced.

### Silage In June

Another satisfying experience which served to support the claim set forth above applies to hay cut early for grass silage, and involves 10 of the acres referred to. From this 10 acres, plus 8 acres in another field a mile away, we filled in June a 14x40 silo and another one 12x40. Allowing for the fact that grass silage is heavier than corn silage, we have figured the green yield of brome-ladino-alfalfa at or close to 14 tons to the acre. The silos were filled chockablock over a period long enough to allow for some settling.

All our rotated hay fields and pastures are fertilized annually with 400 to the acre of 0-19-19 containing Borax.

The other real lesson from 1950 is:

*Good Northeastern manured sod well plowed will produce corn profitably and in successful competition with the cornbelt. So long as present freight rates and handling charges on midwestern corn continue, Northeastern corn seems to hold good promise.*

We are much nearer the markets for fresh milk, eggs, and meat, for which corn is needed. Here in the Northeast on our best sod fields at elevations of 1,200 ft. and less, we can really grow corn. It is a triple purpose crop at Hayfields, as it now is on countless other farms. The green corn is used to refill silos. What is left is mechan-

ically picked at a later date and placed in permanent and snowfence cribs. From these it is used as needed for grinding and mixing with oats and purchased ingredients. Finally any corn left over in the crib can be sold direct to poultrymen, to dairymen, or through feed trade channels.

In September 1950, Hayfields had more 1949 ear corn on hand than was needed for feed. We sold out of the permanent crib 12½ tons of dry shelled corn at a good price, the buyer doing the shelling. After refilling both silos in October, our 1950 crop of cribbed corn is a little larger than the year before, although our yield was only 75 bu. We had planted too thin in 1950, but fortunately we had more acres.

Year in, year out, Hayfields can count upon an average yield of 75 bu. of dry shelled corn on an acre. We've had 105 bu., and 95 bu. In one recent drouth year on leachy land we dropped to 55 bu. It may not be king as in the mid-West, for in the Northeast we reserve that title for grass, yet corn is a prince of a crop.

## NOW FOR '51

### Patching a Pasture

**F**OR 25 years we fiddled around, neglected, and had little results on a 25-acre pasture, one corner of which adjoins the cowbarn. This piece of outdoors is variously small irregular plateau, very steep slope, shaly bottom and swamp. In the summer of 1948, we plowed up the little plateau, fertilized and reseeded it at once to brome-ladino-alfalfa. In 1949, the results were good, but in 1950—due to good pasture elsewhere and inability to clip at the right time because of illnesses—the grass took over and ran out the legumes completely. This patch is now plowed again and will be seeded in spring to straight birdsfoot trefoil with oats as a nursecrop to be grazed off. In the dry year of '49, at the foot of the slope we plowed up 4 acres in the spring and seeded to birdsfoot with brome and oats as a nursecrop. Now we have a wonderful stand of birdsfoot, considering the alternate shaly and swampy types of ground.

*Three other patches in this pasture will be tackled this spring and all seeded to birdsfoot trefoil with oats to be grazed. The birdsfoot, unlike the ladino, will stay. Altogether we'll have reclaimed from a state of relative worthlessness half or more of this jumbled 25-acre tax-eating area of hardscrabble. It lay there for 25 years*

1951 Pasture. Seeded in spring, 1950, with oats. The oats were grazed off. The picture was taken on September 29, 1950, in the orchard grass-ladino-alfalfa half of the pasture. The other half is brome grass-ladino-alfalfa. Electric fence will separate the two halves for rotational grazing of milking cows. This pasture was laid down to the specifications of 12 experts and is the most promising we've ever had. In due time, a report will be made on how much milk and how many cow grazing days each acre yielded.

*merely serving to help hold the world together. The only alibi we can think of is that birdsfoot trefoil wasn't known 25 years ago. But it has been favorably known to us for 13 years as an eastern New York legume, and it remained for others to prove birdsfoot belongs in western New York as well.*

### Shoot For 120 on 26

A pasture of 16 acres on the opposite side of the cowbarn from the patched hillside is good land which was seeded to orchard grass-ladino-alfalfa and has now been grazed three years. It is being winter manured in preparation for corn in '51. Beyond it is about 10 acres of similar land used for mixed hay and aftermath for four years and now completely manured. This field will join the other in growing corn for grain and silage. *The goal is 120 bu. of dry shelled corn from each of the 26 acres.*

These fields have been regularly rotated with legumes, manured and fertilized for a quarter century. It was one of them which made the yield of 105 bu. of corn mentioned above. Weather is the chief factor which may hold us away from the 120 bushel goal. In any case, barring disaster from continuous drouth or inability to plant and cultivate because of wet weather, we can count upon a minimum of 75 bu. of dry shelled corn or its equivalent in silage. Thus if the goal is missed there will be no regrets. It costs no more to have a goal. A report will be made.

### Most Important of All

*Our principal 1951 ambition is to supply each animal on the place at whatever age, with all the good quality pasture, grass silage, corn silage, and hay she can eat. It is a large order. We have never yet accomplished it in terms of high quality for every day in the year. If we can do it in 1951, good growth of animals, good production from each acre, each man, and each cow will be assured at favorable unit cost.*

As additional backing for the effort to reach this most difficult goal, we intend to provide a third silo in the spring. Thus the first cutting of good mixed hay and alfalfa can be put away in the grass stage, with much less hindrance from weather and with far

better assurance of preserving maximum feeding values and palatability. The practice of making grass silage also provides earlier, more, and better aftermath for second-cutting hay or for grazing. Legumes last longer in mixed hay when the first crop goes into the silo. At Hayfields next June, we shall be putting up grass silage for the 15th consecutive year. Our mistake has not been that we failed to start when young enough, but rather that we've been too slow to change to more grass silage and less dry hay. The facts in favor of grass silage were present all this time.

## FAREWELL—PEA BEANS

**M**Y earliest recollection of working in fields has to do as a boy with forking beans after school and on September Saturdays. That was in Livingston County, N. Y. Beans were and still are an important cash crop all through Western New York, where 136,000 acres were grown in 1950.

At Hayfields in Monroe Co., some 17 miles Northwest of the boyhood experience, we've generally grown beans as a cash crop. Being in the pea bean district, we've had these little white beans which produce best on our kind of soil. Our yield in 1950 was comparatively good, but now we are quitting. Why?

*Unlike corn, grass, legumes, peas and other canning crops, beans are limited in their response to fertility. When nitrogen is built up from rotation and manuring, beans carry too much foliage and are delayed in ripening. Added phosphate and potash do not make the full increase in yield of beans which can be expected from other crops. Seed and harvesting are expensive with beans, and hired labor comes high. Corn and grain will yield more dollars from an acre and is less risky at harvest time.*

Although quite a number of farmers have already cut bean acreage to provide for more corn, especially in the pea bean district, plenty of beans will still be grown, particularly of the red kidney variety East of the Genesee River. Reds do well on heavier soil and can better take bad harvest weather. It is on land rather well built up in organic matter that corn is more profitable and beans less so.

## KOROK DOORS

Swing open the 2-foot square door on a Korok Silo — you'll agree it was built for your convenience. Safe, handy Steplock draws door tight, yet lifts easily to release lock.

## THE ACID TEST

... shows Korok tile stave silos best. They're acid-proof — not just acid-resistant. Rust and rot proof. Triple-sealed insulation gives real protection against frost. Longest life, minimum upkeep — that's real economy.

### KEEP YOUR DRAFT BOARD INFORMED

The apparent difference in the number of deferments to essential farm workers is due entirely to variations in attitude of different draft boards. While some suggestions have been given to draft boards, in the final analysis each draft board decides each case.

In New York State the Conference Board of Farm Organizations has prepared a sheet which gives a certain number of points to each unit of a farm enterprise with the suggestion that young men who are handling 20 points, as shown on the blank, are essential. In other words, if a farm enterprise shows 40 points or more, the owner obviously needs a hired man if he is to continue to produce the amount of food he has in the past. Even here, however, the draft board is not required to consider the information given on the sheet.

In Connecticut the draft boards use a form very similar to the one in New York, with the same standards, namely, that 20 units indicate that the man should be carefully considered for deferment.

In Vermont a somewhat different questionnaire is used, known as Form 24. There is at least one dirt farmer on each of the 14 local boards in the state.

In Maryland a draft board may appeal to the USDA County Council for additional information about farm workers to supplement the information set forth in questionnaire SSS Form 100.

In Pennsylvania, each case is considered on its own merits, but an attempt is made to keep key men on the farm. The State Selective Service, in conjunction with the Governor's Farm Labor Advisory Council, is trying to work out a formula which will standardize the thinking of local boards and eliminate the discrepancy in deferments.

Here are some suggestions for steps that can be taken by a farmer who has a son or hired man whom he considers essential, or by a young farm owner who is eligible for the draft:

1. Give the draft board complete information even though the young man in question has not yet been drafted.

2. Talk with the chairman of your draft board, pointing out the importance of knowing well in advance if the young man in question is likely to be drafted.

A further step which could well be taken by one or more local farm organizations is to find out whether or not the draft board has sound advice on the farm situation and, if not, to suggest that such advice be sought.

There is no intent on the part of any farm group and, we trust, on the part of any individual, to expect special consideration. However, if food production is to be maintained it is important that the boys who are essential to farm work be left on the farm.

— A. A. —

### COMMON STOCK

Back in 1941, I bought some common stock in a company. I didn't get any dividends last year. They claimed that no common stock dividends were declared payable last year, but that doesn't seem right. Would you please see why I haven't received any money from this company?

If you buy stock in a company and the company makes a profit, the directors will declare a dividend. However, if the company makes no profit, no dividends are paid. That is why it is important, if you plan to buy stock, to investigate carefully to be sure that the company in which you invest has a long record of regular payment of dividends. In that way, you can be pretty sure that you will get some return.

# RILCO Rafters

ARE THE ANSWER  
Fast construction at low cost

### Up goes a

**RILCO BARN.** No cutting! No fitting! Rilco laminated wood rafters make the sturdy wind resistant framing for this modern, attractive barn. They are delivered cut to exact lengths, drilled for hardware... ready for rapid, easy assembly.

Engineered connectors furnished assure extra strength, rigidity. Interior mow space is 100% usable because Rilco clear-span construction requires no posts or braces.

Rilco barn rafters are factory fabricated from finish grade, kiln dried Douglas Fir permanently bonded with waterproof resorcinol glue. Rilco barns can be built in various widths and in any length. Available in several standard shapes to provide the exact hay storage capacity you need. May be constructed with or without a mow driveway.

Discuss your building plans with your Rilco lumber dealer. He'll gladly show how Rilco Rafters can save you time and money.

**MILK IS MONEY!**  
**DON'T FEED IT TO YOUR CALVES!**

## Feed **KAFF-A**

*the safe replacement for milk.*

Every time you feed a pail of milk to a calf—it's just like giving him money to drink. Because if you took that milk to the dairy—that's what you'd get for it—money. And at today's milk prices—*plenty* of money! So don't feed that milk money to your calves. Feed Kaff-A! Just one 50-lb. box of Kaff-A, fed with low-cost hay and grain, releases up to 500 pounds of milk you can sell.

You can raise calves with Kaff-A that are just as healthy and fast-growing as if you fed them milk. Kaff-A is an absolutely safe replacement for milk. A million healthy heifers have already been raised on it. In fact, Kaff-A is made from buttermilk, other

dairy by-products, some cereal products and plenty of Vitamin A and D Feeding Oil.

**Don't buy imitations** and lose dollars to save cents. Kaff-A is the replacement for milk that's tried, tested, proved. A few pennies saved on an inferior imitation of Kaff-A may cost you many a dollar if your calf is slow to develop into a mature cow. Feed Kaff-A and sell your cow's milk without fear. Fed as directed, Kaff-A will help give you milkers and breeders that are as good as if they'd been started on whole milk. Buy a pail or box of Kaff-A from your feed store or milk plant *today!* Feed your calves the *safe* replacement for milk!

THE FARM PAPER OF THE NORTHEAST

## Sap's Running!

**MAPLE SYRUP IS BIG BUSINESS ON HERMAN SMITH'S VERMONT FARM**

By WILLIAM GILMAN

Where others produce syrup by the gallon, Herman Smith puts it out by the 35-gallon drum. Here he's filling one of them after boiling down an early sap run.

Big-scale sugaring requires something larger than the usual saphouse. Here, the two smoke stacks serve Smith's pair of evaporators.

**M**OST Vermont farmers would rather stick to their dairy cattle and produce maple syrup only as a sideline cash-crop before spring plowing comes along. But Herman A. Smith, of Richford, takes his sugaring a little more seriously than that. Instead of the customary small setup using a few hundred to a couple thousand buckets, he hangs over 7,000 of them through his hard maple woods below northern ridges of the Green Mountains.

Cattle on his farm are white-faces, raised for beef, and don't require much spring care. Smith and his two sons, Sheridan and Heustus, started with a dozen of the Herefords two years ago and plan steady expansion of the herd size.

Naturally, sap-running time is the busiest

Herman Smith at work with power tapper ahead of his young neighbor, Bruce Perry, who is hanging buckets.

season on the Smith place covering 460 acres, of which only 10 are now tilled. The man-sized operation requires a pair of evaporators in the saphouse, a pair of power tappers and over a half dozen helpers. Three teams gather sap, bringing it to seven stations in the woods from which the sap continues through five gravity pipelines to storage tanks supplying the evaporators.

A true woodsman at heart, Herman was a timber cruiser for many years but always managed to find time for some sugaring. The first sap he boiled was when he was six years old. He's 62, and never missed sugaring.

He's proud of the young maple stand near his sugaring works. Although cut over several years ago, maples were given a chance to come back. That woods is now chockful of youngsters from one to five inches in diameter. Whether he or somebody else benefits from them, mapleman Smith is positive that they represent a sound investment in the future.

# Both Doing Fine . . .

**The Calf** . . . Eating Well and Growing  
Strong with No Help from Mother.

**I**T doesn't take long—in fact within 48 hours a calf can be completely independent of her dam. This early age is the best time to start pail feeding of either whole milk or a good milk replacement such as Calf-Kit. A calf's appetite will grow fast from here on and within a few days G.L.F. Calf Starter can be fed as the amount of milk is reduced.

G.L.F. Calf Starter is made of much the same ingredients as a good fitting ration—corn meal, bran, crushed oats, oil meals, molasses. Additional ingredients are added to supply the extra vitamins and minerals the young calf ordinarily gets from milk. Thus the Calf Starter-fed calf gets all the advantages of milk feeding, and starts earlier to develop the size and body capacity that make a good producer.

**G.L.F.**  
**Calf Starter**

**The Cow** . . . Back in Full Production  
and in Good Condition.

**A**N ounce of prevention is worth a pound of cure"—this old proverb applies to cows that have dried off, and it really pays when they freshen. Most cows lose weight for three to six weeks after calving because they do not eat enough to provide body maintenance and milk production.

Feeding G.L.F. Dry and Freshening Ration during the dry period and after freshening, the time when many cows are somewhat finicky, will better condition cows for the production period ahead.

G.L.F. Dry and Freshening Ration is bulky, low in protein, and very palatable. It has a cooling, laxative effect and greatly relieves the congestion and fever in the udder. The additional milk yield from cows in good condition more than offsets the cost of the feed required. Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

## Keystone State Potato Growers Sell Cooperatively

**B**ACK in 1936, Dr. E. L. Nixon, a noted authority on potatoes then at Penn State, was the spark plug in starting a cooperative potato marketing venture among Pennsylvania potato growers. Since then, "Pennsylvania Potato Growers, Inc." has grown until it handles about 20 per cent of the State's crop. Dr. Nixon is still busy as counselor for the Pennsylvania Chain Store Council and as adviser to the cooperative group he inspired.

At the recent joint session of the Empire State Potato Club and the New York State Vegetable Growers Association, S. S. Westrick, general manager of the Cooperative, told about the results and advantages of the program. Following his talk, I asked him questions which lack of time had prevented his covering during the meeting.

Any Pennsylvania potato grower may join the Pennsylvania Cooperative Potato Growers, Inc., by paying a \$1.00 membership fee and signing an agreement to grade his potatoes as directed by the Association. The only condition that might hold up a prospective member is that new members are accepted only as fast as markets are available. New markets are being developed. The present volume being sold is running about 40 per cent ahead of last year.

### Moderate Fees

The \$1.00 membership fee is not the only cost. The selling services of the Cooperative cost each grower-member about 5 cents a hundred. This is added to the cost of the "blue label" branded bags furnished to growers. The inclusion of this fee in the cost of bags eliminates a considerable amount of bookkeeping, thereby cutting costs. The Association reserves the right to drop a member whose grading is unsatisfactory, and the grower has the right to drop out whenever he is dissatisfied.

Naturally the Association first attempts to correct any unsatisfactory grading. One method is to permit a grower to hire his potatoes graded by some other member who has paid \$3.00 for a grading permit.

The Cooperative, with headquarters at Allentown, Pa., has five branch offices throughout the State. Here buy-

Area Manager Roy T. Wotring of the Allentown Office checking grading at E. O. Mastin Farm, Quakertown, Montgomery Co., Pa. In 1950, Mr. Mastin grew 937 bushels of potatoes on an acre of surface-irrigated land.

ers are contacted and, as sales are made, the potatoes are delivered to the buyer from the nearest farms. To a considerable extent this saving on transportation costs fulfills one of the mottoes of the Cooperative—"From the grower to the nearest kitchen."

### Discussing Problems

Frequent meetings are held where buyers and growers can discuss their differences. From the buyer's point of view the advantages in buying from the Cooperative are the guaranteed quality and a steady, dependable source of supply. The grower is pleased because he gets a premium, which recently has been running from 1 to 2 cents a peck. That the deal is satisfactory to both parties is indicated by a volume this year equivalent to 15 million pecks of potatoes.

The chief variety grown is Katahdin. Late potatoes are not labeled by variety—only by grade, but Cobblers are identified, as they bring a slightly lower price.

While the idea of the Association is to market as much of the crop as possible as U. S. No. 1's, every grower, whether he be in Pennsylvania, New York, New England, or New Jersey, has some potatoes that won't make the grade. The Association sells a volume of small potatoes to canners and some pick-outs to hucksters who cater to a trade definitely interested in price rather than quality.

In summing up, there are a couple of figures that interested me. For the 1951 crop, Pennsylvania members of the Association are averaging about \$1.50 a cwt. The exact amount received varies somewhat according to distance from market. Mr. Westrick says that 80 per cent of each dollar spent by potato consumers goes to producers. The marketing setup is simple and economical, and its steady growth indicates that it serves potato growers and buyers.

—H.L.C.

## Eats Up the Acres Under Toughest Going

8000 ACRES—and still going strong! Shown above is Myron C. McGraw, Taylor, Nebraska, who says: "This is my 4th season for using my NEW IDEA Mower and I have cut approximately 8000 acres of hay—mostly native upland grass which is 5 times as tough as alfalfa. I plan to make my next mower another NEW IDEA."

that's why a **NEW IDEA** is a good idea!

Just a few minutes—that's all it takes to hitch a NEW IDEA Mower to any tractor And that gives you what it takes to mow *any* hay field . . . smoother and easier . . . at a faster clip!

You're sure of cleaner, more even cutting on any kind of ground. This compact, whip-resistant mower trails straight and true—with full weight balanced on its own heavy but free-rolling wheels.

Cutter bar is lifted or lowered by tractor power—with just a tug of a trip rope—and fully protected against hidden obstructions by patented Automatic Safety Release.

Flexible power transmission lets you take square corners right in stride—with no time out for swingout, no cramping or binding.

Specially designed Pitman lock reduces sickle vibration. Knives stay snugly positioned against ledger plates—cut like brand-new scissors.

Speedier, surer cutting alone makes a NEW IDEA your shrewdest mower buy. But there's more, lots more! It's lighter in draft and a honey to handle. It's unhitched in a jiffy to free the tractor for use with other hay tools. It's built throughout to insure thriftiest operation. Get still further facts from your NEW IDEA dealer. You'll agree that this NEW IDEA is a better-than-good idea!

NEW IDEA Hydraulic Lift Tractor Mower: Combines all the outstanding qualities of the standard NEW IDEA mower—plus more exact control in lifting or lowering cutter bar. Hydraulic power quickly puts sickle up or down to any desired height from ground—and holds it firmly in position.

## HOW LONG WILL YOU STAND IT?

A REPORTER on the television program "Meet the Press," on Sunday afternoon, February 4, asked Senator Stiles Bridges of New Hampshire:

"Senator, supposing a GI in command of a tank in Korea refused to go forward on the orders of a superior officer, what would happen?"

The Senator said.

"Why, the man would be court-martialed and probably shot."

"Well, then," said the reporter, "is there any difference between that and the holdup of our whole American industry in time of war by the current strike of railroad switchmen?"

The Senator replied in effect that the only difference was that the strike was worse because it did more damage.

Everyone knows that should just one man hold up or delay the U. S. mails, he would be pursued relentlessly, run down, and imprisoned for a long term of years. Yet the strike threw hundreds of thousands of employees out of work and held up vital materials in the railroad yards badly needed for our soldiers in Korea. Dozens of cities were short of food and fuel, and if the strike had gone on a few days longer, there would have been actual hunger.

Do you remember from your history books that when a group of distillers in western Pennsylvania defied the people and the government, President George Washington rushed troops there, and the so-called Whiskey Rebellion did not last long. I remember also the Boston strike when Cal Coolidge was mayor of that city. Coolidge took prompt action, and the strike immediately blew up.

It would seem that we have troubles enough in the world and in this country without these unnecessary strikes. No fair-minded person is against good strong organization of workers, and no doubt there are many able and sincere labor leaders. But the strike is becoming an obsolete and barbaric custom whereby a relatively small minority of the people can make all of the rest of us suffer. Labor leaders and management must be forced to settle their difficulties by arbitration. The strike has become intolerable.

No one is to blame for strikes but the politicians, both Republicans and Democrats. For years they have appeased and even encouraged the labor barons until now the situation is well nigh out of hand. The question now is, How long are the people themselves going to stand it? How long are they going to stand for a government controlled by labor before they throw political labor appeasers out on their necks?

## CONGRATULATIONS!

AT THE annual meeting of the Farmers Production Credit Association of Ithaca on January 25, which was attended by 600 or more members and their wives, Mr. Leon Sinkim, President of the Association, and Mr. Harry W. Petzold, Secretary-treasurer, announced that Association members have paid off the last dollar of government capital and now own as well as operate their Production Credit Association.

In his most excellent speech on the same occasion, Mr. I. W. Duggan, Governor of the Farm Credit Administration, congratulated the Ithaca Association and then said:

"You will be glad to know that the members of 175 other Production Credit Associations located in 40 states have also achieved their goal of complete farmer ownership. The balance of the 500 Production Credit Associations throughout the country are also making rapid progress toward this end. At the peak, the government owned \$90,000,000 of the stock in Production Credit Associations. By June 30, 1950, it was down to \$18,000,000, and now it is even lower."

*By E. R. Eastman*

The same excellent situation exists with the National Farm Loan Associations. The entire capital stock of the Federal Land Bank of Springfield, Massachusetts, is owned by the 62 National Farm Loan Associations operating in the New England states, New York, and New Jersey. These associations, in turn, are owned by the member borrowers. That is truly marvelous progress.

High praise for the achievement in farmer ownership of these cooperative credit organizations is due to men like Governor Duggan and his associates and some of their predecessors in the central office at Washington, to the Farm Credit boards and the operating personnel at Springfield and in the other district offices, and particularly to the boards of directors of the local associations and the farmer members. All of these leaders set this goal of complete farmer, grass roots ownership for Farm Credit and have worked hard toward the accomplishment of that goal.

While talking of Farm Credit, a good word should also be said for the Intermediate Credit Corporations, which have been of untold help in using the joint credit of farmers on which to raise the money with which to make mortgage and short-term loans to farmers. And the members of farm cooperative organizations need also to be grateful for the help of the Banks for Cooperatives in the different Farm Credit districts for helping to finance these farmers' organizations.

## GREAT INTEREST IN FARM EQUIPMENT

ALWAYS in recent years when I attend a fair or a farm show of any kind where new farm equipment is exhibited, I marvel at the interest of farmers, particularly young farmers, in the machinery. It's not mere curiosity. They stand around for hours studying all the mechanical devices. They well know that the chief reason why farmers have so greatly increased production in recent years with less and less manpower is because of good equipment.

This year especially, with farm boys volunteering and being drafted, or attracted by high wages to the cities, machinery will be more important than ever. If the farmer is to maintain his production, he must make sure right now, first, that he has all the necessary equipment that he can afford, and, second, that what he has is made ready for the great spring crop campaign before that campaign opens.

## HE PRACTICES OUR HEALTH GAME

DO YOU remember the health resolutions in an editorial on this page in the January 20 issue? It was entitled "Try This Game," and I hope a lot of you are following the suggestions. A doctor friend writes:

"That 'Try This Game' editorial was a humdinger. That kind of health advice is just what people need."

My good friend, W. H. Danforth, eighty years young and founder of the Ralston Purina Company of St. Louis, is about the best example I know of how it pays to guard one's health. He has had a long, active, productive life, and is still going strong. He is straight and tall, without an extra pound of fat on him. Mr. Danforth writes:

"A four-square friend of yours (meaning himself) has read your editorial 'Try This Game.' I can qualify definitely with your suggestions, with a bit more emphasis on cereal products. I drink my 8 glasses of water a day, sleep eight hours, and masticate my food. I don't overeat, and I balance my food. I follow my own four-square program to 'Stand tall; Think tall; Smile tall; and Live tall.' I take ample rest, bathe regularly, brush my teeth, and visit the dentist every six months. I never have colds by avoiding people who have them. Life has

always been a game for me. If travel takes away my sleep, then I catch up. I know that with a good health program, at the end of four-score my life is rich with high hopes for more days of service as time goes on.

"Lastly, I fill my mind with thoughts on character and the eternal verities of life, which keeps my thinking free of hate and worry."

A wonderful program that has resulted in a wonderful life. Re-read "Try This Game" in the January 20 issue and try it. It's never too late to start.

## GRANDMA COWS AGAIN!

Mr. K. C. Sly, Manager of the McDonald Purebred Guernsey Farms at Cortland, New York, writes:

"Mr. McDonald and I noticed your editorial on grandma cows. We thought it might interest you to have just a brief story of a great-great-grandmother cow that we have in our herd.

"Douglaston Lady Augusta will be 18 years old in March, and just produced her 15th calf. She has nine sons and six daughters. The old cow has five milking daughters, and she and five daughters have had 53 calves, with no ease of twins in the family."

Mr. Sly gives the names in that splendid list of descendants of individual after individual who has classified "excellent" and as top producers. One of the daughters has a son, McDonald Farms Hale with a daughter that made 613 lbs. of butterfat as a two-year-old.

"There are," says Mr. Sly, "about 30 female descendants through the female line of old Lady Augusta. Practically every one of the family is living, and giving good account of herself."

"We are developing," Mr. Sly continues, "our whole herd on just such cows that have proved their ability to remain sound and breed on in old age, and whose families seem to have inherited those characteristics. We think that is much more important than to have a cow that produces a large record and then goes out of the herd as a young cow."

THAT IS the point that we of AMERICAN AGRICULTURIST have been trying to emphasize for years. That is why we have been trying to get dairymen, both with grades and purebred herds, to locate their grandmother cow, and, when by records they find that she is a real producer, to keep her and her offspring in the herd as long as possible.

The reason for such a policy is obvious. It is really absurd that an entire herd of cows has to be replaced after only four or five years of maximum production. What a ruinous expense! What a lot it would mean if we could extend the highest productive period of every dairy even just one more year!

## EASTMAN'S CHESTNUT

YOU KNOW I have the darndest time trying to find a chestnut that no one has heard before. I have a whole library of joke books and in addition to that hundreds of people send in what they think are good chestnuts. Once in a while there is a good one, but they are few and far between.

When I finally get one that I think is good, I test it out on the people around the AMERICAN AGRICULTURIST office or on Mrs. Eastman and Margaret, our cousin who lives with us, and dollars to doughnuts they'll look kind of smug and make some smart remark like: "I kicked the slats off my cradle when Grandpa used to tell that."

Well, last night while I was fussing around as usual trying to find a chestnut, Mrs. Eastman said:

"Tell this one."

Then she told the following story. I didn't tell her that I had heard it before—and it would serve her right if she got about a hundred letters from you telling her that you had, too. Anyway, here's the story:

There was a fellow sitting in a corner fussing with paper and pencil.

"What you doin'?" said his wife.

"I've jest larned to write," was his answer.

"Well, what'd you write?"

"Dunno. Ain't larned to read yet!"

## AA's Farmers' Dollar Guide

**PRICE CONTROLS:** As yet, farmers can sell produce for whatever the buyer will pay. The only freeze is on "mark-ups" by wholesalers and retailers. However prices to consumers are under ceilings, therefore, dealers will try to buy from farmers at prices that will allow profits all along the line. According to law, ceilings cannot be put on farm products below parity at the farm, but present ceilings on "mark-ups" do, in effect, go contrary to law because they limit what buyers can pay and make a profit.

Meat animals are above parity, therefore subject to price ceilings. Present price orders are being characterized as a mess, with more explanations and regulations coming which may help or may cause more confusion.

Theoretically at least, farm wages are frozen (as are other wages) but "easing up" is expected to permit all labor, both farm and industrial, to get about 10% above early 1950 pay.

Eric Johnston who, it is said, is not a "dyed in the wool" bureaucratic controller, hopes that controls may be temporary (a doubtful hope). Economists agree that the freeze will not (and was not intended to) halt price increases in their tracks, but rather to slow them up.

Opponents of price fixing, and there are many, point out that the most effective ways of halting price increases are: Government economy on domestic expenses, credit tightening, higher taxes to "pay as we go" as nearly as possible, and above all, increased production. The current railroad strike, which we trust will be settled before you read this, is characterized by a demand for a reduction of work week from 48 to 40 hours with no reduction in take home pay.

**COMING MILK PRICES:** Dr. H. P. Young, economist for the Milk Producers Bargaining Agency, estimates the blend price to farmers shipping to New York in coming months as follows: January, \$4.80; February, \$4.69; March, \$4.46; April, \$4.22; May, \$4.00; June, \$4.00. (Since the above estimates were made, Dr. Young has revised them upward from 10 to 15 cents a cwt.)

A year ago the blended price in January was \$3.91 and trended down to \$3.21 in June. The February Class I-A price for New York is \$5.84 compared to \$4.80 in February a year ago, and \$5.77 a month ago.

**FEDERAL BUDGET:** No one knows exactly what the total federal budget for 1951-52 will be, but figure talked of is 71 billions. Prospective total income is 65 billions (including probable tax increases) which would, if carried out, leave a deficit of around 6 billions.

Of each tax dollar it is figured that 58 cents goes for defense, 10 cents for foreign aid, 5 cents for indirect defense costs, 15 cents to pay for past wars or a total of 88 cents of each dollar for past and future wars, leaving 12 cents for other government expenses. But don't let politicians tell you that the cutting of non-defense expenses is unimportant.

**POTATOES:** Stocks of salable potatoes on January 1 were 161 million bushels, 10 million bushels above last year and the largest on record. Growers have indicated their intention to cut 1951 acreage by 14 per cent.

**QUOTES:** "Controls and more controls can only result in a bigger and better black market. It will be bigger because of the 'know-how' gained during World War II, the enormous growth of home food storage facilities, and the lack of patriotic spirit which acted as a check upon black marketing during last war."—Allan Kline, president of the American Farm Bureau Federation.

**LATE?** Before this issue went on the press, we were seriously delayed by slowness in deliveries of mail and supplies. As we go to press, the strike situation is still uncertain. If your issue arrives late it will be due to conditions beyond our control.—Hugh Cosline.

## The Song of the Lazy Farmer

MOST salesmen beef quite bitterly that they can't sell a thing to me; but just the fact that I don't buy is not what puts red in their eye. What really gets 'em all upset is I act like a first-class bet; I listen with a lot of zeal while they are goin' through their spiel, I do not make a single sound until each one is all unwound, and then I question him awhile and pretty soon he starts to smile, then opens up his order book because he's sure I'm on the hook. Instead I say, "That's int'resting, but I don't think I'll buy a thing."

My neighbor, on the other hand, will waste no time but just demand: "How much?" and then, if it sounds fine, he signs upon the dotted line. That's foolishness, if you ask me; of course, I'm willing to agree that neighbor's calves are better fed, he never finds a pig that's dead, he plants a better brand of seed, his pullets never get off feed; and tho he buys more stuff in sacks, he pays a higher income tax. But still he is a lonely guy because he is so quick to buy; and with so much less visiting, he has more time to work, by jing.

# Introducing PENDISTRIN\*

## "No Frozen Silage Problems with the HARVESTORE!"

says Farmer Herman Kortz  
Kaukauna, Wisconsin

"I have no frozen silage problems with the HARVESTORE. That's important up here where I live." Even in the toughest winter weather, thanks to the revolutionary design of the glass-surfaced steel HARVESTORE... the sun's heat rays are continually absorbed by the silage.

**Silage delivery** is smooth and positive with the mechanical bottom unloader. No more hazardous climbing in blustery, freezing weather!

**Why not find out** what HARVESTORE can do for you—at work on *your* farm? Mail coupon for full information.

**STOPS WASTE!** Seals out air. Prevents spoilage of silage. Preserves carotene, essential food elements. Gives finest quality silage with "green pasture" food values.

**SAVES LABOR!** Mechanical bottom unloader. No daily climb. And no maintenance—no painting inside or out.

**NO FREEZING PROBLEM!** HARVESTORE delivers feed in any weather!

**PROFITS PLUS!** HARVESTORE is the key to a new and better system of farm management. Makes summer feeding practical. Means better herd health. More milk—more beef—more dollars.

## Dairymen's League Says Nation's Food Needs Being Ignored

THE BOARD of Directors of the Dairymen's League Cooperative Association recently adopted the following statement explaining how the nation's food needs are being endangered, and recommending corrective measures.

Many farmers, particularly dairymen, at the beginning of the 1951 crop season are confused, discouraged and distressed by the lack of government attention and planning necessary to assure the all-out food production essential in the present and prospective long-time national emergency.

These farmers note that the government enlists experienced and skilled men of industry to speed up and maintain war material production. They are shocked at the government's listless and inattentive attitude toward the problems of food production.

Farmers are ready and willing to repeat their unequalled performance of World War II, which gave our civilians and armed forces eating standards above all other nations, and also helped to supply our allies. Farmers know they cannot repeat those accomplishments unless their manpower, mechanical and income requirements are supplied, and they are assured freedom from the crippling handicaps imposed upon them during the last struggle.

### Inaction Discouraging

Many farmers are aware that the nation's food needs are being ignored. This is evident in the fact that farmers have not been assured that they will be able to retain or obtain necessary and competent labor.

Additional evidence that the nation's food needs are being ignored appears in the disregard of farmers' machinery, equipment and supply requirements. Mindful of the trouble and difficulties they experienced in the last war because there were too few replacement parts and not enough new machinery, farmers are alarmed by the lack of practical consideration of their problems. They also remember the productive hours that were wasted chasing from one bureau to another for permission to buy a tire, a pair of boots or some other necessity.

### Beef-Milk Prices Out of Line

Further evidence that the government is ignoring the nation's food needs, particularly the most essential of all foods, milk and dairy products, is the alarming rate at which dairy cows are being slaughtered. In comparison with beef prices, the price of milk is destructively low. Good dairy cows and heifers are being sold for butchering because the beef-milk prices are out of line. This is endangering the milk supply. Cows cannot be replaced overnight. It requires years to breed and bring cows to productivity.

That the nation's food needs are being ignored is further indicated by the government's misleading assurances to the public that there will continue to be plentiful food supplies. A year ago there were large surplus stocks of some foods including certain dairy products. Awareness of those surpluses has lulled consumers into a false sense of security. During the last few months those stock piles have been rapidly depleted.

### Subsidies A Fraud

Perhaps the most dangerous indication that the nation's food needs are being ignored is the idea of subsidies to farmers as a means of maintaining food production and providing it to consumers at low cost. Subsidies are a fraud upon both consumer and producer. Subsidies generate among consumers a false sense of the value of food. Subsidies mislead consumers into believing that the price they pay for food

is the real and only price. Instead they actually pay a higher price, but pay part in taxes, including the exorbitant and unnecessary cost of bureaucratic administration. Subsidies are detrimental to the nation and threatening to the food supply because they must be accompanied by government control and regulation distasteful to free men. They cast farmers in the role of receivers of government charity. They are destructive to our free enterprise system, and a step toward the dictatorship of life and business which we are arming to prevent.

### Recommendations

In view of these conditions, which constitute a threat to our nation's welfare and a breakdown of national defense, the BOARD OF DIRECTORS of the DAIRYMEN'S LEAGUE COOPERATIVE ASSOCIATION hereby submits these recommendations:

1. To the extent that government powers are used to control and direct production and distribution, we recommend that non-essential consumer goods and services be reduced so that labor thus employed can be freed for essential industry thereby lessening the drain upon the limited supply of skilled, experienced and capable labor available to agriculture. Intelligent people can be depended upon to recognize that eating is more important than being amused, catered to or being supplied with luxuries.

2. We recommend that the government request the assistance of the nation's experienced, practical and recognized farm leaders to aid in formulating positive farm policies and workable plans to maintain food production at adequate levels; and, that all government agencies be instructed to cooperate with such experienced farm leaders.

3. We recommend that experienced and practical farm leaders be placed in positions where they can apply their knowledge of farm needs to the allotment of scarce materials—steel, rubber, tin, metals—materials of whatever nature required to keep farms operating. And, that men of this type also be placed in positions where they can act to assure full supplies of farm machinery and equipment replacement parts, which are often more important than new machines.

4. We recommend that all thought of subsidies to farmers be abandoned. If costs of things farmers have to buy remain within reason, and speculation in food commodities is prevented, prices for farmers' products will not be unreasonable. If, however, government insists that there must be subsidies, we recommend that the subsidy be bestowed upon the real beneficiaries, the consumers. This should be done by a means that will show them that the government is contributing to payment of their grocery bill by a plainly labeled food subsidy addition to the wage and salary checks of those benefiting.

LATE COMER

"Please Call Me Ahead of the Rest, Mother Dear, For Though I Come Fast As I'm Able At Breakfast And Luncheon And Supper, Alas—I Always Must Take Second Table!"

It's forward-mounted...it's clutchless

# McCormick CORN PLANTER

The **ONLY** planter with  
**ALL** these 10 features:

**1. Fits your Farmall C, H, M or MD**... for drill, check-row or power hill-drop planting, whichever suits your soil and field conditions.

**2. Clear Vision.** You watch the planter without taking your eyes off the marker furrow... get *straight rows* for high speed cultivation.

**3. Fertility-Level Planting.** Match the number of kernels you plant per acre with the soil fertility level of each field.

**4. Accuracy at High Speeds.** Precision-built planter has own ground drive to keep seed plates turning smoothly, continuously; plate cells always fill and always drop seeds at *exactly* the rate you choose. Even spacing in the row assured.

**5. Effortless Hydraulic Control.** A slight push or pull on the Farmall Touch-Control lever (on the Farmall C), or the Lift-All (on the H, M, or MD), is all it takes to raise or lower the planter.

**6. Plants All Types and Sizes of Seeds**... from small tomato to large lima bean seeds, as well as all varieties of seed corn. Three types of plates. Choice of many different seed cell sizes.

**7. Accurate Cross-Check.** Move adjustable check-heads forward or backward, depending on tractor speed.

**8. Furrow Openers for Every Soil Condition**... full-runner, stub-runner, single-disk or double-disk. Special blade and disk furrowers and gauge shoes also available, as needed.

**9. Rubber-Tired Press Wheels (optional).** Assure more uniform planting depth. In dry soil, they help firm the ground, help speed germination. In wet soil, they help cover seed better.

**10. Dual-Purpose Fertilizer Units**... Can be used either on planter or cultivator.

**You Plant Accurately at High Speeds.** Drill or hill-drop 30 acres a day, check-plant up to 22 acres a day, with a McCormick No. 220 forward-

mounted planter on your Farmall. Ground-driven, clutchless planting units are *precision-built*, to give you even spacing, planting depth and rate.

**You Plant Straight Rows**... or follow contour lines exactly... for faster, easier cultivating. You see your work, where you're going, what you're doing. Easy steering and instant-responsive controls give you *complete mastery* of the planting job.

**You Get Faster Germination.** Rubber-tired press wheels help cover and firm the soil around the seed, help speed germination, assure a more uniform planting depth and rate.

**Planter Is Easy to Put On.** McCormick forward-mounted planters are built in two easily handled sections. No heavy lifting... just wheel each section into place, slip the slotted connections over the bolts, and tighten. Then attach the hydraulic control linkage and you're ready to plant. Mounting is snug and secure. Planter and tractor are a self-contained, self-propelled, easy-to-handle unit.

**Fertilize While You Plant or Cultivate.** Fertilizer units can be left on your tractor and used with your cultivator. Quickly attached with quick-change brackets. Hoppers have 65-pound capacity, deposit from 45 to 1000 pounds of fertilizer per acre.

See your International Harvester dealer *first* when you need new planting equipment. His line is complete... includes vegetable planters, beet and bean planters, corn planters of many kinds and sizes.

## INTERNATIONAL HARVESTER

International Harvester Builds McCormick Farm Equipment and Farmall Tractors... Motor Trucks... Crawler Tractors and Power Units... Refrigerators and Freezers

## Semi-Solid "E" EMULSION has them all!

There's no question about it—when you're raising poultry to make a living you have to be careful to feed your flock right. There's nothing scrawnier than the profits from a scrawny flock of chickens. So no wonder you're concerned about your poultry ration. And no wonder you're confused, too. Without a laboratory, how do you know whether your ration has Vitamin B, for instance. You could stare at a bag of feed for hours and never see a vitamin!

That's why we say feed your chickens Semi-Solid "E" Emulsion and relax! Semi-Solid has everything chickens need as a supplement for their mash and grain. To begin with—Semi-Solid "E" Emulsion is made mainly from nutritious Semi-Solid buttermilk. (You know yourself that milk is nature's most nearly perfect food!) But Semi-Solid goes buttermilk one better. It adds even more vitamins,

more minerals, more carbohydrates and protein—nutrients a chicken needs to grow fast... stay healthy... lay quantities of big eggs.

You just can't go wrong on any good ration if you feed Semi-Solid "E" Emulsion, too. If your mash lacks Vitamin B—your chickens get it in Semi-Solid. If it doesn't have enough APF—Semi-Solid has plenty! If it's minerals, Amino Acids, Vitamin D that are lacking—don't worry. If you feed Semi-Solid "E" Emulsion, too, your chickens will get all they need.

Try it! Just feed Semi-Solid "E" Emulsion, too and see your birds grow fast, stay healthy, lay heavily. See your profits jump! Go to your hatchery or feed store for a supply today.

**Consolidated Products Co., Danville, Ill.**  
Makers of Semi-Solid Buttermilk, Emulsions and Kaff-A  
Division Offices in  
Princeton, N. J. • Des Moines, Ia. • Sacramento, Cal.

### Fits any Feeding Plan!

**Controlled feeding?** Just pour a "ribbon" of Semi-Solid over the mash or sprinkle a mix of Semi-Solid and grain in front of the birds.

**Cafeteria style?** Use the handy self-feeding box. Chickens sharpen their appetites while getting the extra nutrients they need.

No matter  
what else  
you feed

Feed Semi-Solid "E" Emulsion too!

## HARRIS SEEDS

AS EASY TO GROW AS ZINNIAS

Top winner in the All-America competition, this new annual flower is going to brighten many gardens next summer.

Brilliant orange-scarlet blossoms with a warm yellow center are often three inches across and borne on long stems. The plants grow waist-high and thrive in hot, dry places. Try it for an inexpensive, temporary hedge. Use it for a striking background for lower growing annuals.

Illustrated in color in our 1951 catalog.

A bird's-eye view of our concrete barnyard

## How We Made a Soil-Cement BARNYARD

By MARK ROBINSON  
*Pennsylvania Dairyman*

ONE requirement for our cold pen-stable with outside roughage feeding was one hundred square feet of paved yard per cow. Including the truck driveway through the feeding rails and three cattle entrance and exit lanes, this made an area totaling 15,000 square feet. We had to plan on paving one-third of an acre. The expense of conventional methods of paving so large an area made us investigate carefully all methods which might prove cheaper. We had heard of soil-cement, which was developed to hard-surface airfields cheaply during the war.

We consulted the Portland Cement Association, 33 West Grand Avenue, Chicago 10, Illinois, on the use of soil-cement for our barnyard. They are an excellent source of information to farmers on cement work. They put out several booklets which list all the tricks of the trade. In my opinion, however, the buildings and layouts they recommend are out of date. They are specialists in cement, but not in farming. The Portland Cement Association was most helpful. They sent us a great deal of information, and a field representative made an on-the-job consultation.

The final recommendation of the Portland Cement Association was against the use of a soil-cement barnyard and in favor of conventional concrete paving. They felt we did not have the proper tools for the job. We would need a Seaman Tiller for mixing the cement into the ground; a Sheepsfoot Roller for deep compaction of the soil; and water tank trucks to supply the necessary water. In addition, they feared that our plan of scraping the pavement with the snow plow on a jeep to remove the manure would peel off the top waterproofing layer of fine cement. This would open the paving to moisture seepage, which might heave and break it during our severe winters.

### We Experimented

Although they did not say so, I am sure that our own inexperience was against us in their opinion. As an official body, they had to be conservative, we realized, and could not recommend something which was not sure of success even though the chances were good. We decided to do our best to overcome our handicaps and try a soil cement barnyard.

We felt that we could mix the cement with the soil by thorough harrowing with our heavy duty spring tooth or orchard harrow. We hoped that thorough cultipacking would substitute for

the Sheepsfoot Roller. We had a heavy duty waterpump, and could reach the whole area with a hose instead of using tank trucks. We also planned the work for the first week in May when the natural moisture level would be high. We thought the Portland Cement Association had entirely too much respect for what a jeep with a light snowplow blade would do to the surface.

After consultation with a number of experienced concrete men about this question of surface damage from the blade, and water penetration, we learned that all concrete absorbs moisture. It is more of a question of the rate of absorption against the rate of drainage away underneath, so that water does not accumulate in and under the slab. Accordingly, we hauled river bottom fill and spread over the area to provide drainage. This meant that we were working with a very well drained gravelly soil rather than our poorly drained clay.

### Expert Help

Having made our decision on our own responsibility, the Portland Cement Association continued to be helpful. They recommended Air-Entrained Cement. As I understand it, this holds tiny air bubbles after hardening and gives a more resilient slab which will bend more than ordinary cement before breaking. They recommended that we use one bag to six-foot square, or thirty-six square feet. They also suggested that we pour a test block, and test it before pouring the whole job.

We made up one six foot square block. To test it; we had a heavily loaded ready-mix concrete truck, which was pouring our barn foundations, drive over the block. To our surprise, the block stood it. We were ready to go. In purchasing our cement, we made an arrangement with a local man to buy a cash car which we would unload and haul. This amounted to slightly over \$500 and was substantially cheaper than the regular price.

As is usual with farm work, the car of cement arrived when it was not expected, earlier this time. We planned to spread the cement over the barnyard directly from the car to reduce handling. One truckload of bags was scattered around the barnyard when a shower came up. We hastily reloaded the bags on a truck and drove them under cover. After the shower passed, we went at it again. To get a thorough job, we opened the bags and spread them by hand. Then we harrowed very

## Bargaining Agency Suggests Order Amendments

IN SPITE of unfavorable weather, attendance at the delegate meeting of the Metropolitan Milk Producers Bargaining Agency at Syracuse on February 1 and 2 was good. The meeting was called as a result of an invitation sent by the U. S. Department of Agriculture to interested groups asking for suggestions for amendments to the Milk Marketing Order.

While the Bargaining Agency will make some other suggestions of a minor nature, the most important one from the producer's point of view concerns the provision for encouraging fall production.

At present in the Order there is a provision for seasonal pricing, and along with it there is naturally a change in prices to consumers as the Class I price goes up in the fall and down in the spring. The Bargaining Agency will recommend an amendment to remove these seasonal price changes and in its place to substitute what is commonly known as the Louisville Plan. Briefly under this plan, producers agree to the withholding of either an exact amount per cwt. or a percentage figure of their milk checks during the months of May and June, and to adding this amount to dairy-men's checks in October and November as an incentive to increase production during the short period. The amount to be thus withheld has not been set, but it might be around 20 or 30 cents. The addition to the fall price of course would be larger because there would be less milk produced.

The object of this is to lessen the necessity of frequent changes in prices to consumers. The consumer milk price might still be changed as a result of other factors, but not as a result of the seasonal Class I changes. One reason for this change is the difficulty of getting prices changed to consumers during a period when government controls and price fixing are increased as a result of war or preparation for defense.

— A. A. —

## BILL PROPOSES HEAVIER TAXES ON LARGE TRUCKS

THE New York State Legislature is considering a bill which would revise tax rates on heavy trucks and buses. It was introduced by Senator George Manning of Rochester, chairman of a joint legislative committee which has been studying highway and canal revenue for the past two years.

The bill would provide for increased taxes on the basis of weight of trucks and distance travelled. Thirteen states already tax trucks on that basis, ten other states are now considering such a tax including New Jersey, Connecticut, and Maryland, and another ten states are proposing increases in registration fees for heavy trucks.

The 1951 legislative program of the New York State Conference Board of Farm Organizations recommends strict enforcement of maximum axle weight loads on all motor trucks; a reduction in the maximum weight, if necessary, in line with what is practical and economical in highway construction, and a more equitable relationship between registration fees and road use.

The principle of the legislation introduced by Senator Manning has also been approved by the New York State Federation of Women's Clubs, various taxpayers' organizations, some auto clubs, many New York newspapers, and many local truck groups.

— A. A. —

Security at the cost of opportunity has no value.

gives more than satisfactory results"

"Being a 'doubting Thomas', I wanted to prove to myself that extra elements in the soil aid crops to the extent of producing large enough yields to warrant the small extra cost. So this spring I ordered some of Swift's BLENN.

"I tried BLENN on my soybeans, sugar beets and corn in the same fields that I used regular 3-12-12 fertilizer, and the results were more than satisfactory."

Frank J. Reder, Secretary,  
Bay County Farmers' Co-op  
Auburn, Michigan, Local

Men like Mr. Reder are always looking for something better to help them make bigger, better crops. In BLENN, Swift's specialized crop maker, they find they need look no further for a balanced plant food.

Here's why BLENN works so well. Feeding BLENN to crops is like feeding a good supplement to livestock. The growth elements in BLENN balance the natural plant nutrients in your soil. Then your crops get all essential growth elements needed...and that means higher yields, improved quality, and more money from every acre.

### BLENN is chemically hitched

New process BLENN is made by an exclusive method developed by Swift. Complete mechanical mixing is followed by complete chemical processing. All growth elements in the formula become chemically hitched together in each granule. Growth elements can't separate out as your planter joggles over the field.

### More uniform in 4 ways

Swift's New Process also makes BLENN more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform distribution through your machines; 3) uniform freedom from

caking, lumping, bridging; 4) uniform feeding of your corn and other crops.

You'll want to make sure you get all the New Process BLENN you'll need for your corn and grain crops. Shortage of plant food materials is again a possibility. So see your Authorized Swift Agent or dealer right away and order your BLENN.

\$1.00 for plant food  
brings back \$7.00

It has been found that a ton of plant food applied to a pasture will, on the average, produce 1,000 pounds of beef or 8,000 pounds of milk. Stated differently, each dollar invested in plant food for pasture will return up to \$7.00 in income to the farmer.

To help you grow better grass — America's greatest crop — we have prepared an informative new booklet, "A Guide to Better Pastures." We'd like you to have a copy. Please write to Swift & Company, Plant Food Division, Chicago 9, Illinois, and we'll send your copy on receipt of your letter. This booklet is free!

## SAVE COSTLY SEED ...GET BETTER STANDS

### CASE SEEDMETER DRILLS

#### Paddle-Wheel Agitator

Revolving paddles keep bearded oats and other bulky, rough seeds from bridging. Assure steady supply of seed at Seedmeter. Available as extra equipment.

#### Low and Large Hoppers

Are easy to fill, make long rounds between fills. Strong steel frame resists sagging, keeps working parts in line, prolongs the accuracy of the drill.

#### New Roller Bearings

Available at extra cost for single-disk furrow openers. They reduce friction, help disks turn freely, work better. Need lubrication only occasionally—save much time.

"The Case drill I purchased is almost human. I set it for 10 pounds of alfalfa seed and it sowed exactly 10 pounds per acre. I raised a fine crop of oats this year under poor weather conditions—67½ bushels per acre—much better than my neighbors. I attribute this to the Case drill."—Harvey Laqua.

### Only Case Drills Have the SEEDMETER

There's more difference in grain drills than you might think. To get full yields of grain, full stands of grass, you need Case Seedmeter accuracy to get the right amount of seed in every foot of every furrow. The exact shape of the shallow-fluted rolls, the deep seed cup with adjustable gate, the wide revolving ring, the two-speed drive—all play their part in the amazing accuracy for which Seedmeter is famous. Grass-seed attachment is built with small Seedmeters for same accurate performance.

See your Case dealer now about type, size, spacing and furrow openers to fit your farming. Plan now for better stands, cleaner fields and higher yields for years ahead.

## Northern Neighbors Have Apple Marketing Problems

By E. STUART HUBBARD

**S**UPPOSE the Hudson River and the Northern New York apple growers were suddenly to lose greater New York as a market for their apples. Suppose three-quarters of the trees they have should suddenly be of varieties for which there could be no market except for processing which rarely took one-quarter of the crop. Suppose the growers for generations had enjoyed a safe, assured comfortable way of life without experience in other productive efforts or skills than the growing of apples, packing in barrels and selling through the same channels. And, suppose that most of the apples were grown on family size farms. Such is the case in which the apple growers of Nova Scotia found themselves when war and subsequent economic conditions took the English market from them.

In mid-November I received a phone call from Secretary Sutton of the Nova Scotia Fruitgrowers Assn. asking me to come and discuss with them their problems of soil management and marketing. My experiences and some of the things I learned on this trip to Nova Scotia may be of interest to eastern apple growers.

All through the sessions and in conversation with interested Nova Scotians, even in the song sheets and in the speeches and jokes at the banquet the minor note of near despair in some and the major cord of hopeful determination in others intensified the feeling of urgency in the search for solutions of a problem that must be solved.

This song refers to state aid in tree removal:

"We're growing so much fruit  
We can't ship overseas  
Or sell to anyone  
So we must pull out trees  
We'll clear them off the land  
And chop them up for wood  
But we would like to have the scheme  
That Jimmy said we could.  
Pull out Bens! Pull out Starks!

Do it with a smile  
Save the Mac and Crimson Grays.  
We'll sell them all the while  
Cut them down! Chop them up!  
Pile them to the sky,  
We hope that Jimmy Gardiner will  
Send money by and by."

Much has been done to help a seemingly helpless situation. Where no cold storage space existed, three units now provide over 600,000 bushels with splendid modern storage space. This permits the processors to extend their season and increase their pack. It prolongs the supply of fine apples for home markets. It keeps fine apples until other eastern dominion sections, which have no storage, can use them. It provides the latest in picking facilities and personnel to put up a standard pack, government inspected as packed.

The principal pack is an offset wrapped, sized, counted pack, without bulge, in a box similar to our eastern crate. Fancy and C grades are legal—others go for processing.

Marketing is completely in the hands of the United Fruit Company of the Nova Scotia growers. No one else can sell apples, except that growers can sell from their own premises only to consumers for the consumers' use.

Growers must put their fruit through the packing house where it is blended into the general run, the grower being paid out of the pool on a basis determined by spot selections from his run of fruit. There is much dissatisfaction, also much appreciation of the fact that absolute chaos has been averted. Some growers have paid off mortgages since the plan was adopted. Many have lost their farms. Others are spending more in growing their crop plus removing trees, top working and diversifying than their fruit is returning to them. The "Deductions" are so great, the price so inadequate that too little is left for most growers.

But there is hope of a return to the

(Continued on Page 12)

### A HOMEMADE PRUNING PLATFORM

**T**HE PICTURE above shows a homemade pruning platform on the farm of George and Tom LaMont at Albion, Orleans County, N. Y. According to Tom, a pruning platform has the following advantages:

1. It makes greater use of clippers possible which is a faster tool than a saw.

2. Much of the trimming is done from the outside of the tree where it is easier to judge what limbs to remove.

3. It is easier to do a good job of trimming the outside where pruning is most needed, and there is less of a tendency to cut out all of the centers.

4. It is easier and faster than climb-

ing a tree and moving the ladder.

5. It saves about one half the time of pruning, and is inexpensive, as one can be built out of rough-sawn lumber.

One big disadvantage is that it cannot be used when the snow is deep. However, snow will bother less if the wheels of the tractor and the pruning platform track, or if the platform is mounted on runners.

The platform in the picture is 4 feet wide, about 14 feet long, and about 8 feet 6 inches high. It has two catwalks between 8 and 9 feet long which are 20 inches wide, but which taper to 16 inches at the end. Each catwalk has a 5-foot handle and can be moved either horizontally or vertically.

# THE NEW 1951 CHEVROLET

The Smart New Styleline De Luxe 4-Door Sedan

## America's Largest and Finest Low-Priced Car . . . the all-around favorite of the highways and byways!

### Loaded with power and really dependable!

Plenty of power! Plenty of stamina, too! Chevrolet's rugged valve-in-head engines are ready to go in any kind of weather . . . ready to meet the challenge of the roughest roads. Both the standard 92-h.p. engine and the 105-h.p. engine with Powerglide Automatic Transmission\* are loaded with power and ready to go!

### So economical to own and drive!

Thrift is a Chevrolet tradition. And, on city streets—or on the highways of the nation—this famous Chevrolet thrift goes far beyond outstanding gas and oil economy. For Chevrolet has long been famous for low cost of operation and maintenance. Yes, with Chevrolet, you'll find you save money right from the start . . . throughout the life of the car.

### A beauty that stays beautiful!

Every one of the fourteen beautiful Fleetline and Styleline models has a beauty all its own. And it's beauty that lasts! Handsome, durable Modern-Mode interiors, with beautiful two-tone color harmonies, are built to stand hard wear. And the modern, new styling of Chevrolet's Body by Fisher will be in tune with the times for years.

It's no wonder Chevrolet is America's favorite, for Chevrolet is the car with everything you want. Beautiful modern styling—Thrifty operation—Unmatched riding and driving ease—Ruggedness—Dependability. Chevrolet has them all! And Chevrolet has *new* Jumbo-Drum brakes, too—the largest in the low-price field, for greater safety, greater ease of operation.

But that's just the beginning. For Chevrolet hugs the highway, smoothes out the ruts in the roughest roads. It's such a joy to ride in . . . so easy to handle . . . such a pleasure to drive!

And what a wonderful choice is yours with Chevrolet. Choose standard driving at lowest cost with Chevrolet's efficient, standard Valve-in-Head engine and Silent Synchro-Mesh Transmission. Or—choose the powerful 105-h.p. Valve-in-Head engine with Chevrolet's Powerglide Automatic Transmission\*—the *only* owner-proved automatic transmission in the low-price field.

Yes, it's no wonder that Chevrolet is America's favorite. For Chevrolet is America's largest and finest low-priced car! Chevrolet Motor Division, General Motors Corporation, Detroit 2, Michigan.

\*Combination of Powerglide automatic transmission and 105-h.p. engine optional on De Luxe models at extra cost.

## Help Yourself to Healthy Herds

**CALF-KIT** One pound of Peebles Calf-Kit replaces 8 lbs. of milk, contains 98% milk serum solids, vitamin-fortified to raise big, thrifty calves. Saves you money, lets you sell your milk.

**MASTITIS CONTROL** Use Penstix and Penstix-SM bougies for prevention and local treatment of this destructive disease. Effective, easy to use, individually wrapped in sanitary envelope. 24-page booklet tells full story.

**MILK ROOM HEATERS** Safe, low-cost heat and circulation saves labor and makes dairy work easier. Electromode all-electric heater has thermostat, lifetime heating element. Simple installation. Will heat average milk house entire season for as little as \$14.46.

**BARN VENTILATORS** Fan-Pac ventilators safeguard cattle health, preserve buildings and increase milk production. Dependable unit comes ready to install, has 2-speed thermostatic control. Operates economically. Underwriters approved.

## USE THIS Easy Way TO FARM PROFITS

Our big line of labor-saving, profit-building farm equipment can help you make more money from your farming operations. Our free cata-

log lists hundreds of products made by dependable manufacturers. Write for it today. Folders on above items also available.

# We Made a Paved Barnyard

(Continued from Page 8)

thoroughly, and began to water the barnyard.

The capacity of our pump might have been sufficient, but the capacity of our ordinary sized hose was pitifully inadequate. Even to add a little water to an area of that size was a question of thousands and thousands of gallons. We frantically began to look for tank trucks, because water was necessary to help the cement form a gluecoat over every particle in the slab. We finally found one, and had it pretty well loaded when a tremendous shower came up and took care of the matter. Planning the work for a wet time of year, and the Lord's kindness, had paid off.

The shower worked fine over most of the area, but where the cattle entrance and exits were on a grade, the cement was washed away. These minor areas were repoured later. We now began to roll with the cultipacker. This worked fine to give a rough finish, but was not heavy enough or smooth enough for a smooth finish. We handled the smooth finish by saying that a rough finish would be better anyway so the cattle would not slip. The whole job, including unloading the car, was done in one long day by eight men.

This barnyard is now in the middle of its second winter, and I would say that it is satisfactory. We recently poured a manure pit along one edge of it, and drove the same heavily-loaded ready-mix concrete truck over the barnyard. I was rather upset to see the barnyard give under the truck something like railroad ties under a heavy freight. We have scraped it several times since then and it appears undamaged. I would certainly insist on air-

entrained cement, if only for my peace of mind.

As a result of our experience, I would recommend the following procedure:

For drainage, instead of the expense of hauling in a light soil fill, I would have a bulldozer cut a drainage moat as wide as the blade and three feet deep around the entire area to be paved. Plank bridges could provide the necessary crossings. Our barns have clay floors which are very dry because of the roof overhead and wide drainage ditches cut on the upper side. From the amount of water that runs off our barnyard, I believe that there is little water to be carried off from underneath the slab.

I would plan to spread the cement with a lime spreader. Possibly it could be bought cheaper in bulk, and handled out of a cement car by lime-spreading equipment. A harrow seems to give sufficient mixing. The Petzold Equipment Company, 600 Fifth Avenue, Owego, N. Y., might be able to tell you where you could rent a Seaman Tiller for mixing.

I would use slightly more cement, perhaps one bag to a five-foot square, or twenty-five square feet, for that occasional unforeseen very heavy load. A test block would be cheap insurance of success. For water, you must plan to pour only small areas at a time, if you are going to depend on a hose. It would be more economical to make an arrangement with two or three neighbors owning spray rigs. We were satisfied with the job the cultipacker did in rolling and finishing.

A soil-cement barnyard is a necessity with a pen stable; and a great pleasure with a stanchion barn.

## Apple Marketing Problems

(Continued from Page 10)

British market. Last year England purchased some barrels of apples from Nova Scotia. They arrived in such bruised condition that the British authorities refused to consider Nova Scotian apples this year. However, persistent pleading to Sir Andrew Jones, British Food Minister at Ottawa, (speaker at the banquet) with assurance that this year's new pack surely would go through most satisfactorily, won a trial order of 200,000 boxes.

The price was disastrously low, the order included only small fruit. But the results of the condition of the fruit, the prices at which it sold and the very handsome profit it netted the British government assure very favorable consideration for Nova Scotian apples by the British in the future. An interesting result was that the price rose as the size of the apples increased strongly indicating that Liverpool, at least, wants larger apples and will pay more for them.

The apples displayed in retail stores in Halifax and Kentville were a great credit to the growers and packers. This year's small crop has been insufficient to supply the processors' demand for their products which are marketed in the maritime provinces. Apple concentrate is a major product. Sauce, etc., are made from the processing varieties, largely Ben Davis. Prices for such fruit, however, do not pay growing costs.

In spite of emphatic warnings for ten years that certain varieties are not wanted in Britain or anywhere, most growers still have some trees of these varieties, some have many. Such trees are anywhere from forty to a hundred years old since the climate is mild due to water protection and Nova Scotia's southern location.

Sir Andrew stated most emphatically

that certain varieties and the barrel are not wanted and can never be sold in Britain again. The elimination of such trees is going on at a moderate rate. Lack of money and hopeful waiting for government help in their removal is holding back a tremendous removal campaign.

Where trees are not over 20 years old and healthy, as most trees are, and where money or time is available, such varieties are being top-worked to McIntosh, Cortland, Delicious, red Gravensteins and few others. The orthodox methods where a few branches each receive two scions is used by many. The Australian method, where as many as 120 scions are wedged and stuck into chisel cuts along the length of all the principal branches, while all small branches and twigs are removed, is giving good results. As much as a third of a normal crop may be picked from such trees after two years of scion growth. The tree feels little shock and the size and quality of the fruit is fine.

## FROM THE Editor's Mailbag WHOSE FAULT?

WE were interested to read in the January 20 issue of the AMERICAN AGRICULTURIST an article and accompanying graph entitled "Out of Balance." The graph gives the impression that the canner makes a huge profit at the expense of the grower and others in the canning of applesauce. While the article goes on to explain that it does cost the canner something to do business, it is entirely misleading to the average reader because the impression certainly exists that the canner gets a big bite.

Actually, in checking figures with some of our packers, we found that it cost approximately 7.5c in 1949 to pack a can of applesauce without even figuring in the cost of the apples. We can certainly emphasize without fear of contradiction that the margin of profit to the canner for this product is extremely small and would amount to less than 2% most years.

We certainly hope this erroneous impression might be corrected.—W. H. Sherman, N. Y. State Canners Association, Rochester, N. Y.

—A.A.—

## WHO WANTS AN ENGLISH VISITOR?

I AM 25 years old and the son of a British farmer. I have always been interested in American farming and have for some years read your excellent journal.

I have the long-sought opportunity of visiting North America this coming spring and summer. I hope to see all I can of the northeastern way of farming, as this is the object of my proposed visit.

I am writing to you to ask if you could put me in touch with one or two farmers who would be prepared to lodge me for a month or so for the value of what work I could do for them. My chief interest is in dairying, and I should prefer to see Jersey cattle and to be with a farmer who has a wide interest in American agriculture.

—N. P. Bray, Somerset, England  
EDITOR'S NOTE: Any reader who is interested in Mr. Bray's proposition or

who would like to correspond with him may write to us and we will be glad to forward letters to him.

—A.A.—

## WRITE YOUR CONGRESSMEN

Here is an unsolicited suggestion; namely, in the next issue that you use a page to carry a letter embodying all the sound ideas set forth in the article "The 1951 Farm Outlook" which appeared on the front page of the January 6 issue. My thought is that many of your readers could detach this, sign it, and mail it to their representatives and senators in Congress.—H. M. W. Earlvile, N. Y.

EDITOR'S NOTE: We appreciate the suggestion and take this occasion to urge all readers to write their thoughts and opinions to their representatives in Washington. Unfortunately there is one big flaw in the suggestion, namely, senators and representatives tell us that they pay relatively little attention to anything which is in the nature of a form letter. But they do pay a great deal of attention to personal letters from constituents. No matter how your opinions are expressed, they will have far more weight than signing something which we would write.

—A.A.—

## HENRY TALMAGE 1872-1951

ONE OF Long Island's grand old men of Agriculture, Henry Talmage, passed away recently at the age of 79. For half a century he has been known as one of the Island's good farmers and a man who was ever ready to put in days of hard work for any cause which stood a chance of bettering the agriculture of the State, the Island, or the Nation.

He was one of the first New York State farmers named as a Master Farmer by AMERICAN AGRICULTURIST. That was in 1928. He has served his fellow man as founder and president of the Central Suffolk Hospital, as one of the organizers of the Long Island Cauliflower Association, the Long Island Producer and Fertilizer Company, the Suffolk County Farm Bureau and the State Farm Bureau Federation. He also served as a director of the National Plant Breeding Association and the Northeast Vegetable-Potato Council.

Mr. Talmage is survived by his wife, Mrs. Ellen Wells Talmage, a son, Nat Talmage who has been a partner in the farming business, a daughter, Mrs. Christine Bayes of Shepherd, Michigan, and a sister, Mrs. Carolyn Hulse of Baiting Hollow, L. I.

Miss Bernice Eamer, daughter of Mr. and Mrs. Harold Eamer, Freetown, Tompkins County, N. Y. Bernice was State winner in a Farm Fire Prevention Contest and on January 23 received a \$50 Savings Bond at the State meeting of the New York State Central Organization of Cooperative Fire Insurance companies.

Bernice has been a 4-H Club member for 8 years, and is now assistant leader of the Freetown Farmerettes 4-H Club. This past year she was State alternate winner in the National 4-H Farm and Home Safety Contest.

## New Handling Speed... New Planting Accuracy!

The new full lift type Dearborn Corn Drill Planter gives new planting ease, speed and accuracy—for corn, soybeans and other field row crops.

Speedily attached to your Ford Tractor, Ford Tractor Hydraulic Touch Control lifts it fast at row ends. Lift, and planting stops—lower, and planting resumes. Close coupling and rapid response save time and space on every turn-around, give much more accurate control.

The Dearborn Corn Drill Planter is a real stand getter at practical tractor working speeds. Positive individual seed cut-off, and pressure spring knocker team with accurate edge drop seed plates for more accurate planting. Plants rows 36 to 44 inches wide. Vertical flexibility allows planting at uniform depth in uneven ground, to avoid seed waste, "runty" hills, or slow germination.

### DEARBORN CORN PLANTER

Here's another notable new crop starter—the Lift Type Dearborn Corn Planter, built to check, hill drop or drill corn and other field row crops with simple, in-the-field changes. See your Ford Tractor dealer for full facts on Dearborn Planters.

# Canning Crop Growers Plan Cooperative Bargaining

By L. B. SKEFFINGTON

**A**RTHUR POELMA of Albion, secretary of the New York State Canning Crops Growers' Cooperative Inc., says preliminary reports indicate two-thirds of the state's tomato acreage has been signed with the association. Directors may meet soon to vote into effect the cooperative bargaining agreement, by which the association would deal with processors.

Under terms of the membership contract, once the agreement becomes effective, growers must wait until processors' contract proposals have been approved by the association. "Once approved," he says, "growers may select their processor, decide to grow or not, plant as they see fit and deliver their tomatoes as they always have done. The only restriction is that you wait until the contract is approved. That is where the bargaining power comes in."

The cooperative reports that New Jersey tomato growers have rejected a processors' bid about \$3 higher than last year. In Ohio, growers are asking for \$40 per ton for No. 1 grade and \$34 for No. 2's. Last year the New York price generally was \$28 and \$18. The cooperative also is seeking higher prices for peas and sweet corn.

## Steuben Potato Meet

Bill Stempfle, county agent, announces that the annual Steuben County Potato Convention will be held at Cohocton February 23 and 24. Ralph French is general chairman. A speaker will be Earl D. Merrill, one-time county agent in this state, manager of Forest Farms at Webster, and for years secretary of the Empire State Potato Club. Merrill now is director of agricultural relations for the Republic Steel Corporation, with headquarters in Cleveland.

## Likes Native Lambs

When sheepmen on their annual tour stopped at the farm of Ralph Brundage at Oakfield, he told them he was using native lambs because of the cost factor. Western lambs finish better, he said, but he found the original cost too high. He bought a large number at 63 and 64 pounds and 760 already have gone to market at 80 pounds.

A demonstration included drenching by stomach injection. He said this does not cause the lambs to stop feeding as is the case with worm pills.

## Proved System Best

The State Agricultural Society at its annual meeting in Albany re-elected officers headed by Fred H. Sexauer, president, and asked state and federal governments to "keep their hands and controls off of the productive system" which has proved so effective in the past. It urged that there be no change in the Cole-Ives amendment to the National Defense Act, by which milk prices in non-regulated markets would be allowed to rise to parity before there was any price-fixing controls.

Farmers, farm and food organizations were urged to support to the extent of their ability the campaign to raise a half-million dollars for endowment of H. E. Babcock Memorial Professorship in the School of Nutrition at Cornell University. This chair and its supporting research would carry forward the ideas of the late "Ed" Babcock for promotion of animal agriculture and improved human nutrition.

## Like Brunk Report

E. Stuart Hubbard, president of the State Horticultural Society, and Cameron G. Garman, president of the

Western New York Apple Growers' Association, agree that the report by Max Brunk of Cornell on retail apple merchandising is "just what we have been waiting for."

For three seasons Brunk and associates have made detailed studies of consumer reactions to quality and packages of apples. This past fall they made three-months of continuous observations in four busy stores. In brief, they found that where McIntosh apples are displayed in bulk alone, sales averaged 12.5 pounds per 100 customers. When two-pound transparent bags are displayed with bulk, sales were 13 pounds. Four-pound bags with bulk display increased sales to 20 pounds. Six-pound bags with bulk display moved sales up to 28 pounds. When apples were carefully "faced" in the six-pound bags sales jumped to 33 pounds.

Brunk found most stores were offering apples in three or four-pound bags, but that six or seven pounds was about what consumers wanted—provided they liked the looks of the apples. Hubbard commented: "Some of us have been thinking that we knew best what consumers wanted. This time we have gone to the consumers and found what they want. It is the most effective kind of sales research."

## The Handiest Tool!

Bill Sherman, secretary of the Association of New York State Cannerymen, has come through with another bit of interesting research. He finds that the average housewife uses a can opener 750 times a year.

H. B. Pearson of Alton, state chairman of the annual cherry pie baking contest announced that the winner was Shirley Meahle of Lockport. She will get a \$75 prize and an all-expense trip to Chicago for national finals at the Morrison Hotel, Feb. 21.

The meeting in Syracuse scheduled for Feb. 2 at which Ralph Trigg, PMA administrator and other Washington brass, were to talk over federal milk marketing policies, has been postponed to April 5.

## Turkey Men Optimistic

This may be a good year for turkey raisers, according to opinions expressed at the annual meeting of the New York State Turkey Association in Rochester. H. L. Shrader of the USDA estimated a crop of 45 million birds for the holiday season. He said prices had a chance to rise to parity. Growers figured that with increased employment and competition for red meat supplies, demand should be good. And Shrader said that "even if we raise 60 million birds, this means only two birds per family."

Frederick H. Phinney of Mannsville was elected president. Joseph Nicholson of Hicksville was elected vice president and Mrs. H. A. Koerner of Holland was re-elected secretary-treasurer. New directors are William Miller of Colden, Anthony J. Schreiber of Orchard Park, Russell Ryer of Calcium, Fred Taylor of Cape Vincent, Clifton H. Timmerman of LaFargeville, George Utzman of Waterloo and Guy Rocker of Salt Point.

— A. A. —

## SAVE THE PARTS

When repairing clocks or electrical appliances where a number of small parts have to be removed, keep the parts in order by laying them on the adhesive side of a strip of tape. The adhesive will prevent the parts from rolling or being brushed aside accidentally and lost. Small pieces of tape across the ends of the strip will hold it flat.—Benjamin Hall, Hudson, N. Y.

You will find the booklet on Coleman heating equipment interesting and instructive. You can get a copy by writing to the Advertising Department, COLEMAN COMPANY INC., Wichita 1, Kansas.

THE JAMES MANUFACTURING COMPANY has sold its plant located at Elmira, N. Y., and on January 1 a new plant was opened at Mount Joy, Pa.

Anyone who is contemplating wiring his house or having it wired will find a wealth of information in the latest edition of the Home Wiring Handbook published by the WESTINGHOUSE ELECTRIC CORPORATION, Box 868, Pittsburgh 30, Pa. Because of the considerable cost of preparing this, a charge of \$1.00 per copy is made.

Farmers are showing considerable interest in the new improved wood-burning furnaces. For example, there is the Woodomat developed by the PANTEX MANUFACTURING CORPORATION of Pawtucket, R. I. It is designed to heat 9 moderately sized rooms.

For more than a year men who know tractors have been working to prepare the "Gulf Farm Tractor Guide." It is chuck full of information and it is yours for the asking. Just drop a postcard to the GULF OIL CORPORATION, Domestic Marketing Dept., Gulf Building, Pittsburgh 30, Pa.

The BEACON MILLING COMPANY of Cayuga, N. Y., has just completed and printed the 19th edition of "Profitable Poultry Management." The booklet has been revised; new material has been added and, as always, it contains a wealth of information for poultrymen.

If you are planning to drain farm fields, you will find valuable information in the "Farm Drainage Handbook" which our readers can get without charge by dropping a postcard to Edward C. Milliken, General Manager, THE BOWERSTON SHALE COMPANY, Bowerston, Ohio.

TWELVE FULL QUART BOTTLES can be stored in International Harvester Company's new 9.2-cubic-foot refrigerator for 1951. Cold to the floor, Model HA-92 has 18 square feet of stainless steel shelves, plus nearly eight feet of front-row storage space provided by the "Pantry-Dor." Two crispers—one full-width—have a total capacity of more than 23 quarts. A full-width freezer locker stores 50 pounds of frozen foods, and a covered meat drawer holds almost 11 pounds of meat. Butter-keeper in the door has a separate temperature control for making butter the desired consistency for spreading. Bottle opener built into the door latch is magnetized to hold on to caps after removal.

## It's Handy

### MOVING LOGS

A neighbor who had a tractor with a fork and shovel hydraulic lift, and 10 thousand feet of logs to load onto a truck, secured two pairs of log tongs—the kind lumbermen use to draw or snake out logs with, which look and work like ice tongs. He fastened these on opposite corners of the shovel. To make the tongs farther apart for longer logs, he bolted a hard wood plank or scantling from the shovel or lift, then he fastened a pair of tongs onto each end of the stick. He then hitched a pair of tongs on each end of the log, raised it up with the power lift, ran the tractor in place so as to deposit the log on the truck, then repeated the operation.—*Ralph A. Warner, Route No. 1, Greene, N. Y.*

— A. A. —

### FOR DOOR-PLANING

When edge-planing doors before hanging, time can be saved by holding them securely with a simple stop made of scrap lumber, suggests American Builder magazine. The door stop is made by cutting a V-shaped notch, three inches wide at the mouth and 12 inches long, in the piece of wood. Then it is tacked to the window sill, as shown in the illustration, with two thin casing nails.

— A. A. —

### AN EFFICIENT METHOD OF BURNING BRUSH

Most farmers have plenty of old feed bags, empty phosphate and lime bags and plenty of bale wire or string lying around. I wrap these bags as tightly as possible, tie them with bale wire and soak them in old motor oil and kerosene. This little bundle will start like a flash when lighted and burn a long time, and it can be carried from one pile of brush to another. I usually take along about six bundles for a half day's burning. I carry them around in a large pail with oil in it. If the brush is green, I use an old tire to help out, as this combination will burn anything that is wood, and is not dangerous.—*John M. Meredith, Wallkill, N. Y.*

— A. A. —

### HANDY STARTING IDEA

Here is an easy time-saving experience when my car would not start because it did not get the fuel up to the carburetor. I had a friend remove the gas tank cap and press his mouth tightly to the filler pipe and blow hard while I used the starter. I was surprised how quickly the gas reached the cylinders and started the engine. Since then I have helped others start their engines in the same way.—*I.W.D.*

Contributions for this page are welcome and those that are used will be paid for at the rate of \$2.00 each. Sometimes a rough sketch of the labor-saving gadget helps to explain the idea. Ideas sent to us will not be returned except on request. Send ideas to IT'S HANDY, American Agriculturist, Box 367, Ithaca, N. Y.

# My Experience With *Birdsfoot Trefoil*

By **GEORGE H. SERVISS**

**H**AVING been considerably involved in the promotion and evaluation of birdsfoot trefoil at a time when the interest of agricultural workers and farmers was first being focused on this crop, I thought it might be of interest to write a short historical account of my experience with the crop before I lose all of my notes.

I didn't discover the crop, nor do I know who did. It is listed in some of the old weed manuals, so it was identified by the botanists several years before I first saw it. My attention was first called to it by Professor D. B. Johnston-Wallace, who had known it in England and who had observed the narrow leaf variety growing in several fields in the vicinity of Claverack in Columbia County, New York, about 1933. The late Professor John Barron had also observed the narrow leaf variety at several locations in Greene County.

The Broadleaf variety I first observed on the farm of William Bateholts in Albany County. One afternoon during the summer of 1935 or 1936 I was walking across a pasture field in company with Walter Mason, then assistant county agricultural agent. There was only a thin scattered stand of plants and no one would have gotten very excited over what was to be seen. It did, though, serve the purpose of identifying the plant to Walt Mason, who was to play a very important role in the birdsfoot picture. Either that year or the spring of the next, Walt located an appreciable acreage of natural stands.

## Drought Resistant

It was doing so well that it seemed almost certain we had a legume that would eventually play a very important role in our pasture program and possibly also for hay. It appeared to be as drought resistant as alfalfa, and stood close grazing about as well as wild white clover. At that time we had no idea of how important a crop ladino clover would become. If we had, we might not have become as enthusiastic about birdsfoot as we did. But research and farm experience have indicated that we need both of these crops in our forage program in the Northeast. We originally thought of birdsfoot chiefly as a pasture crop. It is now clear that it also should fill an important role as a hay and grass silage crop.

It was evident from the start that there was considerable variation within the crop. There were upright types, sprawling types, broad-leaf, narrow-leaf, etc.

## Threshing Seed

The next step was to get sufficient seed for experimental purposes. Mr. Mason persuaded Leland Cook of Preston Hollow to cut a couple of loads at the proper stage for threshing. One of the best natural stands was located on his place. One day in late October or early November in 1937 (it could have been 1936) we threshed this seed. None of us knew anything about threshing birdsfoot and it was a slow process. Those helping with the threshing were Leland Cook and his sons, Walt Mason, F. O. Underwood of the G.L.F.'s Seed Division, and myself.

The second man to thresh any seed, so far as I know, was Charles Goodfellow at Helderburg Lake. Like many others, he knew it made good hay but did not know what the plant was. Up the valley in what once must have been a pasture or hay field, more birdsfoot

An excellent stand of birdsfoot trefoil in bloom. The field is on heavy hilly land in Tompkins County, N. Y.

was found that had apparently not been mowed or grazed for several years. It was not long before Mr. Goodfellow had birdsfoot established on many of his other fields.

## Birdsfoot Pasture

David Beresford, manager of one of the Gage stock farms, had started, somewhat before this time, considerable work on pasture improvement. In one of his heavily grazed permanent pastures there was considerable birdsfoot that had attracted his attention. Being experimentally minded, Mr. Beresford harvested sufficient seed for a small plot in a new seeding he was making; also, through some source, he obtained a small amount of European seed for comparative purposes. He was one of the leaders in the organization of the Eastern New York Birdsfoot Trefoil Cooperative.

In just a short time, many farmers in the Preston Hollow area were producing seed. Some that we remember quite well were Mrs. B. D. Arnold, William Lorrett, and Messrs. Heneka, Clements and Burhans. The largest acreage of any of the natural stands in the county that I saw was on Mrs. Arnold's farm. It really thrived on this farm.

Natural stands of the broadleaf were not confined to the Preston Hollow area. Some excellent ones were in the Feura Bush area. On the Sam Haswell farm was one of the best permanent pastures I ever saw. It consisted of Kentucky bluegrass, birdsfoot trefoil and wild white clover; none of which were ever seeded. There were also stands on the Corning farm and on the dairy farm then operated by William Taylor, just west of Albany. There were, of course, natural stands on many other farms, some of which I visited and many that I was not on. Due to incomplete notes and lack of memory, I have missed some who should be mentioned, and make due apologies. Soil Conservation Service personnel, then located at Gallupville, deserve considerable credit for their work with the plant.

## Lime and Fertilizer

One of the outstanding jobs with the plant was done by Hubert Miller of East Berne. None occurred on his farm at that time, but today it is practically solid birdsfoot. At that time he was struggling with alfalfa with only fair

success. The soil on this farm is derived from limestone and needed little, if any, lime to grow alfalfa, but the drainage was not quite good enough. Mr. Miller was a very liberal user of phosphate fertilizer. In fact, his farm had been selected as a phosphate demonstration farm under the TVA program. So far as I know, he has never had a seeding failure with birdsfoot trefoil, and he always cut a fair yield of hay the year after seeding. I attribute a large part of this success to adequate lime in the soil and, for that period, liberal use of fertilizer.

Early in the period in which interest was developing in Albany County, birdsfoot was also discovered in Essex County. On the heavier soils of that county which were well supplied with lime, it thrived. County Agent Ray Bender was quick to realize its potentials, and it was not long until acreage increased to the point where Essex County farmers had seed for sale. I was not in close touch with developments in this county, so can give no further details. The Cornell agronomists who worked with Mr. Bender were Professor E. L. Worthen and Dr. E. Van Alstine.

## Research Started

Really organized research with the crop began in the fall of 1938 when H. A. MacDonald, then a graduate student in the Department of Agronomy at Cornell University, took up the study of the plant as his thesis problem for his Ph.D. Dr. MacDonald has continued to do intensive work with birdsfoot ever since. One of the things he soon discovered was that the narrow leaf and the broadleaf were distinct species rather than mere varieties.

In either 1939 or 1940, Robert Greig, then assistant county agricultural agent in Columbia County, found a small field of an extremely broadleaf, very upright and very early flowering type on the Mack farm near Hudson, New York. This appeared to have considerable promise for hay purposes. Some seed was obtained which was seeded at Ithaca on the Agronomy experimental field by Dr. MacDonald. The seed has recently been multiplied and there is a good possibility that it will soon be released for commercial multiplication.

A year or two later Dr. Esseltine, who owned a very large farm a short distance south of Hudson, became very

much interested in the crop. Much of the land on this farm was rolling and quite subject to erosion when plowed. His farm manager had had considerable experience with birdsfoot while manager of the Corning Farms near Albany. Dr. Esseltine had little difficulty in obtaining stands and soon had a large part of the farm in trefoil. I remember Dr. Esseltine did not spare lime and fertilizer to get the crop.

## In the Finger Lakes

Small patches were found in other parts of the state from 1939 on. Bill Allen, County Agent in Yates County, discovered about a five-acre field near the top of South Hill. It was the narrow leaf type and was doing remarkably well on a field that once had been badly eroded. Ralph Morgan, County Agent in Genesee County, found a small patch of narrow leaf near Darien and about one-half acre of broadleaf at East Pembroke. I was unable to trace the history of the Darien stand, but the East Pembroke patch had been seeded at about the time I first noticed it in Albany County. The farmer who owned the land (sorry I have lost his name) operated a large apiary. He had taken an automobile trip east that took him through the Preston Hollow area at the time birdsfoot was in full bloom. He noticed that bees worked the flowers exceptionally well and he collected some seed pods. When he returned home, he seeded it and soon had an excellent stand.

In 1938 some seed was available for trial use on small plots around the state. A substantial number of these were seeded on top of permanent pasture sod in the early spring without any seedbed preparation. Only a very small percentage turned out successfully when seeded in this manner. The best I saw was on the Albert Harrington farm in Niagara County.

## A Slow Starter

In 1941 and 1942 the extension agronomists at Cornell (at that time I was one of them) in cooperation with county agricultural agents and farmers, put out 240 demonstrations comparing ladino clover and birdsfoot trefoil with the farmer's own seeding mixture. The ladino clover was added to the farmer's regular mixture at the rate of one pound to the acre. The birdsfoot was seeded in mixture with timothy only. The year after seeding, the results were heavily in favor of ladino. By the third year after seeding, though, the birdsfoot trefoil plots averaged by far the best.

The great majority of the plots were seeded in hay fields and managed for hay. Some were cut early and some late; some were grazed after haying and others not. While I did not see them all, I did observe those I was responsible for. The management definitely favored the trefoil. Ladino showed up best where haying was early, where the aftermath was grazed, and where they were used for pasture throughout the year. These plots definitely established the need and place for both crops.

Following this demonstration program, many county agricultural agents became enthusiastic about the crop, and seeded acreage was limited only by the supply of seed, which for many years has been totally inadequate. W. E. Washbon, then county agent in Schuyler County, probably conducted the most outstanding program outside of Albany-Essex County areas. Two of the first farmers in that county to establish substantial acreages were Alton Culver and James Hazlett. Since then, Wally moved to Cattaraugus County where he has continued to work actively with the crop.

Mention, too, should be made of the work done by C. F. Crowe, then assistant county agricultural agent in Erie County. "Cy" had some outstanding demonstrations of the crop. One of the

Director, Research Dept.

## Razorback Sows Have Big Litters When Properly Fed

Last spring 8 typical razorback sows were bought way back in the Ozark hills. The heaviest sow weighed less than 225 lbs., the lightest 112 lbs. All had farrowed at least once, but not one had ever farrowed more than 6 or 7 pigs.

At the Research Farm they were bred, then were fed a conditioning ration of Purina Sow & Pig Chow and grain. During gestation they gained an average of 225 lbs.

Ozark sow on arrival at farm

Same sow before farrowing last fall

At farrowing time last fall one sow had 15 pigs. The smallest number was 9, with an average of 12. There weren't enough "faucets" for all, but the 8 sows took care of 72 pigs, while 6 others were raised on bottles.

You'll want a complete report on these sows and their litters a little later. Already this work has shown what can be done with ordinary stock on an ordinary farm where the Purina Hog Program is followed.

## Birds Bred for Meat, But Lay Well, Too

The New Hampshire flock at the Research Farm is from a strain bred for meat, but records show they can lay, too. From 5 months of age through 6 full months of laying these pullets averaged 58.2% production, without one bird being culled. Throughout this period the eggs averaged 93% fertile, with a hatch of 86.6% of all eggs set.

## Produces Eggs for 21c a Dozen Feed Cost

**540 pullets average 71.2% lay on a hen-housed basis for full year on Schoharie, N. Y., farm**

**C**HARLES BURMAHL has made a point of keeping complete records on all his laying and growing birds. These show some corking results.

From September 20, 1949, to September 20, 1950, 540 White Leghorn pullets of high egg laying strain laid 140,751 eggs, a hen-housed average of 71.2% for the complete year. Total cost of feed, sanitation, litter, and grit amounted to \$2473.51. It cost him, then, only 21c a dozen to produce eggs, not figuring in his own labor and cost of pullets.

At the end of the first year, he culled the flock completely with the help of the Purina Dealer's free culling service. 306 of the original birds are being kept over for a second year. In October they averaged 61.1% production with no signs of molting.

Charlie has been keen to pick up all the tips he could on better

feeding and management and put these into practice. Here are the ones he says are chiefly responsible for his success:

1. Feeds Purina Lay Chow and scratch grain, half and half. Is extra careful to give his birds all they'll clean up but makes sure there's no mash left over when he feeds next time.
2. After the birds reach 60%-70% production, he top feeds

Charles Burmahl and Purina Dealer, Harold Scott, check feed consumption and egg production often to see whether the birds are earning their board and keep.

Purina Layena Checkers. This is how he gets more feed into them when they need it.

3. During cold snaps or whenever the birds threaten to go into a molt, he steps up Checker feeding to prevent a slump.
4. Uses fluorescent lights, giving his layers an 18 hour day when daylight is short.

Planning to increase his flock this year, Charlie started 920 pullets in March, 1950, raising them on Startena and Growena Checker-Etts. He noticed that his pullets liked the extra palatability of the Checker-Etts, consequently ate more, grew faster, and wasted less feed.

These March pullets laid their first egg at 18 weeks and 1 day. By July they were up to 10% production, August 23%, September 68%, and October 75%.

Two years of good profits have convinced this poultryman that it pays to take a lot of pains with feeding and caring for growing and laying birds.

# FORMULA '1028'

STEPS UP PURINA'S STARTING AND GROWING CHOWS FOR CHICKS AND PULLETS FOR 1951

Faster growth from chick to 5 weeks on Startena with "1028". Bigger, better-developed pullets by laying time on Growena with Formula "1028."

Ever since the earliest scientific discussion of the miracle growth promoters, variously described as Antibiotics, Vitamin B<sub>12</sub> Supplement (formerly APF), and Growth Vitamins, these products have been under test in Purina Laboratories and at the Purina Research Farm.

## HOW PURINA RESEARCH DEVELOPED

## FORMULA "1028"

...AND WHAT IT MEANS TO YOU

by Wm. C. Sherman, Ph. D.  
Head, Purina Biology Dept.

The Antibiotics, Vitamin B<sub>12</sub> Supplement, and Growth Vitamins are very complex in their action. Chicks respond best to one combination, pullets to another, pigs to another, etc.

As a result of 1028 tests involving thousands of chicks, we have Formula 1028 on which chicks grow faster and feather better than on any formula tested without the

Now, after 1028 feeding tests, "Formula 1028" for poultry is perfected. 571 tests resulted in a perfected formula for pullets. Still other Farm tests conducted in similar detail resulted in special growth formulas for pigs, for growing pullets, and for broilers.

magic promoters. The pullets are bigger. 571 tests with pullets resulted in a formula with startling growth differences. Numerous other tests were with pigs and growing pullets and broilers. Without our knowledge gained from these feeding tests, we might have made mistakes that would be costly to our feeders.

# HOME HANDIES

Cold lard won't clog the blades of your electric mixer if you warm the blades in warm water for a few minutes before starting to mix.

Teach the children to put eggs in the case small side down—always. Tests show that eggs packed small side down grade higher and bring higher prices than those packed incorrectly.

When using foods from your freezer, be sure to leave them in the container until they are completely thawed. Taking them out sooner may cause them to turn dark and lose flavor.

Want to help someone else with your own handy hints—and win \$5.00? Just send your favorite hint right away to Home Handies, Ralston Purina Co., St. Louis 2, Mo., and if it's printed here we'll mail you a \$5 check right away.

# PURINA CHEERBOARD NEWS

## DOES IT PAY TO BUY GOOD CHICKS?

Of course it does. Unless your chicks live and return a fair profit over their cost plus cost of the feed they eat, you will soon be out of the chicken business.

Good pullets are bred to develop quickly and to lay lots of big eggs. Chicks bred for meat must return a high per cent of meat from the feed

they eat. They grow big frames, feather rapidly and grow uniformly.

A difference of just one egg per pullet in a year, or of an ounce or two on a 3-pound fryer, would escape ordinary notice, but it's difference enough to offset the difference in cost of a truly good chick and an ordinary one.

## IT'S EGG PLANNING TIME

By C. DON MUSSER  
Purina Poultry Field Specialist

It's planning time for next fall's eggs, so I'd like to suggest some factors for your special consideration.

Plan to raise every chick. Naturally there will be some loss, but with good chicks, good management and good feed your losses should be small. Many good poultrymen figure there'll be one to cull for each one that dies. Don't keep birds that should be culled, but handle your birds so there will be fewer culls.

Plan for enough pullets. Profits from just one hen are never large. A small flock requires almost as much work as a larger one. Think of each chick as a potential egg machine. Develop her so she'll live up to your expectations.

Get eggs when they count most. You know egg prices in September, October, and November are always good. Get your chicks early and grow them out so they'll be ready. Plan to get all the eggs your birds are bred to lay.

## 14 FIRST-CALF HEIFERS AVERAGE 404 LBS. FAT

In the whole year of operation, the heifers on most farms come in for less attention than any other dairy animal. This is natural, because heifers "cost"—they don't "pay."

Yet research work at the Purina Farm has consistently shown that a small amount of feed and care given the growing stock will "pay" high profits in earlier calving, and in more milk during the first lactation. At the Purina Farm in 1948 we put 14 grade Holstein heifers into the milking herd. Without any special pampering at all, they averaged 404 lbs. fat apiece during their first milking years. All records are 10 months long.

That's an average of 4 gallons per head—almost half a can—a day for the full 10 months! Yet these heifers calved averaging only 24 months old!

The secret of their success is that they were BIG—weighing an average of 1244 lbs. per head at two years old. All it took to grow them big was reasonably good hay or pasture and 3 pounds a day of Purina D & F Chow. This special body feed was increased to 10 to 12 pounds a day for the last 3 months before calving. The extra feed at this time is necessary to keep the heifers growing while developing their calves.

The best way to grow a good heifer is to start with a well-developed calf. We can grow a bigger, harder calf on dry Calf Startena than we can with milk.

Purina Farm heifers are bred by weight (750 pounds for Holsteins, 550 for Guernseys). They grow fast, usually reach these weights by 13 to 15 months.

## SAVE A CALF...

By A. H. LEONARD  
Purina Dairy Field Specialist

Heavy calf mortality has caused the downfall of many a prospective dairyman. Each heifer calf represents a future milker. Consider her loss a calamity that should have been prevented.

### Let Calves Suck At Start

The first milk is laxative, and supplies essential vitamins which help build disease resistance. Let calves suck for 3 days.

### Pen Calves Separately At First

After being penned separately for 10 days several calves can be safely turned together in a larger pen or room.

### Teach To Eat Calf Startena

Teach calves to eat Calf Startena along with a limited amount of whole milk. After the 4th week feed no more milk.

## Readers Comment On PEN STABLES

**T**HERE are at present in New York State 83 dairies with pen stables approved for shipping milk to New York City. A letter to them from Editor Ed Eastman, asking for their comments on pen stabling, brought 37 answers. Many of the comments interested us intensely, and we are sharing a few of them with you:

### HEALTH

"I believe from my experience that I get a longer-lived cow, because she is more contented."—H. R. Sanford, Savona, N. Y.

"We feel that pen stabling has contributed greatly to herd health. We have had three mastitis surveys. The first when we were stanchioning showed 65% clean quarters. A year ago after a year of pen stabling, we had 85% clean quarters; and after 3 years of pen stabling, 97% clean quarters."—Robert and Louis Patrick, Perry, N. Y.

"I believe, but have no proof, that the life of my cows is extended at least two years by pen stabling."—Leo Stanton, Cohocton, N. Y.

"It has been our experience that the older cows that had udder trouble before we pen stabled now have less, and that the younger cows started in a pen stable have very little."—Joseph Hoffmann, Odessa, N. Y.

"I feel that my cows are much better off in the pen than they were in stanchions, as they get more exercise and I have not had any udder injuries since pen stabling."—Norris Wooley, Forestville, N. Y.

"I have two adjoining farms with conventional stables. In one there are forty stanchions in which are kept heifers and some dry cows. In the other there are 26 stanchions filled with milking cows. In those two barns there have been 4 serious teat injuries this winter so far, which have resulted in the loss of 4 good milking cows. In the pen stable in the 5 years there has never been an injury. There have never been more than 53 cows in the pen stable at one time which means that the cows always have plenty of room."—M. H. Mabey, Cuba, N. Y.

"When we used a stanchion stable, our cows had a lot of trouble with mastitis, especially after we started using milking machines. The mastitis, of course, carried on after we started pen stabling, although the pen stable did help some; but you cannot expect a pen stable to correct a faulty milking machine or faulty milking methods. About a year ago we made some changes and we haven't had a single case of mastitis since."—Ray Prindle, Interlaken, N. Y.

There you have some of the comments just as they came to us. Of the 37 writers, only 3 expressed serious dissatisfaction with their pen stable. No dairymen, of course, should consider a pen stable until he is sure that the market where he sells his milk will O.K. it.

### Management

"The younger, smaller cows do not get the pick of the roughage. They get enough but not the first choice. The ration cannot be manipulated to force certain individuals as it can when they are in stanchions."—Roland Pierce, Hammondsport, N. Y.

"It is necessary to use adequate bedding. Since we raise quite a lot of wheat and oats, pen stabling makes a good way to utilize it. Since all the liquid manure is retained, the manure

must be better."—John Knight, Interlaken, N. Y.

"It takes two or three years to get cows used to running loose. I have no trouble in keeping cows clean."—Kenneth Wright, Worcester, N. Y.

"I feel that a good dairyman or manager can obtain as good or better results with pen stabling. A poor (or just fair) dairyman can get by with a conventional stable but fail miserably with a pen stable. Pen stabling requires better management, more attention to detail, and closer observation of the herd."—James Gule, Middlesex, N. Y.

"We notice, when our cows are taken off pasture, that there is none of the dropping off in production about which our neighbors complain."—J. E. Sweet, Unadilla, N. Y.

### For Purebreds

Here are a couple of interesting comments on pen stables for purebreds:

"With penstabling, you are not able to control the individual cow as to feed, etc., so if we go into purebreds, we feel we must stanchion our cows."—L. S. Pedersen, Stanley, N. Y.

"Pen stabling does not fit in as well with purebred management as it does with grade cows on a straight milking program. First, with purebred management we have a sales program with breeding livestock and, strange as it may seem, it is almost impossible to demonstrate satisfactorily in a pen stable, the dam of a bull that you are trying to sell to a prospect. He wants her in a stanchion where she stands straight and firm, and where he is able to evaluate her good and poor points with the most ease personally. He gets mixed up when she is rambling around among other cows.

"Then again in a purebred unit we have various ages of young stock, all of which need segregation. They are a nuisance when running with the dairy herd and do not get their fair share of food. It would require 4 or 5 pen stables to meet the peculiar demands of a purebred herd."—Jim Biermeister, Van Hornesville, N. Y.

### Inspectors

The following comments about inspectors may have caused a few burning ears. Perhaps it will be just as well if we keep the names of the writers confidential.

"New York City Inspectors do not like pen stabling, so they always give me a hard time. Although I do have a very good bacteria report, they always find something that requires a re-inspection in 7 days."

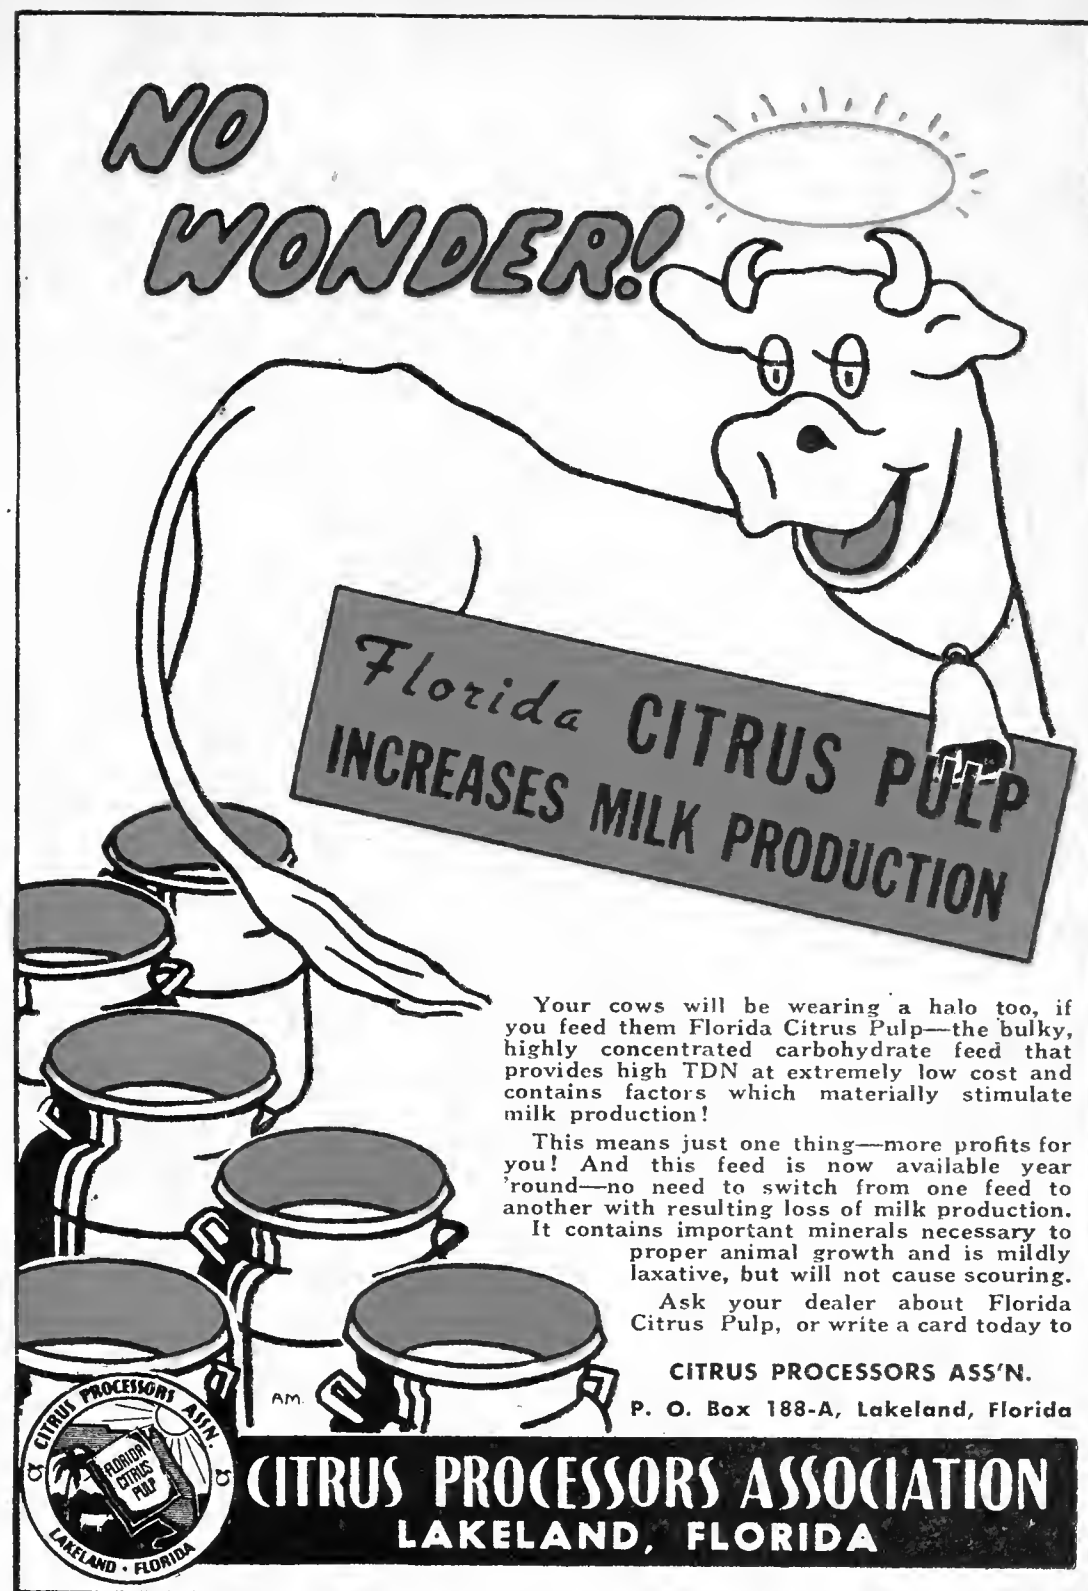

"Perhaps if health inspectors had no extra work on pen stables compared to stanchion types, they would not dislike them so much and make it more difficult for dairymen."

"Health inspectors always find something wrong, so farmers are inclined to keep a little thing or two for them to criticize."

"Why should you have any trouble with health inspectors if you produce clean milk and keep your barn clean? The only trouble with some of them is that they like to show their authority."

"It seems to me there is too much concern about how a man keeps his cows. What difference does it make if he produces milk that passes inspection? Why not put the barn inspector to work in the receiving station doing a better job of testing, and when milk comes in with high bacteria count, get out to the producer and find the trouble? A barn that passes does not mean clean milk. It's the report from the laboratory that tells the story."

**NO WONDER!**

Your cows will be wearing a halo too, if you feed them Florida Citrus Pulp—the bulky, highly concentrated carbohydrate feed that provides high TDN at extremely low cost and contains factors which materially stimulate milk production!

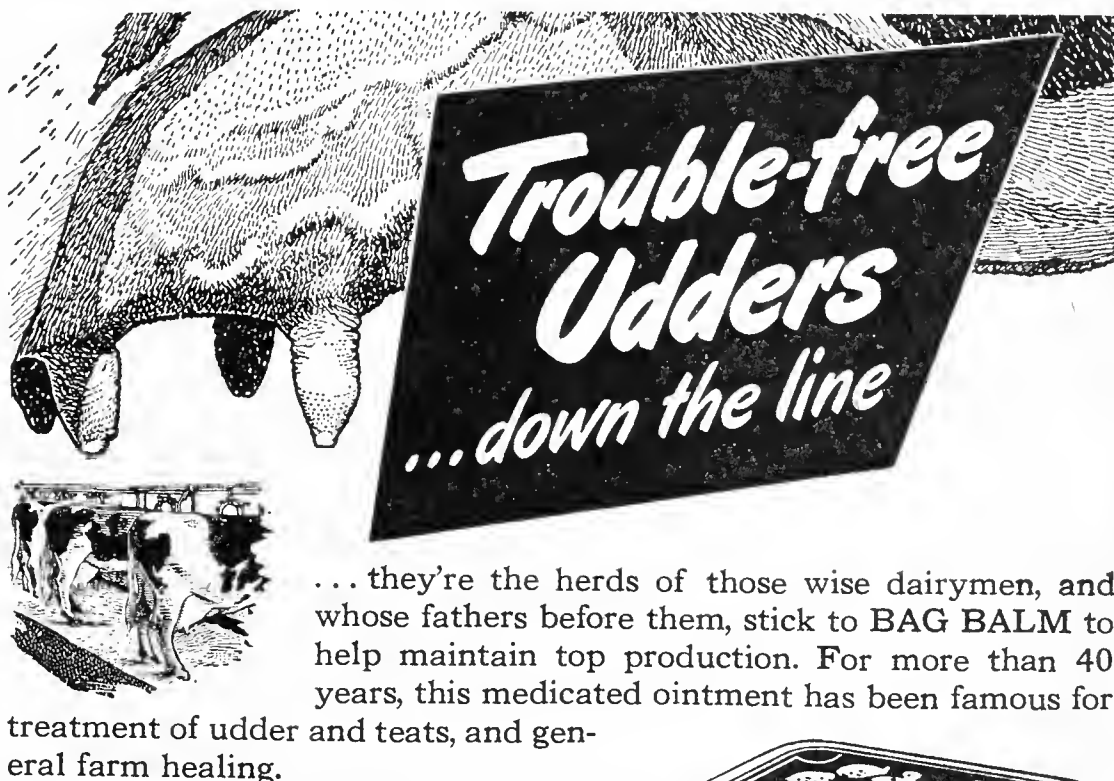

This means just one thing—more profits for you! And this feed is now available year round—no need to switch from one feed to another with resulting loss of milk production. It contains important minerals necessary to proper animal growth and is mildly laxative, but will not cause scouring.

**THE WILSON NURSERIES** THOMAS MARKS & SON  
R. D. 2 WILSON, N. Y.  
The HOME of GOOD DEPENDABLE NURSERY STOCK — Established 1910

Truman Dryer, left, of R. D. 4, Canandaigua, N. Y., and some corn which he picked in January. To his right are his son, Clair, and Edward Shaw, a neighbor who is helping them with the corn.

Mr. Dryer grew 1,900 bushels of ear corn on 16 acres and plans to feed it to 2,500 laying hens, 120 breeding ewes, and 130 feeder lambs. Mr. Dryer and his son operate several farms. They grow about 50 acres of wheat, 40 of beans, and 50 of alfalfa; and in addition to the livestock mentioned, they raise about 10 dairy heifers for sale when they freshen.

The Dryers are very enthusiastic about their latest method of brooding chicks in which the heat is supplied by electric heat lamps.

## Spring Crop Plans

### EARLY PLANTS

There is a considerable amount of satisfaction to be gained in growing your own plants rather than buying them. The best place to do this is in a small greenhouse or hotbed. When it comes to hotbeds the easiest kind to handle is the electric hotbed with a thermostat which keeps the heat even. The electric unit can be bought for a moderate cost.

The last couple of years we have been experimenting with the use of a heat lamp for growing a few plants and it works very satisfactorily. The lamp can be used on plants indoors, although most houses are too dry to be entirely satisfactory. I have even grown them down cellar, the bulb furnishing both light and heat, and later in the spring I have grown them on a bench in the garage.

If you want to raise tomato plants, sow the seeds at least 8 weeks before you want to set them out in the garden, or if you plan to transplant each plant into a container of its own (maybe a tin can) so that you will get early tomatoes, 12 weeks is not too long a time. However, you gain nothing; in fact, you stunt plants if they are allowed to become crowded for several weeks before they are transplanted into the garden.

— A. A. —

### LADINO FERTILIZER OBSERVATIONS

"Management and fertilization affect holding a satisfactory stand of ladino clover in mixtures of clover and grasses," according to J. B. R. Dickey of Pennsylvania State College. "If the clover goes out, the nitrogen supply will be inadequate to keep the grass productive and palatable unless it receives liberal annual applications of manure or nitrogen fertilizer.

"The grass sown with ladino is important. Timothy and brome usually do not make enough vigorous growth in July and August to keep up with the clover and may be completely smothered out. Ladino without grass winterkills badly, is much less productive, is not so palatable to cattle as a

mixture, and may cause bloat and digestive disorders. Orchard grass on well-drained locations is the most vigorous and productive partner of ladino, but if sown too thickly will soon crowd out the ladino. Five pounds per acre is a maximum seeding of orchard grass in such mixtures... The clover should be allowed to make a good top growth before cold weather.

"Grazing after October 1 may result in severe winter losses. Ladino clover needs an ample supply of phosphate and potash. Annual applications of 300 to 400 lbs. per acre of 0-12-12, 0-20-20, 0-14-7, or 0-20-10 seem advisable."

— A. A. —

### BIRDSFOOT TREFOIL IN NEW YORK

There has been a big campaign in upstate New York to increase the acreage of birdsfoot trefoil. For full details for seeding, variety, and fertilizer recommendations, consult Extension Bulletin 561 (Cornell University). Briefly summarized they are:

1. Prepare a good seedbed.
2. Use New York grown broadleaf trefoil.
3. Lime to pH 6.0.
4. Apply 500 lbs. of 5-10-10 fertilizer at planting time.
5. Inoculate with specific trefoil culture.
6. Use 5 lbs. of seed per acre.
7. Seed alone and keep weeds down.
8. If nurse crop is used, remove early.
9. If manure is used, apply after at least two years' growth.

— A. A. —

### CYANAMID FOR WEEDS

At the Geneva Experiment Station some trials on the control of weeds in canning factory peas using calcium cyanamid applied with a grain drill or lime spreader have been very encouraging. The calcium cyanamid used was in the form of dustless pellets, which is an improvement, as the old material could not be used when plants were wet. The chemical was applied six days after planting, at the rate of 250 to 300 pounds per acre. Results were good. On plots where 500 pounds were used some damage resulted.

# Good Care Keeps TRACTORS Working

**N**EXT summer, extremely hot days will bring delays and repair bills unless the tractor's cooling system is working properly.

Overloading is one of the main causes of an overheated tractor engine. Another cause is a badly worn or loose fan belt. Either a new belt or a properly adjusted belt will correct the situation.

A clogged water pump or worn bearing in the pump also can cause trouble, especially if the pump is leaking. Repair it or replace it. Regular servicing of that water pump with the proper grade of grease should prevent more worn bearings.

Faulty timing and improper carburetor adjustments will contribute to overheating and valve trouble. Use your operator's manual when making adjustments to correct these troubles.

Clogged radiator fins will cause overheating too. Trash, dirt, weeds and the like will not permit enough air to pass through the grill and radiator to cool the water in the radiator. Keep grill and radiator fins clear of all obstructions by washing through the fins from the engine side. If you have radiator shutters on your tractor, be sure they are open after the engine reaches normal operating temperature.

All hose connections are another point to check. A hose may look all right on the outside but may be in bad shape inside. This will prevent water from circulating as it should. Where hard water is used in the cooling system, lime deposits often form inside the engine and the radiator. Rain water or water that is free from minerals and trash should be used to prevent further deposits.

It is a good idea to flush the cooling system once a year with a lye flushing compound or with a solution of one pound of common washing soda to a gallon of water. Leave the soda and water solution in the radiator for two or three hours with the engine running. Then drain and flush the radiator with clean water before filling it.

Finally, here is a word of caution that may prevent a cracked cylinder block or head. Hot water should not be poured into a cold engine or cold water into a hot engine. Proper care and maintenance of your farm tractor will enable you to get good service during busy months.—*E. C. Schneider, Agricultural Engineer, Vermont Extension Service.*

— A.A. —

## HIGHER CORN YIELDS

The following six rules are given by Virginia Extension specialists for increasing corn yields:

1. Prepare a good seedbed.
2. Apply 400 to 500 lbs. per acre of 3-12-6 or 2-12-12 fertilizer before

planting. Broadcast and plow or disc it in, or apply with a grain drill. Use an additional 300 to 400 lbs. of the same analysis in the row at planting. Where manure is available, 10 tons of manure per acre supplemented with 500 lbs. of 20% superphosphate may be used in place of the above commercial fertilizer, except that put in the row at planting.

3. Plant Hybrid corn.
4. Plant at least 12,000 to 14,000 stalks per acre.
5. Cultivate shallow to avoid cutting off roots.
6. Apply 50 to 80 lbs. of nitrogen as a sidedressing when corn is about knee-high.

— A.A. —

## CROPS FOR MAINE POTATO GROWERS

**I** WAS interested in reading your editorial "Aroostook Turning to Milk and Beef." In a several days' visit to that county last October I heard on every hand "Potatoes are on the way out. We've got to look to another means of livelihood. People just aren't eating the potatoes they used to and we're raising more of 'em per acre!"

This is undoubtedly true, but bettering themselves by turning to milk and beef is, I believe, open to question. There is no doubt that Aroostook County is a very fine farming land. Its chief drawback, as I see it, is its transportation problem which will continue to exist until it enjoys a freight rate on a par with the rest of the East.

Personally I believe more attention should be paid there to raising hay and oats along with potatoes. These two items could at least be economically trucked to most points in New England and their quality is not to be doubted. In my day I have seen oats from all over the United States and Canada. I have never seen finer oats than those from Aroostook except that lack of machinery (oat cleaners and clippers) have made them appear to be a second quality product.

Hay from Aroostook should attract a good market. It is no better than some I have seen from New York State but it will run much better than that raised in other sections of Maine. Here in Oxford County you will find no good hay for sale. Some is raised, and occasionally a little is surplus and therefore for sale, but for the most part that which is available comes from run-out soil and is, therefore, expensive.

Concentrates could, perhaps, be shipped into Aroostook County and mixed with native oats and barley to make good livestock feed. Time will tell.

— A.A. —

There is no "off season" for farm accidents.

These Cornell students, Raymond Borton, Samuel Mitchell and John Wysong, representing the Department of Vegetable Crops, took top honors as a team in the 2nd Annual National Collegiate Judging-Grading-Identification Contest at New Orleans in December.

**WANT BETTER CROPS?**

**BIGGER PROFITS?**

**FEWER CROP FAILURES?**

There are two things you can do to make the best of your local growing conditions and bring in a good harvest:

One is to start with quality seeds. The other is to take the fullest advantage of every "break" you get in the growing season.

To start you off right toward bigger profits, we have prepared a special booklet that gives vital information along both lines.

This FREE booklet gives all the

latest facts about clover, ladino, oats, alfalfa, corn, etc.—with special attention to such popular varieties as Buffalo and Ranger Alfalfas, Cumberland and Kenland Clovers, Clinton "11" Oats, Birdsfoot Trefoil and others.

It also gives you profitable, practical tips on fertilizing, stock feeding, weeds, grass silage, pasture and hay formulas, etc.

Take the first step for better crops, bigger yields now.

# How to Feed "HEAVIES" for HATCHING EGGS

By L. E. Weaver

ONE breeder of meat-type New Hampshires has prepared a bulletin for the benefit of flock owners who are using his strain for the production of hatching eggs. In the bulletin he says, "Our New Hampshires have been bred to turn feed into meat, and since protein tends to stimulate egg production, high protein (mash) intake is called for. Everything possible should be done to stimulate mash consumption."

At another place he says, "All scratch grain should be fed as late in the afternoon as possible. We believe a good mixture is one consisting of 1/3 whole corn, 1/3 wheat, and 1/3 oats. Feed 50-50 breeder mash and scratch grain for the first two weeks, then 60% breeder mash and 40% scratch for one month. From this time on, feed 70% breeder mash and 30% scratch."

Note the emphasis on heavy mash feeding. He later states that in extremely hot weather good results have been obtained by feeding 80% breeder mash and 20% scratch. The bulletin also stresses the great importance of plenty of watering space, especially in hot weather, and at least 35 feet of mash feeding space for every 100 hens.

## Stimulating Mash Consumption

Some readers will wonder how it can be possible to get laying hens to eat so much mash. Here are some suggestions from the bulletin.

"Stirring the mash with your hands on each trip through the house will help."

"Feed fresh complete breeder mash twice daily (italics are mine), allowing feeders to be empty one hour during the day, at the same time every day."

"Breeder pellets (not complete) should be fed our birds after two weeks of production. We recommend 5 pounds of breeder pellets per 100 birds per day."

"When slumps in mash consumption occur during cold or hot weather, breeder pellets should be increased enough to keep total feed intake up to normal, and cut back to 5 pounds per 100 birds when the emergency is over."

The feeding plan suggested by this New Hampshire breeder is the same in its basic principle as the feeding plan that has been used for years at the Western New York Egg Laying Test, and at the other tests as far as I know.

The main idea in both plans is to get the pullets to eat as much total feed as they can possibly be coaxed to eat. From that point the plans differ in several ways. The aim at the laying test is to encourage a heavy intake of mash, but no attempt is made to reach the ratios recommended above for meat-type hens.

Instead of pellets, a wet mash is fed at the test. It is started as soon as the rate of production gets up around 70%. Dried milk powder mixed with water is poured, rather sparingly, on top of the dry mash once each day. Another difference is that at the laying test a layers' mash is fed, rather than a breeders' mash. Of course that is because we are not producing hatching eggs and can save a little on the cost of the mash. Probably the most striking difference is that at the test no attempt is made to limit the amount of grain, except that it is not fed until late in the afternoon; none in the morning.

Here is the way the New Hampshires at the test have performed under the plan so far this year. In October the average New Hampshire pullet ate 4.7 pounds of mash and 4.5 pounds of grain—pretty close to a 50-50 ratio. They laid at a 72% rate for the month. In November they averaged to eat 5.5 pounds of mash and 4.5 pounds of grain—a 45-55 ratio, and their production jumped up to 78 per cent.

These are egg type New Hampshires, I suspect, but the results produced by using this high-mash plan of feeding, I believe, would similarly improve results with meat-type hens.

## Oats Suggested

Another point emphasized by our New Hampshire friend, but not followed at the laying test, is the feeding of oats at a rate considerably above what is ordinarily used. It is a good suggestion. One man who has been feeding oats liberally told me that his hens laid more eggs and didn't become so fat in the abdomen. It seems to me also that heavy feeding of oats may offset any tendency to feather pulling or cannibalism that pellet feeding might encourage.

In conclusion, I want to make clear that the method of feeding that I have described here, with its emphasis on

**Shrawder's Ancona Farm, Richfield 10, Pa.**

heavy feeding of mash and of oats, is designed for use with flocks of heavy-type breeding hens that are producing hatching eggs for the broiler industry. This method is not recommended for market egg production. It will produce the eggs, but at an increased cost for feed. Breeder mash costs more than layers' mash, and all mashes cost more than scratch grain. For high egg yield combined with economy, use laying mash and approximately a 50-50 ratio of grain and mash.

## WET LITTER IN POULTRY HOUSES

**W**ET litter exists as a winter problem on a great many poultry farms. It is an expensive poultry problem because it adds to the cost of producing poultry products. In order to eliminate the trouble, careful study, coupled with trial and error is necessary.

What may seem to be a condition identical with that on some other farm may really be the result of some different condition, and consequently will require a different treatment.

Poor floor construction needs to be considered as the first possibility in eliminating wet litter. Sometimes poultry house floors have been laid before adequate drainage was provided. In new construction this can be avoided by excavating to a depth of 6 or 8 inches and filling in with stone or coarse gravel. In extremely low areas or on soil that is heavy it may be advisable to seal the top layer of stone before laying the concrete.

In cases where the floor is already laid and litter becomes wet from moisture which comes up through the floor by capillary action, a refinishing job is indicated. This can be done by cleaning the floor and then covering it with a layer of 35 pound, or heavier, felt. The laps should be sealed with tar to prevent water from seeping through. Place a new layer of concrete at least one inch thick on top of the paper. Unless the pressure is very great, water will be sealed out of the floor.

If this suggestion does not seem advisable, an alternate plan is to dig a trench around the foundation and install a tile drainage system. This should prevent water from working under the building and up through the floor.

If the possibility of capillary water can be eliminated as a source of trouble, the next consideration is condensation moisture. This comes from moisture in the droppings and also from the air which the birds breathe out. Insulation and ventilation are the factors concerned in dealing with this trouble. Wet litter from this cause is a problem in the late fall and during the winter.—Harold Hickish

## NEW YORK LAW ON BALED HAY WEIGHTS

**A**CCORDING to Clement Baker, Director of the Bureau of Weights and Measures of the New York State Department of Agriculture and Markets, a considerable amount of baled hay is not tagged in accordance with legal requirements. The requirements for mow-baled and field-baled hay are different. In the case of mow-baled hay, the New York law requires that each bale be tagged with the net weight and name and business address of baler.

In the case of field-baled hay, the only requirement is that bales be tagged with the business address of the presser or the name of the owner. The net weight is not required because there is so much change in weight after baling. However, when field-baled hay is sold other than by the bale, a bill of sale is required stating the number of bales, and their total net weight at the time of the sale. When field-baled hay is sold at retail, the dealer must weigh and mark the net weight on the tag attached to the bale.

## MY EXPERIENCE WITH BIRDSFOOT TREFOIL

(Continued from Page 16)

most successful farmers in this county with the crop was Emil Gutekuntz, who had a farm in the southern part of the county. He consistently obtained good stands any way he seeded the crop. As in other similar instances, though, he had a soil that was quite well supplied with lime, and he followed a good fertilizer program.

### Seeding Lessons

Seeding failures were frequent in the early years, but in my judgment most of these failures were explainable. It is not surprising that we had these failures, since so little was known about the crop. We had to learn the hard way. One of the chief reasons for these failures, I feel, can be attributed to too much talk about its being a poor land crop. Most of the natural stands occurred where there was lime in the subsoil, or at least the subsoil was only mildly acid. The outstanding successes with the crop occurred where some attention was given to a lime and fertilizer program.

Considering the frequent very high hard seed content, our seeding rates were often too low to give quick initial stands. Then there was difficulty with the first inoculating culture. Farmers, as a result of their previous experience with alfalfa and ladino clover, added birdsfoot to their regular seeding mixtures rather than making a simple mixture of it and timothy as was recommended. Red, alsike and ladino clovers smothered it in the seeding year in the great majority of cases when it was handled in this way.

Based on my experience, I would therefore do the following if I were seeding it myself: Apply lime in accordance with a soil test; use a mixed fertilizer containing some nitrogen at seeding time; inoculate the seed carefully and in excess of the directions on the container; seed a simple mixture of birdsfoot and a grass (no alfalfa or clover in the mixture) seed with oats that were not sown in excess of one and one-half bushels to the acre. If the trefoil plants look yellow and sickly after the oats are harvested, apply a very light top-dressing of manure immediately or 200 to 300 pounds per acre of 10-10-10.

## WATCH FOR HIDDEN NAMES

Many of you will remember our "Hidden Names Contest" which we are again starting. Here's how it works: Scattered here and there in the advertising columns and standing alone without any reference to any advertising, you will find several names and addresses of AMERICAN AGRICULTURIST subscribers. Every subscriber whose name and address appears this way (the contest does not apply to names appearing either in advertisements or in editorial columns) will receive \$1.00 if he writes to AMERICAN AGRICULTURIST, Box 367, Ithaca, N. Y., saying he saw his name and address on page — of the — issue of AMERICAN AGRICULTURIST. To receive the \$1.00 this letter must be received within one week of the date of issue in which the name and address appear.

By J. F. (Doc) ROBERTS

**W**HAT a hectic week this has been for livestock men everywhere! Reports of "cut-backs" to last June, controls, freezes, and the realization that every animal they owned, the food they wanted to raise, or the things they had to buy were all in the hands of a few men in Washington.

There may be a necessity for such upheavals, and they may do a great deal of good in spite of what a great many of us think. We do know, though, that it will take a long time for a great many farmers to get back the money they lost on the cows they sold on this week's lower market — lower sales which now prove to have been unnecessary; but who knew what those few men in Washington would do? Every packer was taking a big chance on every head he bought.

### A Few Have Much Power

Just so long as those men have the power to make, cut back, or hold prices, then just so long will uncertainty reign and wild guesses and loose conversation be a real power on all our food markets. The public, the farmer, the business man will accept the decision of the people as a whole to set prices and will produce in such a way as to meet those prices. No group is satisfied when prices are controlled by a few men. No one can produce and function for the good of all when their every effort is circumscribed by guesses as to what a handful of men around a table in Washington may do.

No business can operate under the threat of inventory losses and no farm can grow food to meet a price that may be "cut back" at any time. It would be very helpful to business and production if those few men would come out with a policy of no "cut backs" on anything at any time.

Under this present freeze, livestock men can go ahead with their programs with some assurance that their animals will bring about present prices. The "fear" losses preceding the freeze will be recovered, as will other losses in livestock prices over future short periods. Therefore, do not market on a break and do not anticipate much of a raise in the value of livestock for a while at least.

### Avoiding Black Markets

Black marketing can be avoided if those men in Washington will not cut back the prices of hides, wool, pelts, tallow and other by-products of our animals. At present prices for those by-products, the price of just the meat from any animal "killed under an apple tree" would be prohibitive when those by-products are thrown away. A black marketer, during World War II, could throw those parts away or even sell them at a great reduction and still sell his meat for around 50 cents a pound. Today that same meat under those conditions would cost so much that he could not expect to sell it. That is a tip for Washington—that if black marketing should begin to show its ugly head, then just raise the price of ani-

### NURSERY STOCK

QUICK bearing fruit and nut trees shade trees, grapes, berries, plants, ever-blooming rose bushes and flowering shrubs at money saving prices. State and federal inspected. Satisfaction guaranteed. Write today for free colored catalogue. East's Nursery, Amity, Arkansas.

WIND Break Special—2 yr. 8 to 12" Bank Pine seedlings. Fastest growing pine—Make good Christmas trees if kept sheared, 10 for \$1.00; 25 for \$2.00 post paid. \$4.50 per 100; \$30.00 per 1000. Express collect—cash with order. Strick & Allyn Co., R. 1, Elmira, N. Y.

END winter losses. Plant hardy varieties fruits and flowers. Free catalog. Hillcrest Nursery, Greensboro, Vt.

mal by-products which legitimate packers can save, and out will go black markets. If prices on these animal by-products are cut back, then black marketing is assured.

Cows for meat are giving cows for dairy purposes quite a chase. This is just as true with heifers and bulls. I doubt if I have ever seen meat animals and dairy animals so close together as to price. What a wonderful opportunity for dairy improvement this is! Take advantage of it now by getting rid of your old worn-out stock and replacing it with better young stock.

— A. A. —

### DAIRY COUNCIL PROGRAMS

Dairy farmers in Connecticut have had the advantage of a Dairy Council program for 30 years. This past year, 400,000 Connecticut school children learned about milk through the Dairy Council program. The fact that the Council has been in operation for so

long a period indicates that dairymen believe that it is worth what it costs.

A very interesting booklet has been prepared by the Connecticut Dairy and Food Council, Inc., 120 Gillett Street, Hartford 5, Conn. It is called "Then and Now" and compares the Dairy Council program in 1920 and in 1950.

New York State now has several Dairy Councils. For example, in Elmira, New York, the first annual meeting of the Dairy Council was held on January 9. In spite of unfavorable weather, 50 members were present to hear the report of Director Laura Shaw.

Directors elected were Albert Storch, a farmer, to succeed himself, and Henry Wise, a dealer, to succeed George Wolfe. Other directors whose terms do not expire this year are Henry Wigsten, president, Horseheads, N. Y.; William E. Wells, vice president, Horseheads, N. Y.; William T. Smith, Elmira, N. Y.; Claude Ruger, Elmira, N. Y.; H. G. Gelat, Elmira, and George Antes, Pine City, N. Y.

## A Sure-Fire Rat Catching Machine That Is Easy To Use

During the past 25 years the Surprise Self Setting Trap has been given hundreds of thorough tests and, in competition with other traps, has never failed to prove its superiority. There is nothing to equal it for ridding buildings of rats and it can also be used with great success in fields in trapping ground squirrels. It's a self-setter and a rat getter. If you're wise you'll get a Surprise. \$5.95 Postpaid.

# Chocolate Cake Contest

## FOR NEW YORK GRANGERS

**P**LENTY of prizes, fun and excitement are in store for New York State Grangers from now until next October, annual meeting time. The big GRANGE-AMERICAN AGRICULTURIST baking contest gets under way this month, and for the first time in all the years that this publication and the Grange have been jointly sponsoring these annual baking competitions, chocolate cake is to be IT!

This year's number of contestants is expected to beat last year's record of 4,000—for who doesn't have a favorite chocolate cake that they would enjoy putting into competition with their neighbors' cakes? In fact, there are so many different kinds of chocolate cake that at first we were stumped as to how to prepare a suitable score card for the judges. But with the expert help of Miss Lillian Shaben, Cornell University food and nutrition specialist, and suggestions from the test kitchens of several commercial companies, we devised the excellent score card on this page.

The score card defines chocolate cake, for the purposes of this contest, as "any cake made with shortening and chocolate or cocoa," and it specifies that entries are to consist of a chocolate cake baked in a square tin—no frosting or filling, and no layer cakes.

Mrs. Herbert Thomsen of Poughkeepsie, state chairman of the Grange Service and Hospitality Committee, and Mrs. Mabel Hebel, A.A.'s home editor, will have charge of the contest. Assisting them will be Mrs. Ola Scudder of Fleischmanns and Mrs. Charles Arnold of Bergen, members of the state S. & H. Committee; also, the chairmen of all Pomona and Subordinate S. & H. committees in the state.

Subordinate Granges will hold their contests first, beginning this month. These will be followed by county contests, in which winners of the local contests will compete. In the final match at State Grange next fall, the 53 county winners will vie for the title of State champion chocolate cake maker and valuable cash and merchandise prizes.

Home Editor Mabel Hebel, Co-director of the Grange Chocolate Cake Contest

Now here are the contest rules and prizes:

### CONTEST RULES

1. Each contestant must be a member of a New York State Subordinate Grange. All members (men and women) are eligible, with the exception of those who are professional bakers.
2. Each contestant is to enter a chocolate cake baked in a square pan approximately 9x9x2 or 9x9x3 inches. (See score card and standards for scoring on this page. A copy of this score card will be furnished to every contestant.)
3. Subordinate Grange winners will compete in the county contests, and the county winners will match cakes in the final state contest in October.

### PRIZES

Twenty-seven cash prizes, totaling \$100.00, are again offered this year by

AMERICAN AGRICULTURIST to state contest winners. These will be divided as follows:

First .....	\$25.00
Second .....	20.00
Third .....	15.00
Fourth .....	10.00
Fifth .....	5.00
Sixth .....	3.00
Seventh .....	2.00
Eighth to 27th, \$1.00 each .....	20.00

Also, each county winner taking part in the final State Contest in October will receive from the New York State Grange an entry prize of \$3.00, making a total of \$159.00 in Grange entry prizes.

Besides these cash prizes, many attractive merchandise prizes will be awarded to both State and Pomona winners by AMERICAN AGRICULTURIST advertisers. They will be announced later in these columns and a list of

them will be sent to the chairmen of Pomona Service and Hospitality Committees.

Additional prizes for Pomona Grange Contests and prizes for Subordinate Grange contests will be arranged for by the chairmen in charge of the contests, who have had fine cooperation in the past from local merchants.

### HOW TO CONDUCT LOCAL CONTESTS

The following suggestions are for chairmen who will have charge of the Subordinate Grange contests:

1. Set an early date for your chocolate cake contest and announce it at your next meeting. Give score cards to contestants and put a notice in your local paper about it. (Score cards will be sent to you by Pomona chairman.)
2. Choose judges and arrange with local merchants for prizes, such as cake flour, sugar, etc.
3. Have judges score entries according to standards of the contest score card. If there is a Home Economics expert among the judges, invite her to give a short talk on how to make chocolate cake successfully.
4. Chocolate cake and milk would make wonderful refreshments on chocolate cake contest night! Cakes will not be frosted, but after the judging they could be sprinkled with powdered sugar before serving.

### ATTENTION POMONA CHAIRMEN!

If you are the chairman of your Pomona Service and Hospitality Committee, please write at once to Mrs. Herbert Thomsen, Overocker Road, Poughkeepsie, N. Y., and give her your correct name and address. This is very important, as no prizes for the county contests can be shipped until we have a complete list of names and addresses of all Pomona chairmen.

And now AMERICAN AGRICULTURIST says to all the thousands of Grangers who will take part in this contest: Ready, set—go! We wish each and every contestant the best of luck, and we know from past contests that some of the top winners will be inexperienced cooks who determined to learn to bake a prize-winning entry — and did it!

Mrs. Herbert Thomsen, Poughkeepsie, Chairman of State Grange Service and Hospitality Committee.

### SCORE CARD

		Perfect Score	Judge's Score
General Appearance .....		10

b. tender .....	8		
c. fine, uniform grain .....	8		
Color .....	8		
Flavor (taste and aroma) .....		35	
Total .....		100	

### STANDARDS FOR SCORING

Each contestant will enter a chocolate cake baked in a square pan approximately 9 x 9 x 2 or 9 x 9 x 3 inches. Pan may be a little larger or smaller. For the purposes of this contest, any kind of cake made with shortening and using chocolate or cocoa is eligible. Do not use frosting, icing, or filling. Layer cakes are not eligible.

**SIZE:** Well proportioned; the right size cake for the pan; not too thin or too thick.

**SHAPE:** Square. Flat surface or very slightly rounded.

**CRUST:** COLOR of top, sides, and bottom of cake very nearly uniform. No scorches, no streaks of unabsorbed flour. TEXTURE—crisp (not steamy or soggy, nor too hard and dry); tender; smooth (not bubbly nor lumpy). THICKNESS—as thin as possible.

**CRUMB** (inside of cake): LIGHTNESS—equally light throughout; no heavy spots or streaks; not heavy for size. TEXTURE—moist (not dried out from too much flour or overbaking, but not wet or gummy); tender (not tough; a velvety feel to the tongue; easily broken apart, but not crumbly); grain (fine, round, evenly distributed cells, free from tunnels). COLOR—uniform, characteristic of the kind of cake. Color may vary widely, from a light "milk chocolate" color to a dark brown or reddish brown of devil's food.

**FLAVOR:** Well-blended flavor of ingredients; for example, no pronounced flavor of leavening or shortening. Taste and aroma should be characteristic of the kind of chocolate cake being judged. Note that they count more than any other individual point.

# Woolens Need Good Care

By  
**LOUISE PRICE BELL**

**D**AILY care alone is not sufficient for woolens. They must be washed (if washable), cleaned, pressed or periodically blocked. How often this should be done depends on the fabric and the garment, its color and how often it is worn. Most wool garments should be dry-cleaned, but washable woolens will launder well if you follow a few simple rules:

Examine all garments for stains. Use a good cleaning fluid and follow directions on label.

Rips and torn places should be repaired before washing to prevent enlargement of the holes.

Water for washing and rinsing should be lukewarm, never more than 90 to 100 degrees; the water should feel cool to the hand. Avoid any abrupt changes in water temperatures, such as lukewarm wash water and a cold rinse. This will shrink your woolens.

Make a heavy suds with a neutral soap or one of the good detergents for wool, before the garment is put in. Do not soak wool for any longer than it takes the fabric to become saturated with the suds.

Two or three times the usual amount of soap may be necessary to get wool garments clean. Soap in combination with the alkali in the water forms a curd which remains in the garment unless there are plenty of suds to wash it out. Be sure to use a second heavy suds if necessary to remove all the soil.

When possible, suds should be squeezed through a wool garment by hand, because pounding and rubbing will cause the wool fibres to entangle and mat. When a wringer is necessary for heavier pieces, set it loosely so that the fabric won't mat. Work with the garment under water as much as you can so that the weight of water in it will not distort it. When wool apparel is laundered in your washing machine, make sure that it is not crowded nor agitated violently.

Rinse garments thoroughly in several waters to remove all soap; any soap left in the wool tends to coarsen and discolor it.

After washing knitted wool apparel, blot up excess moisture with a turkish towel rolled completely around the garment. Dry on regular drying frames, or lay flat on a dry turkish towel or paper. For sweaters, socks and knitted blouses, trace the outline of garment on paper before washing. Then place laundered pieces on the outline, and shape with fingertips to original lines.

Never dry wool garments near heated radiators, nor in the hot sun.

## PRESSING WOOLENS

A beautifully washed or cleaned garment deserves a good job of pressing—that last touch that makes or mars the appearance of clothes. A washed wool garment should be pressed while damp. Here are some more pointers on pressing wool:

1. Use a smooth, well-padded board.
2. Press wool fabric on wrong side with a moderately hot iron. A too-hot iron will scorch the fibres.
3. The only way to press wool is to steam-press it. Use a well-dampened cloth—old muslin sheeting for ordinary weights of materials, and lightweight canvas or similar material for heavier fabrics, or a wool press cloth. Keep pressing cloth damp during process.
4. Have a "light touch" with the iron. Do not hold it on one place until the material dries. Never touch the fabric directly with the iron—or press it while dry. Pressing dry makes the

After washing knitted wool apparel, blot up excess moisture with turkish towel rolled completely around the garment. Dry on regular drying frames, or lay flat on dry turkish towel or paper.

Every opening in storage containers should be tightly closed against moths. Use gummed tape to seal packages, boxes, keyholes in trunks, edges of chests and door jamb of storage closet.

fabric shine. Lift cloth while steam still rises.

5. Pin pleats in place and draw buttonholes together before pressing. When pressing pleats, slip a piece of heavy wrapping paper up into each pleat to prevent marks on right side of garment.

6. Seams should be pressed open, without cloth, on wrong side, then steamed with a press cloth. Avoid a mark on right side of material by using a 2-inch strip of wrapping paper under seam edges.

7. Press hems, collar, lapels, and other heavy parts first, starting on wrong side.

8. Stop pressing before material is quite dry, and place the garment on shaped hanger which will let it dry in natural lines.

## STORING WOOLENS

The most important points to consider in storing woolens at home are: first, that they are absolutely clean; second, that each box, bag, or other container is completely sealed so moths cannot enter; third, that they are stored in cool, dry places.

Sprinkle liberal quantities of moth crystals into pockets and box crevices. Always pack wool lightly, and never fill a chest so full that the lid must be forced down. Use gummed tape to seal packages, boxes, keyholes in trunks, edges of chests, and door jamb of storage closet.

Press wool fabric on wrong side with moderately hot iron and well-dampened pressing cloth. Folded strips of heavy paper under hemlines, cuffs, and seam edges will prevent pressing marks.

# WHO NEVER BRAIDS A RUG

By **ELAINE V. EMANS**

Who never takes the time to braid a rug,  
Strand over strand, of colored wool or cotton,  
Or silk material for which she has dug  
Into the rag-bag . . . hose, the long-forgotten  
Blue dress, the scarlet jacket . . . misses knowing  
A lovely bond between her and the others  
Who braid and watch their handwork slowly growing:  
Young girls with playhouses, to great-grandmothers.

Who never braids a rug while hours fly  
Can never feel, in rugs that she has bought,  
The pleasure of her whose own rug comes to lie  
Glowing and firm and perfect, as it ought,  
Nor match her pride when, passing through a door,  
She rediscovers it upon the floor.

# It Calls for Compliments!

It's made with  
**DAVIS**  
"double action"

## 1-EGG CAKE

- STEP I** 1 3/4 cup Cake Flour  
1 cup Sugar  
3/4 tsp. Salt  
1/2 cup Milk  
1 Egg
- STEP II** 2 3/4 tsps. DAVIS BAKING POWDER
- STEP III** 1/2 cup Milk
- Combine and beat smooth (2-3 minutes)
- Stir in quickly  
Blend gradually into batter; then beat for 1 minute at 365°F
- Bake in two 8-inch round pans for about 25 minutes at 365°F  
Frost with Swel — chocolaty, creamy-smooth — another Davis product.

Try this quick-mix 1-egg cake. It's so easy! And Davis Double Acting Baking Powder gives it lightness and texture you'll be proud to sponsor! Double action means: the batter rises twice—first in the mixing bowl and again in the oven. That means super-lightness—even when you're delayed getting it in the oven. Try it! Send for set of "Quick-Mix" Charts: R. B. Davis Co., Dept. AA-5 Hoboken, N. J.

# If Ruptured Try This Out

Modern Protection Provides Great  
Comfort and Holding Security  
Without Torturous Truss Wearing

An "eye-opening" revelation in sensible and comfortable reducible rupture protection may be yours for the asking, without cost or obligation. Simply send name and address to William S. Rice, Inc., Dept. 65-M1, Adams, N. Y., and full details of the new and different Rice Method will be sent you Free. Without hard flesh-gouging pads or tormenting pressure, here's a Support that has brought joy and comfort to thousands—by releasing them from Trusses with springs and straps that bind and cut. Designed to securely hold a rupture up and in where it belongs and yet give freedom of body and genuine comfort. For full information—write today!

# Fresh Spring Styles

**No. 3043.** Your casual favorite, the shirtwaist—nicely detailed with a comfort-buttoned front, soft shirring and cuffs. Sizes 10-20, 36-40. Size 16, 3 3/4 yds. 39-in.

**No. 2333.** Ruffled tiers on a dress for play or parties—depending on the fabric you use. Pantie included. Sizes 1, 2, 3, 4, 6. Size 2 dress, 1 5/8 yds. 35-in.; pantie, 5/8 yd. 35-in.

**No. 2536.** A smartly styled cotton frock always rates a welcome in any busy wardrobe—especially if it is easy to make, like this! Sizes 12-20, 36-46. Size 18, 3 1/4 yds. 35-in.

**No. 2144.** An attractive, cropped sleeve dress with a six-gore skirt shows

up wonderfully in a fresh Spring print. Versatile jacket. Sizes 12-20, 36-46. Size 18, 5 3/8 yds. 39-in.

**No. 2282.** She'll love either version of the front-buttoned dress with bonnet and panties to match! Sizes 2-8. Size 4 dress, 2 1/2 yds. 35-in.; pantie, 5/8 yd. 35-in.; bonnet, 3/8 yd. 35-in.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 20 cents for each pattern wanted. Add 20 cents for our new Spring-Summer Fashion Book which has smart pattern designs for all ages, sizes and occasions. # HERE'S NEWS!

## It's Selling Like Hotcakes

WE'RE talking about our new **AMERICAN AGRICULTURIST** cookbook—**A TREASURY OF COUNTRY COOKERY**. And no wonder it's selling fast! It contains over 600 of our choicest and most popular recipes, selected from the thousands of tested recipes we have published during the past 25 years. No other cookbook on the market has recipes that are so right for farm families, and so easy to use. Among them are:

- Hearty soups and chowders
- Main dishes—meat, poultry, game, eggs and fish
- Wonderful desserts — puddings, ice creams, custards, pies, cakes, cookies, fruit desserts
- Cellar shelf favorites—our best jams, jellies, pickles and relishes
- Delectable maple treats, including treasured maple sponge and angel food cake recipes
- Cheese dishes, and directions for making cheese
- Grange baking contest prize-winners' recipes
- A handy, up-to-date canning guide
- Breads and Rolls

The price of the book is  
just \$1.95

Use the coupon below to order your copy.

American Agriculturist, Box 367-CB  
Ithaca, N. Y.

Enclosed please find \$1.95 for which please send me postpaid a copy of THE AMERICAN AGRICULTURIST TREASURY OF COUNTRY COOKERY.

# Pretty Pillowcases

Rambling Rose is the intriguing name given to design No. P-312, a crocheted applique for pillow cases. Crochet in your favorite colors of mercerized crochet, size 30. It is crocheted in simple crochet stitches and each motif measures 4 1/2 inches in diameter.

Forget-me-not, No. P-310, consists of small simple-to-crochet squares that are sewn in groups of four to make a delightful pillowcase design.

Send three cents for an instruction sheet for each of these designs to Embroidery Department, **AMERICAN AGRICULTURIST**, 10 North Cherry Street, Poughkeepsie, New York.

# Good Meals in Lent

By MABEL HEBEL

**M**OST families have the fish-once-a-week habit, but when Lent comes around, fish and shellfish really come into their own. Fish is so easy to cook, so digestible, so high in food value, and comes in such variety that it deserves to be included in our menus much more frequently the year 'round. It's easy to procure these days, too—fresh, frozen, canned, dried, or salted. Here are some delectable fish dishes that your family will like so well they'll want to see them on the table often!

## BAKED HADDOCK IN CHEESE SAUCE

1½ pounds haddock fillets, fresh or frozen  
2 tablespoons butter  
2 tablespoons flour  
1 teaspoon salt  
Dash of pepper  
1 cup milk  
1 cup grated American cheese

Melt butter in saucepan. Stir in flour, ½ teaspoon salt, and pepper. Add milk gradually, while stirring, and cook over low heat until smooth and thickened. Stir in the grated cheese. Arrange fish fillets in shallow baking dish or pan. Sprinkle with the remaining ½ teaspoon salt, and then pour cheese sauce over all. Bake in moderate oven, 350° F., for 25 minutes, or until golden brown. Serves 4.

## FISH IN CUSTARD

2 pounds fish fillets  
1 pint milk  
2 eggs  
½ teaspoon salt  
½ teaspoon pepper

Cut fish into serving-size pieces and dip in seasoned flour. Place in buttered pie dish. Make the custard by scalding milk; add ½ cup of hot milk to beaten eggs; return this mixture to hot milk and stir constantly until slightly thickened. Season with salt and pepper and strain over fish. Set in pan of hot water and bake in a moderate oven, 350° F., until nicely browned, about an hour. Serves 6.

## SHRIMP AND VEGETABLE DINNER

1 cup biscuit mix  
3 cups medium white sauce  
2 onions, thinly sliced  
3 tablespoons butter  
1 cup cooked carrots, diced  
1 cup canned peas, drained  
2 cups canned shrimp

Prepare biscuit dough according to directions on box (or make your own baking powder biscuit recipe). Cut out biscuits and set aside. Prepare white sauce. Sauté onion in butter until

tender but not browned. Add to white sauce with carrots, peas and shrimp. Pour mixture into casserole and arrange circle of biscuits on top. Bake in hot oven, 450° F., for 15 minutes. Tuna fish may be used instead of shrimp. Serves 4.

## TUNA FISH CASSEROLE

1 7-oz. can tuna  
1 tablespoon lemon juice  
4 sliced hard-cooked eggs  
1 cup cooked peas or beans  
2 tablespoons butter  
2 tablespoons flour  
1 cup milk  
¼ teaspoon salt  
Few grains of pepper  
½ teaspoon Worcestershire sauce  
1 cup buttered bread crumbs

Flake the fish. Add lemon juice. Arrange fish, eggs, and peas in a casserole. Melt the butter in the top of double boiler, add flour and blend. Add milk and seasonings, and cook over boiling water, stirring constantly until thick. Pour this white sauce over the fish, eggs, and peas and top with bread crumbs which have been mixed with a tablespoon of melted butter. Bake in moderate oven, 350° F., 20 to 25 minutes until thoroughly heated and crumbs are brown. The oil from the fish may be mixed in with the fish. Serves 4.

A delicious tuna fish casserole which is a "quickie" is made like this:

1 7-ounce can tuna  
2 cups potato chips (or cooked noodles)  
1 can cream of mushroom soup  
¼ cup milk

Mix tuna fish, potato chips (or noodles), soup and milk together. Put in 2-quart buttered casserole and bake in moderate oven, 375° F., 30 to 40 minutes. Serves 4.

## BAKED SALMON SOUFFLE

3 tablespoons butter  
3 tablespoons flour  
½ teaspoon salt  
¼ cup milk  
1 cup flaked salmon  
1 teaspoon lemon juice  
3 egg yolks, beaten until thick and lemon-colored  
3 egg whites, stiffly beaten

Melt butter, add flour and salt. Stir to a smooth paste. Add milk and cook until thickened, stirring constantly. Cool slightly, add salmon, lemon juice, and egg yolks, mixing well. Fold in egg whites. Pour into buttered casserole and set in pan of hot water. Bake in moderate oven, 350° F., for 40 to 50 minutes, or until firm. Serve at once. Serves 6.

Says New Dry Yeast gives such dependable results

## Baldwinsville Cook Wins Silver Cup at New York State Fair

Young Thelma and David admire the trophy that proves their mother is a champion cook. Mrs. Kathryn Loveless won her silver cup at the 1950 New York State Fair... the first time she ever exhibited there!

And the first time she tried Fleischmann's New Improved Active Dry Yeast, Mrs. Loveless became a Fleischmann's user. "This New Dry Yeast is so fast," she says, "and gives such dependable results."

Do you know—the world's most delicious treats are made with yeast! The delectable flavor and nourishing goodness of yeast-raised goodies make them everybody's favorite!

When you bake at home—do it with yeast... the best yeast. Fleischmann's New Improved Active Dry Yeast is easier, faster, gives better results. Just add to warm water and stir well... it's ready to use! Get several packages today.

## Save \$2.00 On This Home Mixed Cough Syrup

Easily Mixed. Needs No Cooking.

Cough medicines usually contain a large quantity of plain syrup—a good ingredient, but one which you can easily make at home. Mix 2 cups of granulated sugar with 1 cup of water. No cooking! Or you can use corn syrup or liquid honey, instead of sugar syrup.

Then get from your druggist 2½ ounces of Pinex, pour it into a pint bottle, and fill up with your syrup. This gives you a full pint of wonderful medicine for coughs due to colds. It makes a real saving because it gives you about four times as much for your money. Never spoils, and children love it.

This is actually a surprisingly effective, quick-acting cough medicine. Swiftly, you feel it taking hold. It loosens phlegm, soothes irritated membranes, makes breathing easy.

Pinex is a special compound of proven ingredients, in concentrated form, a most reliable, soothing agent for throat and bronchial irritations. Money refunded if it doesn't please you in every way.

**FOR EXTRA CONVENIENCE GET NEW READY-MIXED, READY-TO-USE PINEX!**

### WORK SHIRTS

**10-DAY TRIAL**  
Orders Filled Promptly  
**79¢**  
3 for 225  
**AMAZING VALUES!**

Save money! These are surplus stock from a big supply firm. Sturdy, serviceable work shirts, though used, have been washed, sterilized and reconditioned. Every shirt of long-wearing wash materials. Blue, tan or white. Strongly sewn; reinforced stitching at points of strain. Money-back guarantee.

**WORK PANTS TO MATCH 99¢**  
Blue, tan, white; send waist measure, leg length.

**Shop Coats ..... 1.98**  
Blue, tan, white; send chest measure.

**SEND NO MONEY!** Give name, address, city or town, size and color choice (also 2nd color choice). Pay postman, plus postage. Or send cash and we ship prepaid. Keep 10 days. If not satisfied, return for refund!

Delicious eating at any time is this Shrimp and Vegetable Casserole Dinner with biscuit topping. It's a whole meal in itself!

### WHAT'S GONE BEFORE

Immediately after the marriage of Mark Wilson and his sweetheart, Ann Clinton, Mark leaves to join Abe Lincoln's volunteers. His younger brother, Charlie, runs away to join the army, and later his father, George Wilson, sells off his stock and joins the boys. The day before George leaves, Ann tells him that her father, Fred Clinton, has gone off to enlist, leaving her with the farm work and the knowledge that the mortgage is now owned by Henry Bain, a neighboring farmer who is in love with Ann and hates Mark. In a little respite from the farm work, Ann takes the Clinton girls on a picnic, which turns out to be replete with adventure.

### CHAPTER XII

**T**HE SUN shone, the rain fell and, as always, the crops ripened and had to be harvested. Ann saw apples to be picked, potatoes to be dug, and buckwheat to be cradled, bound, set in the golden shocks, then hauled into the barn and threshed. A couple of acres of corn also waited to be cut, shocked, and finally the grain husked out and the cornstalks stowed away into the barn to feed the cattle.

She knew she could manage to get the corn cut and set up, and the potatoes dug, but as she stood looking at the buckwheat one September day she realized that the cradling job was beyond her. As if in answer to her thought, Enoch Payne just then ambled up the road, a cradle on his arm.

"Had a day on my hands I didn't know what to do with, Ann," he announced, lying like a gentleman, "and thought I'd come over and let down this buckwheat for you."

He stood grinning amid her expostulations.

"I just can't pay you, John. I've nothing to pay you with."

"Shucks!" he said. "There's more'n one way to fight a war. I can't get into the army, but I can help a little bit maybe to save the stuff the soldiers and the home folks need to eat."

A few minutes later he was swinging his cradle up across the buckwheat field, laying the grain in straight even swaths. Ann followed close behind. When she had raked together a bundle of the grain, she picked out a handful of the straw, twisted it deftly together to make a band, passed it around the bundle, gave the ends of her buckwheat rope a tug and a twist, and the bundle was tied. Later the bundles would be stood on their butts in shocks to cure for a few days before putting into the barn.

Day after day the women, children, and old men of the village worked from dawn till dark harvesting the crops and getting them into cellars and barns before winter could close down. Day after day as she worked in the fields, Ann's mind traveled South, trying to picture what Mark was doing. Was he getting enough to eat? Did he have a comfortable place to sleep? And, above all, was he in danger? To a lesser extent she wondered and worried about her father, always ending with the hope that he was where he couldn't get anything to drink, so that he could give the best that he had to soldiering and come back home, perhaps broken of the overpowering habit that had nearly ruined his life and theirs.

As Fall drew to a close, cold and freezing nights were frequent. Ann was finishing the last harvest job of digging the potatoes and putting them in-

to the cellar. The ease with which she could pick up and carry a 60-lb. crate of potatoes brought a feeling of pride in her health and strength. She looked back across the work that she had been able to accomplish almost alone in the fields during the summer and fall, and thought with satisfaction that she was a good farmer, and that when Mark returned she certainly could pull her end of the load.

That night, when the potato digging and storing were finished, and her mother had gone to bed, she set the old washtub in the middle of the floor, heated water on top of the stove, half filled the tub and put in a generous supply of homemade soft soap. As she undressed, she wrinkled her nose in disgust at the thick coating of dust from the potato field that had adhered to her all over and blackened her feet, but a little later, glowing and refreshed from a thorough scrubbing, she caught a glimpse of herself in the big looking glass which had been cracked down through the center ever since she could remember, and her heartbeat accelerated as she thought of Mark. It was a happy thought—happy to know that she had a strong and beautiful body, and that she was married to the man she loved. Then her longing for him changed to sadness and a lump came into her throat as she cried:

"Mark! Mark, dear! When will I ever see you again?"

The days grew shorter, the evenings lengthened, and Ann continued her daily trek to the store. Whenever there was a letter from Mark or from Charles

or George Wilson, she would almost snatch it out of John Crawford's hands and hurry to the Wilson home, where she and Nancy could pour over it together. The Wilsons weren't in the same regiments, but were near enough so they could occasionally get together, and apparently they were all getting along all right except for fatigue and boredom, caused by the constant drilling.

In one of his letters, George wrote Nancy that the last time he had seen his sons they were fed up with the "adventure" of army life, tired and sick of drilling, and either wanted to see some action or get out of it and come home. He added that while he agreed wholeheartedly with the boys, he didn't tell them so, feeling that it would only add fuel to their discontent, and that after the disastrous experience at Bull Run it was evident that the leaders were right that it would take something other than raw recruits to put down the Rebellion.

In his letters, however, George seemed much more interested in learning how things were going at home than in writing about the war, and Nancy was glad to be able to report that with Enoch Payne's and the children's help, they had harvested all the crops, and everything was snug for the winter. There was no use telling him, she thought, that she was stretching the truth considerably. It seemed as if there weren't enough hours in the day nor energy enough to get the work done, and the small amount of cash that they had had from the sale of the cows to Henry Bain was dwindling more rapidly than she cared to think about.

But then, she thought resignedly, she was no different from almost every farm woman she knew. In past years there had always been a little extra cash to buy some of the family's clothes at the store. But now, if the children had any new clothes at all she would have to make them. Fortunately, the spring crop of wool from their little flock of sheep had not been sold. So she got it out, washed and carded it, got out the big spinning wheel and put in every minute she could spare from her other duties working the wool into crude homespun cloth. Later she

died the cloth with various designs. Two fleeces of white wool combined with one of black produced the favorite "sheep's grey." Copperas and alum mixed with a solution made from the bark of the butternut tree gave the yarn a very attractive brown color. Purple dye came from a solution of Nicaragua wood, but most popular of all, especially with the menfolks, was madder red. Nancy worked far into the nights making dresses and coats for herself and the girls and a home-made suit for Tom.

"Not much to look at," she commented, a little ruefully, when she thought of all the labor that had gone into the clothes, "but at least they'll keep us warm."

But with all of her skill Nancy had no way of making boots and shoes, and to buy them ate grievously into her little store of cash.

Nevertheless, Nancy was in a better position than Ann, who had no cash on hand at all and little produce to sell from the farm to pay taxes, interest, and to buy the few clothes and groceries that she and her mother needed. Added to Ann's other troubles was the fact that her mother, always highly nervous, irritable and complaining, now seemed to be much worse. Unlike Nancy Wilson, Mrs. Clinton was more or less helpless when thrown upon her own resources. Realizing the situation, Nancy tried to help, but Ann's pride was an obstacle. Finally, however, a compromise was reached. Ann helped Nancy with the spinning and weaving, and in return Ann got some homespun which, with Nancy's help she made into warm dresses for herself and her mother.

Nearing home one winter evening after a day spent with Nancy, Ann was surprised to see a horse and cutter standing by the horse block in front of the house. The horse was tied to the hitching post and covered with a heavy blanket. From an armchair in the big warm kitchen, Henry Bain rose lazily to greet her, while her mother fluttered around excitedly.

"Henry dropped in to say hello, Ann, and I've invited him to stay for supper."

"That's fine," said Ann, wondering what they would have for a decent meal and worrying for fear Henry had stopped to say something about the interest on the mortgage, which was past due. But Henry was affability itself.

Tired from her long day of spinning, and in no mood for small talk, Ann watched quietly while her mother fussed nervously about in an obvious effort to entertain and please Henry. Listening to her mother boasting about how well they were getting along, Ann feared that Henry would get the impression that they were better off than they actually were and fully able to take care of the payments.

To her relief, her mother finally dropped the subject of the farm and its problems and began to discuss the affairs of the neighborhood. Ann became really annoyed as her mother, anxious to please, agreed with Henry's comment that Mrs. Clinton and the other folks at home were having a difficult time to get along, while the men were having it easy in the army.

"They might a deal better," he said, "be here taking care of you and paying their debts instead of interfering with the rights of the citizens in the South."

Ann managed to hold her temper, feeling that because of the mortgage, she couldn't afford the luxury of quarreling with Henry.

Finally, Henry got around to stating, with some pomposity, that he just didn't know how the folks left at home would get along at all if it weren't for a few citizens, like himself, who stayed home and kept the country running. Then, noticing Ann's flushed face, and

(Continued from Opposite Page)

realizing that he was on dangerous ground, he turned to Mrs. Clinton again and began to praise Ann, how proud she must be to have such a good-looking daughter who was a competent worker and could keep things going while the men were gone.

This too obvious compliment made no impression at all on Ann's anger, but it did please her mother, who looked at Henry almost affectionately. When he rose to go, she told him, much to Ann's disgust, how much they had enjoyed his visit and that she hoped he'd come often.

Ann was further upset when Henry replied that he certainly had enjoyed being with them and, since they wished him to, he would come again soon.

\* \* \*

A few days before Christmas, Nancy said to Ann:

"Of course it isn't going to be like Christmas this year with the men gone and with no money to buy anything. On the other hand, it wouldn't be fair to the children not to do something. Have you any ideas?"

"Maybe we could have quite a little fun," responded Ann, "if you'll let me help."

So for the next few days some of the regular work was neglected. Ann and Tom waded through the snow to the woods, found a tree that just suited them, and dragged it back to the house, setting it up in the corner of the big kitchen, where its piney fragrance mingled with the appetizing cooking odors. They popped corn, and the girls spent hours threading it on strings. Then the long strands of white corn were wound over and around the tree.

Nancy found some maple sirup from the previous spring, boiled it to just the right consistency, and, when it cooled, more of the popcorn was rolled in it to make sticky but delicious popcorn balls, some of which were also hung on the tree. Apples were brought up from the cellar and polished to a high gloss, and then they joined the popcorn balls on the tree, glowing among the green branches.

The various members of the family, including Ann, spent much time in John Crawford's store deciding how to make their few pennies buy little gifts for everyone in the family. These included long gay sticks of candy with giddy stripes running around them. Nancy invested in two big sweet oranges to be carefully divided among them Christmas morning. But most of her little store of money, and Ann's too, went for absolute necessities which would be the more appreciated if blessed with the Christmas spirit.

Although, to the children these last days had seemed endless, Christmas Eve came at length. Mrs. Wilson had invited Mrs. Clinton to come with Ann, and Enoch Payne, too, joined the little group. Nancy had made an extra effort with the supper, but the children, even Tom, who considered himself almost a man now, were too excited to do it justice. The table was soon cleared, the dishes washed, and then Nancy said:

"I have a little surprise for you, but we'll have to wait a little longer."

But the waiting period wasn't too long even for the small fry, for soon there came a jingle of sleigh bells outside and the sound of laughter, followed by the opening of the door and the breezy entrance of John Crawford, with little white-haired Mrs. Crawford by his side; Pastor Belden and Mrs. Belden, and tall, spare, homely, middle-aged Mary Curtis, who had helped nurse them all through sicknesses and worked for them at other times, too. Like Enoch Payne, she always seemed to be more interested in helping those who needed help than in getting pay or helping herself.

Wraps were removed and piled on Nancy's bed. Each of the guests had brought along two or three little packages, except John Crawford, who had his arms full of bundles. These he slid under the tree as soon as he arrived, and then straightened up with a sigh of relief.

At last they were all seated, crowded close in a half circle around the big tree, which glistened in the soft light of the kerosene lamps. Nancy spoke softly:

"Mr. Belden, it would be very fitting if you would consecrate our little Christmas get-together with prayer."

The old pastor stood, bowed his head, and talked to God in exactly the same tone of voice and in the same way that he would talk with any other old friend, saying:

"Father, you know our needs and our troubles. But it helps if we can tell them to you. It may seem strange to some of the unthinking that we should celebrate Christmas Eve and the birth of the Prince of Peace when our land is being torn asunder by civil war, when friends and neighbors, citizens all of the same country, are at each other's throats. But we know, oh, God, that in Thy sight a thousand years are but as a night, and the truth which is beyond the understanding of our finite minds is clear to Thy infinite knowledge. The Christ child came to preach peace on earth and goodwill to men, and we cannot understand why we have to suffer the grievous affliction of this war.

"Help us to put our trust in Thee, knowing that some time, somehow, right and not might will prevail. Give us the wisdom to make right decisions in these momentous times, comfort the widow and the orphan in the stricken homes of both the North and the South. Come into this, our own neighborhood, Lord, help us to lean on Thee when our loneliness and sorrow seem more than we can bear. Bless the absent loved ones and the friends gathered here tonight, increase the joy of these little ones, and give us strength and courage to go on. Amen."

"I had planned to have some music now," said Nancy, when Mr. Belden finished, "but I guess the children can't wait any longer, so we'll have music later. Tom, suppose you pick up the presents one at a time, tell Hattie who is to get which, and she'll pass them around. We'll wait until each present is opened before we go on to the next."

As the simple little gifts were handed out, those for the children were eagerly received and joyfully opened, but the pleasure of the others, especially of Ann and Nancy, was subdued, and when some hand-knitted socks and mittens were laid aside for the absent soldiers, Ann could hardly restrain her tears. Realizing this, Mr. Belden said, as soon as the presents had been distributed: "We can't have a Christmas tree without some Christmas music. I can see Enoch Payne's fiddle in the corner. Let's have some good old Christmas carols."

Watching Enoch's big, awkward-looking fingers, gnarled by hard work, sliding so easily over the strings as he led the group in song after song, Ann thought:

"How little we know of the hearts and souls of even our closest friends! There's Enoch now, who never had a music lesson in his life, never had anything but hard work, and yet he has the soul of an artist. Under different circumstances he might have been a noted violinist."

Then noticing the absorbed look with which Mary Curtis watched the play, Ann thought again:

"There is somebody who does understand the heart and soul of Enoch Payne. I hope he knows it."

With Enoch to play the fine old tunes and Timothy Belden to lead, the big kitchen resounded with music. Then came a pause while the women tucked

the younger children, tired from all the excitement, away in their beds. When the singing began again, each person called for his favorite. The carols exhausted, they began to choose the old ballads, and Timothy Belden asked for a verse from Thomas Moore's "Believe Me, If All Those Endearing Young Charms":

"The heart that has truly loved never forgets

But as truly loves on to the close

As the sunflower turns to her god when he sets

The same look that she gave when he rose."

Mrs. Belden wanted "Darling Nellie Grey," and when that was finished, Ann said:

"Mr. Belden, do you know the words to 'The Girl I Left Behind Me?'"

"A verse or two, I guess," he replied. "Want to sing it?"

"Yes," said Ann. "After I left Mark in Owego, a fife and drum corps came down the street. They were playing that tune, and somehow that was comforting and it has seemed like Mark's and my song ever since. Let's sing it."

As Enoch took up the strain of the old marching song, Timothy Belden held up his hand and quoted a verse from memory. Then they sang it with feeling, and so engrossed were they that no one heard the door open. But the song came to an abrupt end when a laughing voice said:

"Who says I left my girl behind me?"

At the door stood Mark, tall, uniformed, grinning at them from ear to ear. There was a moment of astounded silence, and then Ann flew to his arms, almost yelling:

"Is it you? It can't really be you!"

Mark hugged her hard, and then, somewhat embarrassed, he stepped back a pace and everyone gathered around to shake his hand and pat his back. He kissed his mother, and to cover his self-consciousness, said:

"What's to eat, Mother? I'm starved!"

Nancy hastened to set some bread and milk on the table, and while he ate, everyone plied him with questions. Mark told them that he had been more fortunate than his father or Charles in getting a brief furlough, and that the others sent their love and were well the last time he had seen them. Looking at the shining Christmas tree, Mark said he wished he could have been there for the beginning of the evening's festivities, but he and some of the other fellows had missed the stage in Owego. Anyway, he was home and that was all that mattered.

Knowing that the family wanted to be alone with Mark, the guests soon took their leave. Soon afterwards, Mark and Ann and her mother said goodnight to Nancy, and together went down the road to the Clinton house.

When Mark and Ann were alone in their room, he said, a little awkwardly:

"Ann, I heard what you said about hearing that tune, 'The Girl I Left Behind Me,' that day in Owego. I heard them tooting that piece, too, and I felt it was a sort of a special message. I didn't know then whether I was leaving my girl behind me for good. But here I am, thank God!"

Ann waited for Mark to make the first advance, but suddenly he was overpowered with shyness. Although the hour was late, he asked question after question about the farm and Ann's life since he had been gone. Then as he in turn told her about his army life, their awkwardness wore off. Getting up suddenly from his chair, he pulled her up from the stool where she was sitting, and said, huskily:

"Ann, my darling wife! I've missed you so. How I've missed you!"

As his lips pressed hers, she whispered:

"And I've missed you, darling. How can I ever let you go again?"

(To be continued)

### The Settlers

= By =

E. R. EASTMAN

- "It's a wonderful book, filled with real people."
- "It makes the past come alive—a fascinating story of early pioneer days."
- "It has everything—adventure, excitement, historical accuracy, and an absorbing love story."
- "Our children loved it, too. I read it aloud to the family evenings, and we looked forward to it all day."
- "It's one of the great lasting tales of literature."

Have you ordered your copy of THE SETTLERS yet? Don't put it off, or you may not be able to get one. This is a book you'll enjoy owning or giving to a friend. It's very attractive—handsome green binding, lettered in gold, and contains 280 pages of thrilling reading. To get a copy, fill out the blank below and send it in now.

## SUNNYGABLES NOTES

By John Babcock

### LOAFERS OUT OF LOAFING PEN

**D**AIRY Herd Improvement Association records are no good unless you use them. Jack Conner has a fine herd of purebred Brown Swiss which has never been culled closely. He and his wife Jean kept a sharp eye on the DHIA records and found that a few individuals were no more than paying their way. These individuals were thriving under the pen stable system, but were putting on weight where they should have put out milk. With beef prices running good, Jack consigned them as beef rather than risk his reputation by putting mediocre dairy replacements on the market under his name.

### Pay Off

I have a lot of fun needling first Jack and then Boots Poelvoorde as to which is the best dairy breed—Brown Swiss or Holstein. You might just as well argue with two new mothers as to which has the smartest or best looking baby. Jack had a good comeback in favor of his herd when he showed me the receipts from his cull cows.

Of the 4 animals sold, one in particular stood out for the price she brought. I doubt that she would have approached as much money as a dairy replacement.

Weighing out at 1,390 pounds, this four-year-old cow graded choice and sold for a total of \$361.40. That's not bad for a culled dairy cow. I recently saw another Brown Swiss cow slaughtered in Ohio which would have graded good to choice, and which weighed out alive at 1,750 pounds. This weight betrayed her dairy characteristics and milk producing potential, but proved that where they don't pay as milkers, the recovery value on a Brown Swiss is good at current beef prices.

### GRASS SILAGE AGAIN

**I**REALIZE that talking grass silage may be uninteresting to a lot of people and that a fellow can easily become a "bug" over a favorite subject to the point where he is a bore. Grass silage, though, so occupies our thoughts here at Sunnygables that we just have to talk about it some. I think that in our animal agriculture scheme it is important to a lot of other people, too.

### New Discovery

With any subject that you are well acquainted with, it is easy to assume there isn't much you don't

know. With grass silage, time merely proves how little we actually do know.

For instance, I always visualized a tower or trench silo, full of tightly packed green grass, as almost impregnable to water or air from the outside. I was first set straight on this when I learned from a Cornell scientist that the entire mass in a silo breathes all the time, like a living thing.

Just lately I found out another important activity in a silo. It seems that, packed as the silage is, water runs through it as through gravelly soil. In the case of our long grass silo, the water follows the marks that separated the loads dumped in, and courses its way through the silo right to the very bottom. This accounts for a good amount of the spoilage where the silage is wet, soggy, and more like green manure than good feed. Since the grass went in well wilted, we can only assume that the water came down through the silage from the surface.

### Another Slant

In January, I passed on my observation to Dr. Charles Rogers at the Wooster Experiment Station of Ohio State University. Since Dr. Rogers is, in my mind, one of the best informed scientists we have on the practical aspects of making grass silage, I was interested in his reactions.

By the time we had finished talking, I found that farmers had reported surface water discoloration clear to the bottom of uncovered tower silos. Also, Doctor Rogers had completed an experiment in which he was sure that water entering from the top of a silo goes right on through the whole mass.

He pointed out that water carries air. If it didn't, fish wouldn't be able to survive. Also, this large amount of water makes a good solution in which the chemistry of spoilage can take place more rapidly.

Now we have recorded another of the many mistakes we made in putting up our first long grass silage. Instead of covering the silo with porous limestone, we are going to take pains next year to protect the surface from rain falling on it, surface water draining into it, and ground water that might enter. In addition, as we finish off the trench we will take pains to "thatch" the top, much as a hay stack is finished.

Perhaps we have learned by these experiences and observations that in every case, in tower or trench, sil-

—Photo: C. Hadley Smith

Here is Jack's answer to a mild case of pneumonia suffered by two of his Brown Swiss calves. He cleaned out a well sealed grain room and set up an incubator. With help from the veterinarian, fresh whole milk, and a lot of mothering from Jack, they recovered nicely. Infrared heat lamps and blankets kept the little fellows warm and snug, but Jack is wondering whether raising his calves on nurse cows might have helped him avoid sickness in the first place.

age should be protected from the entrance of excessive surface water. With the large initial cost of a tower silo today, it makes sense to go the rest of the way and put a roof on top of it.

### SHEEP?

**I**N PAST years we have had a lot of experience with sheep at Sunnygables. Our most profitable sheep operation was marketing hot-house lambs to the select New York City buyers. Sheep, like any farm animal, do well only when the person keeping them likes what he is doing. Both Jack and I like sheep and talked a lot about running them on the ground-level poultry floors. With the nation's sheep population at an all-time low, and high prices for both lamb and wool apparently in the cards for years to come, the idea merited some thought.

Ewes are expensive right now, but those who encouraged us to buy sheep pointed out that ten or a dozen ewes could be bought for the price a good cow would bring. And in Ohio, where we ran sheep on the farm I worked with, the operation never lost us money. We roughly figured that the ewes' wool paid their supplementary feed costs and that the lamb crop was largely profit. Other farmers pointed out that money can be made with sheep on good grazing lands and high quality feed rather than on the marginal natural grass hill pastures that are often reserved for them.

### No For Now

At this point we have decided to stay out of the sheep business. Among the many considerations that needed balancing, one or two

in particular made us balk. The first was our rather limited grazing acreage, which we had best reserve for a growing dairy herd. The second was fencing.

From the dog loss figures I see in the papers from various counties, it is not only necessary to fence the sheep in, but as nearly as possible to fence the dogs out. Also, one feels more comfortable in having sheep close enough to keep track of them all the time. Putting them out in a back pasture can lead to disasters that would not occur were they nearer the barn.

Most of the fencing at Sunnygables is neither hog tight nor horse high, as the old expression goes. Our cows are well fence broken and give very little trouble where we use three strand barb wire fences. The posts are home cut. This makes inexpensive and effective fencing. Moreover, a barb wire fence can be made up into five or six strands at important places, or reduced to as little as two strands along creek banks or next to fields that offer little temptation to cows hunting greener pastures or the neighbor's bull. Such fences are easy to keep up, last a good while, and can be moved without much trouble. Where needed, they can easily be changed into electric fences.

Since such fences are not adequate for sheep, we think the cost involved to fence and maintain sheep pastures enough of a consideration to make us at least put off raising sheep at Sunnygables for a while longer.

# SERVICE BUREAU

By H. L. Cosline

## BEFORE YOU SIGN!

NOW that the nation is preparing to defend itself, there is the prospect (unfortunate though it may be) that new jobs may open up in Washington. There is a fairly general belief on the part of citizens that any new agencies which are essential should be staffed by those already working in Washington—possibly by government workers who would become available through discontinuance of non-essential activities.

Anyway, the point of this item is to warn readers that already some correspondence schools are using the possibility of new government positions as bait. If you read such an ad, or if you are approached by an agent from such a school, remember these facts:

1. Correspondence schools cannot guarantee a government position.

2. Even though you pass a Civil Service examination you might not be appointed.

3. When you sign a correspondence school contract, you usually agree to pay the full cost whether you complete the full course or not. Before you sign any such contract, be sure that you have the money to pay for it; that you want to take it, and that you have the ability and perseverance to complete the course.

## POOR OLD "SPANISH PRISONER"

The "Spanish Prisoner Swindle" is the oldest known. So much publicity has been given to it that everyone should know about it, although it appears anew at least once in each generation. Right now Post Office inspector Edward J. O'Neill of Syracuse reports that central New York residents have received letters telling the same old story.

The appeal which comes in a letter from Mexico or maybe from Cuba tells that the writer is in prison; that he has a quarter of a million dollars or so hidden away in a trunk or a safe deposit box which he will be glad to divide with anyone who will help him recover it.

The catch comes when the "prisoner's friends" require that the gullible victim put up a considerable sum of

cash to show his good faith, or to advance money for necessary expenses. In the past, anyone who has been so foolish as to fall for this scheme has found that both his cash and the "prisoner's friends" have promptly disappeared. Of course there never was a "prisoner" or a quarter of a million hid away in cash!

— A. A. —

## COW DOGS

I recently purchased a cow dog, but was not satisfied with him. After trying him out for a while, I shipped him back C.O.D. The fellow from whom I bought him refused to accept the shipment, which cost me over \$10 more. Can you help me to get this, plus what I paid for the dog?

There are several things to consider when buying a dog from a distance. First, there is usually a trial period during which time the dog can be returned for a refund. A guarantee does not apply after this trial period is up, and the subscriber who wrote the above letter waited too long before returning the animal.

When a dog is purchased, there should be an understanding as to who will pay the transportation charges in case he is returned. An animal should never be returned C.O.D. (unless the seller has authorized it) because it is quite probable that shipment will be refused, piling up still more expense for the buyer.

It should be remembered that dogs aren't standard merchandise like machines. A dog that has shown up well in training and promises to be a valuable animal may act differently in new surroundings and prove unsatisfactory to the purchaser. When a dog doesn't work out well, it doesn't necessarily mean that he has been misrepresented. However, the buyer should be able to return such an animal within the specified trial period and get a refund.

— A. A. —

If any reader knows the present address of Miles Johnson, formerly of Johnson and Wurtsboro, N. Y., we would very much like to have it. It is believed that he moved to the vicinity of Binghamton about six or seven months ago. Address the Service Bureau, Box 367, Ithaca, N. Y.

Milo Hancock  
Irasburg, Vermont

AMERICAN AGRICULTURIST Inc.  
*L. A. Weatherly*  
TREASURER

## Reward Check Goes to Vermont

BECAUSE Milo Hancock of Irasburg, Vermont, promptly reported the theft of two heifers to the State Police and cooperated with them in tracking down the culprits, he has been sent the \$25 cattle theft reward check shown here.

Hormidas Bolduc and his son, Girard, were taken to court and admitted to this theft as well as several others. The father was sentenced to not less than two and a half years nor more than four years in Windsor State Prison. Girard was given not less than nine months nor more than twelve months in the House of Correction in Windsor.

The AMERICAN AGRICULTURIST poultry

try theft reward offer and the cattle theft reward offer are made with the idea that they will encourage farmers to search for evidence, lose no time in reporting cattle or poultry losses, and to follow through to see that the criminals are prosecuted to the fullest extent of the law. The thief or thieves must be caught, brought to trial and sentenced to spend at least thirty days behind bars before a person can become eligible for the reward. It DOES NOT APPLY to the theft of anything except cattle or poultry. Recently, we have had a number of reward claims in connection with stolen gasoline, farm machinery, etc., which are not covered by our reward offer.

# PLEASURE RIDE BECOMES DEATH RIDE

## TWO DEAD, THREE INJURED, ALL RELATIVES

It was a bright October afternoon near Twelve Corners, Maine, the Bamford brothers John and George were riding with their sons in a 1941 sedan. Without warning there was a terrible crash, the sedan collided with the rear end of a big dump truck loaded with pulp wood. The tremendous impact sent a stick of pulp wood back through the window into the back seat and squarely into the forehead of John Bamford. The smashing force of the wood hurling through the car killed John instantly. His brother riding in the front seat was crushed to death by the collision and all three sons received minor injuries.

Two killed, three injured yet only one, John, was protected with the North American. His wife received \$1000.00 from his North American Travel Accident policy. Everyone in the accident could have received benefits yet only one did. This terrible accident proves that all members of the family should be protected.

THE FARM PAPER OF THE NORTHEAST

The Baker family—Mary and Jim, Dad, Mother and Grandmother—enjoy the evening meal, with home-grown products including beef, milk, potatoes, and snap beans. For dessert there will be pumpkin pie from home-frozen pumpkin.

—A.A. Staff Photo

## A Garden for GOOD FARM LIVING

**W**HEN DAN BAKER of Ithaca, N. Y., and his family sit down at the table, much of the food they eat has been raised right on the farm. The happy combination that brings this desirable result includes a keen realization of the possibilities of a garden, the know-how to grow a good one, and two youngsters who are enthusiastic 4-H Club members and gardeners.

The Bakers' 30-cubic-foot freezer was packed last fall with 164 packages of fruits and vegetables, plus liberal amounts of pork and beef. In the cellar were 200 quarts of home-canned products, a full crock of sauerkraut, and some stored potatoes and carrots. Mrs. Baker's motto is, "Preserve enough of the farm products so that something can be used from the garden — fresh, frozen or canned—every day in the year." Liberal quantities of milk and eggs are also supplied by the farm.

Jim, who is 17 and who has been a 4-H Club member for 7 years, takes the major responsibility for the family garden. His garden project takes in 12,500 square feet, while Mary, who is 13 and also a 4-year Club member, takes care of 2,500 square feet. The young folks like to show their products at fairs, and this past fall Jim won \$30 in prizes and Mary, \$19.

In addition to 19 varieties of annual vegetables, including potatoes, the garden supplies asparagus, rhubarb, strawberries and raspberries. In fact, Jim had  $\frac{1}{8}$  of an acre of

strawberries as a 4-H project, and after freezing 30 quarts he sold enough berries to net him \$50.

The most impressive feature of the Bakers' garden is the attention to detail which brings results. They don't plant seed and then depend entirely on nature for results. The garden is plowed early in the spring. Both manure and 5-10-5 fertilizer are used for additional plant food, and a garden tractor helps keep weeds under control, especially in the early stages. Bugs and diseases are handled by a general purpose dust containing rotenone for insects and a fixed copper compound for fungus diseases.

Jim says it takes about an hour a day to do the work. That hour is doubtless one of the most profitable of all hours worked, because a rough estimate of the retail value of fruits and vegetables grown and eaten on the farm is about \$400. Assuming that an hour a day is spent on the garden for 5 months, or roughly 150 hours, the return per hour of work is about \$2.50. Not bad for a couple of youngsters with a moderate amount of help from the rest of the family. When a pig, half a beef, milk and eggs are added to the total, the retail value of food produced and used on the farm approximates \$1,000.

All farm families—yes, you too—can eat at the first table, especially if you grow a good proportion of your own fruits and vegetables. First you must have the desire, then the knowledge, and finally the perseverance to bring it to pass.

As spring approaches, 4-H Club members Mary and Jim—the gardeners of the family—check over a seed catalog.

The aim on the Baker farm is to use something from the freezer or cellar every day during the winter.

*Year After Year of Trouble-Free, Economical Cooling  
Because G.L.F. Milk Coolers are . . .*

# Built To Last

**M**ANY of the first milk coolers put out by G.L.F. are still in use on dairy farms in the Northeast. They have been providing year-in and year-out efficient and economical service. They are just the kind of coolers farmers asked G.L.F. for back in 1935—coolers that will cool two milkings a day at a low cost per year of use. Over the years, improvements have been made but G.L.F. continues to keep in mind the primary requirements of dairymen for low cost milk cooling.

This is the time to get a milk cooler that is ruggedly built and will give trouble-free service for years ahead—the kind of a cooler that will last and last.

## *Features of G.L.F. Milk Coolers*

- Large Capacity Condensing Units to provide satisfactory cooling during the peak loads of flush periods.
- Bigger Motors are used for reserve power at peak periods and insure longer service.
- Heavy Construction throughout to assure years of use with the banging and wear of loading and unloading heavy milk cans.
- Zerocel Insulation 3" thick on sides and bottom to provide ample protection in warm weather.

## *"Jet-Aire" Side Opening Coolers*

"Less than a foot from the milk house floor to the cooler door." This feature of the new "Jet-Aire" milk cooler saves the tugging and lifting of heavy milk cans.

The "Jet-Aire" system of water distribution keeps lower temperature water circulating over the milk cans and can cool a full load from 90 to 50 degrees within one hour.

Available in 4, 6 and 8 can sizes.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

# G.L.F. Milk Coolers

Cutting and bunching dill on the McKasty vegetable farm.

## QUALITY *Rings the Cash Register*

**I**T'S a wonderful market, if you give it what it wants!" That's the appraisal of the New York produce market voiced by Mrs. Margaret McKasty. She ought to know, for she's been working with her husband, Martin McKasty, and the rest of the family for the past 21 years on their farm near Huntington, Long Island, to suit the whims of the big city trade.

"Every once in a while," she explains, "I spend most of a day just standing around one of the big markets in the city, watching the sort of vegetables the shoppers put in their bags. You'll see a shipment of broccoli come in, all cleaned and graded and pretty as a picture — and two-thirds of the baskets that go through the check stand will have a bunch of that broccoli in them. Then you'll see some carrots, poorly bunched and not sorted for size, sometimes not even well washed, and the shoppers will pick through them trying to find a nice bunch and usually giving up and going on to look for something else."

### Pleasing Mrs. Consumer

These little "research tours" have pretty well established the practice in growing, grading, and selling the crop for the McKasty family.

As an example, in 1949, when the potato surplus was a national problem, the spud crop from 50 acres of the 86-acre McKasty farm was snapped up by New York produce buyers. And again this year, with Long Island potatoes flooding the market, the same buyers sought the McKasty crop and paid a premium price for it.

### A Market for Each Grade

"We graded them 'fancy' — I'll tell you that," says Mrs. McKasty. And every grade found its particular market. The No. 1 sizes went to the exclusive hotel and steak-house trade. The No. 2 grade sold to a potato salad maker, who would have taken 5,000 sacks of this quality if the McKastys had been able to deliver. The No. 3 grade went to markets in the New York foreign quarter. The "Jumbos" all sold to restaurants and lunch wagons for French fry purposes. The culls, referred to as "pig potatoes," were traded with a hog raiser for manure.

### "Picture Book" Acres

Before "quality" crops can be marketed, however, a "quality" job of growing has to be turned in. This means a lot of work for the family crew, which includes three daughters, a son, and a cousin. But that work shows up in "picture-book" acres of onions, cabbage, lettuce, kale and other green vegetables, all hand-set, to say nothing of the cleanest, prettiest potato fields you're likely to see anywhere.

Naturally, protecting these crops against insect pests and plant diseases is one of the major activities through

the growing season. Harold Neder, the cousin, who operates the McKasty spray rig, estimates that where three vegetable crops a year are taken off the same fields, he applies from 2,000 to 2,400 gallons of spray per acre to the produce.

It hasn't always been easy to keep the bugs and diseases in check. The McKastys recall a spring several years ago when a "blight" they weren't prepared for hit their valuable cold frames of lettuce plants. They quickly got in

Martin McKasty, Jr. washing parsnips to provide a clean and attractive product, the way all McKasty vegetables go to market. The insert is Martin (Pop) McKasty.

touch with the Du Pont Company's agricultural specialist in New York. The "blight" was analyzed and one of the new carbamate fungicides — the zinc-base material known as "Parzate" — was prescribed to halt the spread of the fungous infection.

### Plant Protection

Since that time, "Parzate" fungicide has been a regular part of the program for protecting plants against disease. It is mixed with DDT for application to potatoes, to combine insect protection with insurance against late blight and other spud maladies. It is combined with other insecticides for the other truck crops, where edible portions are above ground and materials less toxic than DDT are required.

The proof of the program is certainly to be found in the appearance of McKasty crops on their way to market. And when they admire the top layer of a crate, buyers know they can depend on finding the same quality all the way to the bottom of the box, for that's another principle on the McKasty farm.

"No 'sample crates' are packed by us," boasts Mrs. McKasty!

## WHO IS YOUR TOWN SUPERVISOR?

FOR YEARS I have written, talked and worked to keep control of our public affairs in the localities. At times I become discouraged because so many of the people in the localities take so little interest in their public affairs. There is no use talking about grass roots government unless the people themselves are willing to take part in it. They are not doing that now.

Recently an AMERICAN AGRICULTURIST staff member asked a group of young people the names of their public officials. They did very well in naming the President and several other national office holders, and they could name a lesser number of State officials. But very few of them could name their own town supervisor or any other county or town officials! I doubt if any large proportion of older people could do much better.

The town meeting and the school meeting are two of the most democratic institutions we have left. But so far as the general public is concerned, these important meetings are little used. About the only time they are well attended is when there is a row on.

One reason for the poor attendance both at school meetings and town meetings is that they are poorly advertised, poorly planned, and the programs are uninteresting. As a definite suggestion to boards of education, town supervisors and town boards, why not start now to build interest in your coming school and town meetings?

Farm organizations have done a good job in this respect. Their meetings are well attended. On the program there is usually a good dinner; there is some community singing, the business of the meeting is presented in well-thought-out charts; there is opportunity for questions and discussions; there is frequently one good speaker and sometimes an entertainer. Those who attend go home having spent a pleasant afternoon or evening, with a good idea of the business of their organization, and resolved to come again next year.

I urge supervisors, other town and county officials, and members of school boards to give attention to this important business of getting a larger number of the local people interested in running their own business.

*By E. R. Eastman*

## WOULD YOU PLANT AN APPLE ORCHARD NOW?

A YOUNG MAN WRITES:

"I am in partnership with my father in the apple business. Our trees are mostly getting old. If I am to stay in the business we must have young orchards coming along. What is the outlook?"

THERE are several sections of our Northeast that are naturally adapted to apples, and where the quality is unexcelled. If a young man lives in an apple-producing section, if he has soil naturally adapted, if he is willing to keep up with the latest practices and, above all, if he likes the business, I think most of those who have studied the problem would encourage him to go ahead. He naturally will not proceed without getting what help he can from authorities on the soil and other conditions on his own farm; on the outlook for different varieties, and on the future market situation, such as competition from other apple-growing sections and from other fruits.

What do some of you apple growers think? There are a lot of young fellows who would like your opinion. Let's have some letters.

## UNREASONABLE MILK SANITATION RULES

NOT IN years have I seen a man so angry as a dairyman was the other day at a milk health inspector. For two years, this farmer and his sons have used every minute of their time, outside of their farm operations, in building a modern barn and stable. The inspector visited the barn the other day and told the farmer of several costly changes that he would have to make in his new barn, stable and milking parlor before his milk could be accepted.

The farmer "blew up" and told the inspector what he thought of many of the impractical sanitary rules and the lack of common sense in their enforcement.

Anyone who has produced milk knows that this

farmer is right. Every good farmer wants to produce high quality, clean milk, and progress has been made in doing so. But the problem has been approached wrong end to. I don't want to buy or drink unclean milk, but I'll take milk any time that meets the following qualifications:

1. Low sediment test.
2. Low bacteria test.
3. Freedom from offensive odors.

These tests could be applied at the milk plant, and it would seldom be necessary even to visit the stable, for if the barns were dirty or the milk improperly handled it would not meet the tests.

Fortunately, the milk industry, the scientists, and the authorities are studying the problem of simplifying milk sanitation. Let's hope that they will come up with some simple and more practical rules.

## OUR ALASKA TOUR STARTS AUG. 1

JUST 93 lucky persons are going to be able to take the wonderful Alaska Tour which AMERICAN AGRICULTURIST is sponsoring this summer! We are sorry to have to limit the party to 93, but we could not secure more boat space. Tour dates are August 1 to August 26, and it will be an "all-expense" trip conducted by our popular tour conductor, Mr. Verne BeDell.

In addition to Alaska, the places to be visited will include Yellowstone National Park, beautiful Mt. Rainier, the Canadian Rockies, Lake Louise, Banff, and a fascinating boat trip amidst matchless scenery on the Inland Passage to Alaska, the Land of the Midnight Sun. Full details of the trip will be in our next issue. If you want to go, don't delay in getting a copy of the itinerary and in making a reservation. Remember, we will take the first 93 persons who make their reservations. For tour itinerary, write to AMERICAN AGRICULTURIST, Box 367-T, Ithaca, N. Y.

\* \* \*

If you can't tell which came first the hen or the egg, can you tell which end of the egg the hen lays first? More important to know is that in order to preserve quality, eggs always should be packed with the small end down.

## EASTMAN'S CHESTNUT

IN THESE days of fast-moving trains and automobiles, even some of the oldsters have forgotten how irritatingly slow some of the "accommodation trains" and other locals used to be on the old branch line railroads. Many old chestnuts resulted from experiences with slow trains. Mr. Frank M. Bailey of Auburn, Maine, tells one about the man who went into the station agent's office and asked when the train from a certain town would get in. The agent replied:

"Pretty soon now. The engineer's dog has been here quite a few minutes."

There were a number of slow train chestnuts, too, about cows on the track, and here's one of these, also furnished by Mr. Bailey:

A train was rolling along at a slow speed and all at once stopped. The conductor went through to find out what the trouble was. When he came back a man on the front seat asked what the trouble was, and the conductor said, "Cow on the track."

They rolled along again for a while and stopped again. When the conductor came through the second time, the same man asked what the trouble was and he replied, "We caught up with that darn cow again!"

Along this same line, my brother used to claim that some trains needed a cow catcher on both ends, the one in front to push the cows gently off the track and one at the rear to keep the cow from running over the train!

Know any more good railroad stories? Send them in.

NO MATTER how interested a man may be in his job or in his public work, his chief interest in life is or should be his family, for the family and the home are, of course, the chief sources of our happiness and the most important units in our society.

As an illustration of one ideal American family and what its members have been able to achieve under our American way of life, I call your attention to the picture above of my friends, Mr. and Mrs. Martin F. Hilfinger, of Syracuse, and their family of four sons with their wives. In the group are represented twelve college degrees; the five men were awarded a total of 26 varsity block letters covering six different sports at Hamilton College and Syracuse University; three of them were captains of varsity teams; all of them are members of Psi Upsilon fraternity. The three oldest have splendid war records. All are doing well; all are good citizens. In addition to the group shown there are four grandchildren.

Among our readers are many thousands whose families have made outstanding achievement in one way or another. Let's hear about them in a short letter, and we'll publish as many of these letters as we can find space for.

# AA's Farmers' Dollar Guide

**FARMING UNDER PRICE CONTROLS:** It looks as though the general price level would continue upward. However, a full-scale war is not certain and improvement in world relations could conceivably (though not probably) bring price recessions. If that happens, businessmen, including farmers, would take lower prices; but wages, and therefore production costs, would continue high. Good course for farmers is to aim for reasonably high, but not "all out," production.

**PRODUCTION:** Under a price control economy, put more emphasis on quantity and less on quality. As controls become effective, price premiums for quality vanish. **Top farm production is important, but so is top industrial production.** Strikes which farmers think unjustified do not inspire them to increase hours or risks from patriotic motives alone.

**FARM LABOR:** Hired men are leaving farms for 2 reasons—high pay in industry, and to don uniforms. Here are some ideas about farm labor that you may want to consider:

1. If you have a good hired man, a few improvements in the tenant house may keep him satisfied.
2. Consider more privileges, such as bigger garden, firewood, a few hens, a veal calf or an occasional day off.
3. If you plan to hire help from a labor camp, make arrangements early.
4. Keep equipment repaired and ready to go.
5. Plan only work that you can handle with your prospective labor force. You can reduce labor by doing work on time, controlling weeds with chemicals instead of cultivation, rearranging buildings to save steps, putting nitrogen on a meadow or two instead of plowing them.
6. If you have a hired man of draft age, keep the draft board informed.

**SUPPLIES:** No man is hoarding who gets needed supplies early. Buy and take early delivery on spray materials, seeds, fertilizer, lime, baling wire and twine, baskets and crates. Maintain a good inventory of feed. It does pullets no good to change their ration quickly. Plan ahead what you will do if you can't get exact supplies you want.

**INSURANCE:** Why not look over your fire insurance policies and figure how far the coverage would go toward replacing buildings? You might want to increase the coverage. If you had enough life insurance 10 years ago, you will now need about double the amount to give your survivors the same purchasing power.

**BRICKBATS:** Consumers have little love for farmers. They are told and they believe that farmers are getting rich. They do not understand that while U. S. net farm income in 1947 was 18 billion dollars, it dropped to 13 billion dollars in 1950 although hourly earnings of factory workers were 18% higher in 1950 than in 1947. Consumers, for 19% of their income, can buy the same amount of food that required 23% of their average income in 1935-39.

Meantime labor unions are practically invited by government to seek pay raises apparently under assumption that workers are entitled to more whenever living costs increase. Government thinking about food prices seems to follow entirely different line. Because food looms large in living costs and because no one dares to put an effective ceiling on wages, some politicians propose ceilings on farm products including those which are not up to parity. In bald language, the idea seems to be, "we have got to start somewhere; we don't dare start with wages, so let the farmer be the goat."

**MUD:** Ugly rumors claim that many Reconstruction Finance Corporation loans have been made on the basis of political favoritism and influence rather than merit. Here's a good question: Why should any government agency ever be in the banking business; or why should any government agency ever be in any business?

Washington, D. C. residents are concerned over crime situation. The city government is not elected, but headed by 3 commissioners appointed by the President. Dissatisfaction is reported with one commissioner claimed to be closely associated with a big liquor wholesaler. Washington has been characterized as one of the nation's worse cities, crime-wise. —H. L. Cosline

## The Song of the Lazy Farmer

A WOMAN is the strangest thing the Lord has ever made, by jing. I've never lost my wonderment, in spite of all the years I've spent in close relationship with one, observing crazy things she's done. No man would ever lay down laws and use for reason. "Just because . . ." Nor would we tramp for miles on end to save a dime on what we spend for groceries, and then, after that, pay thirty dollars for a hat; or buy a bunch of clothes today and take 'em all back right away, just 'cause somebody else has got the same stripe, check or polka-dot.

A woman takes more time to dress, despite the fact she's wearing less, than any man would ever use if he first had to make his shoes. She spends an hour upon her face, with tubes and jars all o'er the place; but if you took that long to shave, she'd really start to rant and rave. But, whoa! it's silly as can be to let such business worry me; no matter how old

you should grow or where in this world you might go, not even as an Arab sheik, with thirty new wives ev'ry week, could you expect to figure out just what a woman's all about.

# rarin' to go!

ESSO STANDARD OIL COMPANY

## Hoosier farmer says... "Swift's New Process Blenn

**produces high yielding, quality soybeans"**

*"I have been using BLENN on soybeans for the past few years with excellent results. When not limited by weather and weeds, I have found BLENN will consistently produce 30 bushels or better of quality soybeans per acre.*

*"BLENN safeguards our crops. Its completeness produces high quality and early maturing soybeans and small grains."*

*Adlai Wolf,  
Reynolds, Indiana*

Mr. Wolf's experience with BLENN, Swift's specialized crop maker, has been duplicated by thousands of other farmers who raise soybeans, corn and small grains. It helps them get bigger yields of better quality.

Here's why BLENN works so well. Feeding BLENN to crops is like feeding a good supplement to livestock. The growth elements in BLENN balance the natural plant nutrients in your soil. Then your crops get all essential growth elements needed...and that means higher yields; improved quality, and more money from every acre.

**BLENN is chemically hitched**  
New Process BLENN is made by an exclusive method developed by Swift. Complete mechanical mixing is followed by complete chemical processing. All growth elements in the formula become chemically hitched together in each granule. Growth elements can't separate out as your planter joggles over the field.

### More uniform 4 ways

Swift's New Process also makes BLENN more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform distribution through your machines; 3) uniform freedom

from caking, lumping, bridging; 4) uniform feeding of your corn and other crops.

You'll want to make sure you get all the New Process BLENN you'll need for your corn and grain crops. Shortage of plant food materials is again a possibility. So see your Authorized Swift Agent or dealer right away and order your BLENN.

### Do your pastures need fertilizing?

Do you know how you can tell what plant foods can do for your pastures? Think back to last spring. Remember how the pasture was spotted with small areas of greener, taller, more lush grass?

Those areas had been fertilized—by manure from the cows. Commercial plant foods can do the same thing for your whole pasture.

To help you grow better grass America's greatest crop—we have prepared an informative new booklet, "A Guide to Better Pastures." We'd like you to have a copy. Please write to Swift & Company, Plant Food Division, Chicago 9, Illinois, and we'll send your copy. This booklet is free!

## Some Advances in Chemical Weed Control

By JOHN VanGELUWE and ERNEST MARSHALL

**W**E ARE SURE you will agree that weeds are a problem on your farm. Weeds and brush present a problem on every type of farm in the Northeast, whether it be in corn, grain, vegetable crops, or even in the commercial orchard.

The phenomenal growth of chemical weed control practices which has taken place during the past few years has markedly changed cultivations and farming practices in many areas of the United States. During the next few years, northeastern farmers will see even more rapid advances in chemical weed control. Out of this will come a demand for more and better equipment built especially for chemical weed and brush control. The conventional sprayer to which farmers were accustomed was designed for high-gallonage, high-pressure spraying of fruits and vegetables. Such equipment was not versatile enough to handle the different demands placed on sprayers by new chemical weed control practices.

### Special Equipment

Many of the new weed killers are of the hormone type, and for safe use have to be applied at very low gallonage rates, such as 5-6 gallons per acre. Thus a demand was placed upon industry to develop sprayers capable of applying these low gallonages. They also had to be able to apply higher gallonages when used with weed killers which need greater amounts of water as carriers for most effective action. The challenge to industry was accepted, and today we have equipment designed especially for this type of work.

Breaking this equipment down we find four principal parts—pump, tank, boom and nozzles. Each part has several points which must be taken into consideration.

**THE PUMP** is the heart of the system. It controls the pressure and volume of material being used. Several points are very important when considering the pump for sprayers which are to be used for weed control work. It should be made of non-corrosive metal and, in the Northeast, versatile enough to handle gallonages varying from 2 to 40 gallons per acre. The pump must be built so that its efficiency does not drop off too rapidly after some use. These pumps vary in the manner in which they are attached to the outfit. They may be driven direct from the power take off, by a V-belt attachment, or by a separate gasoline motor. In general, pumps are of four types: rotary, centrifugal, rubber impeller, and piston type. Information concerning them can be obtained by writing companies that handle the various types.

**THE TANK** or tanks act as the reservoir. It is desirable to have the tank large enough so it need not be refilled too often. It must be made of metal, preferably non-corrosive metal. On the farm, standard 55-gallon drums are often used for this purpose. Wooden tanks should never be used for weed control sprayers, since it is practically impossible to clean thoroughly the hormone type weed killers from them.

### A Rigid Boom

**THE BOOM** needs to be constructed relatively rigid so that it does not swing or whip during operations on rough or hilly ground. A good type of boom is one that is both folding and adjustable, so that it can be easily transported and readily adjusted in height above the ground. The boom may be mounted either in front or behind the tractor. A rear mounted boom is gen-

erally preferable because vapors and fumes of the materials being applied will not bother the operator.

**THE NOZZLES** most generally used on weed control equipment have a flat spray pattern. This type of nozzle gives a uniform pattern and thorough coverage. Volume of application can be changed by changing either the complete nozzles, or in some cases, just the replaceable tips. Complete lines of nozzles of different angles, volumes and types are carried by several suppliers. These same suppliers publish charts showing rates of speeds to use, type and size of nozzles for various weed control jobs.

Ground sprayers can be mounted on several pieces of equipment. The most common method is to mount the sprayer on the farm tractor. This usually requires the least investment. Large commercial operators very often use jeep or trailer mounted sprayers. Some types of weed sprayers are mounted on a separate chassis and are fixed so that they can be attached to a tractor or jeep as a trailer unit. This type of sprayer sometimes has a separate engine to drive the pump.

Those, in general, are the basic requirements for weed control equipment. Weed control machinery is relatively inexpensive when compared with most other farm implements.

Uses for these sprayers will increase so that with the inevitable expansion of chemical weed control, they will be a multi-purpose machine suitable for use on many crops and for many purposes. Every year new crops are added to the list that can be sprayed for weed control. As new materials are introduced, the farm weed sprayer will become an indispensable piece of farm equipment.

Last year, army worms invaded southwestern New York State in large numbers and threatened to destroy crops in that area. Sufficient conventional spraying equipment was not available to the farmers in the area and was too expensive to purchase for that one outbreak. However, there were local supplies of inexpensive weed sprayers available which the farmers purchased and used effectively to combat the threatened disaster.

Low volume equipment also appears to have a future in the application of concentrate insecticides. Work conducted by various experiment stations indicates that certain insects can be controlled with insecticides applied in low volumes of water and under low pressure. It is foreseeable that in the future large areas of forage crops will be sprayed for insect control with this type of equipment. High volume application is not feasible so that, of necessity, low volume equipment will be used. Thus the low volume weed sprayer will become more and more a very profitable piece of farm machinery.

During this and the next few years the northeastern farmer can profitably consider weed spraying and the equipment that accompanies such an operation. This offers an excellent method to conserve farm labor. It is exceedingly important that a farmer examine the equipment available and correlate this with his individual needs. He must purchase the equipment which most suitably fits his current and future needs in weed control and low volume spraying.

— A. A. —

A common cause of spark plug failure is a broken insulator, caused by careless installation or accident.

# "First the blade, then the ear..."

*It will soon be spring again.*

Farmers are getting ready to prepare and plant their fertile fields. Now the grass is greening over some of our range land. Lambs, calves and pigs are being dropped. From winter rains and late snows comes the moisture needed for good growth. Again, America has promise of abundant food production.

This year abundance of livestock, grains and other foodstuffs is needed—as seldom before in our history. For a national defense program, like an army, "travels on its stomach." At home and abroad our armed services will require great quantities of food. People must be well fed to work at peak levels.

*Production of food on such a gigantic scale will put a heavy strain on our land . . . not only this season, but far into the future.*

So the conservation of our soil's fertility and of our water resources is more important now than ever before. We can not afford the luxury of waste. Fortunately, farmers and ranchers know how erosion can be arrested. How our watersheds can be preserved. How with proper conservation practices they can maintain soil productivity at present high levels . . . And how we can reach even higher levels of food production in the future.

In this emergency the use of conservation methods fitted to individual farms and ranches is a must. We believe that thus the nation's farmers and ranchers can contribute in full measure to our national strength.

## Soda Bill Sez . . .

Backbone is fine—unless the head at the top of it is made of that same stuff.

Cheer up! Yesterday's gone and tomorrow hasn't arrived yet.

## Martha Logan's Recipe for

### LAMB SHOULDER WITH MINT STUFFING

To roast lamb shoulder well done, allow 35 minutes per pound. The average shoulder weighs 4 to 6 pounds.

#### MINT STUFFING (Yield: 4 to 6 cups)

10 slices bread, broken in small pieces	2 teaspoons poultry seasoning
1 medium apple, chopped fine	
2 tablespoons celery finely chopped	1½ cups (about) fruit juice or water
1 tablespoon chopped dried mint leaves	

Mix all ingredients in large bowl. Place stuffing on brown paper which has been rubbed with shortening and placed on a rack in a roasting pan. Put roast over the dressing, fat side up. Roast in a slow oven (325° F.) about 2½ hours.

## OUR CITY COUSIN

"When that March wind blows full force, I can see he's a draft horse!"

## Business Know-How Is Needed

In America little business and big business make a team that is hard to beat. In many industries little businesses make the parts which big business assembles into big, complete, finished products. Working together in this way, business as a whole has developed the "know-how" that gives our nation its mighty productive strength.

To me, it is essentially American to start little and grow big. Swift & Company is a good example of what I mean. Gustavus Swift started in a small community. He bought a heifer and sold the meat personally from his original red wagon. As he gained "know-how" his business thrived. Later his sons worked with him in developing a service essential to a growing nation. Today, little companies still grow big—and the combined know-how of all business is one great bulwark of our defense.

When national emergencies arise, where except in business would you find the trained manpower to handle problems of production and distribution? Managers of business readily accept a dual responsibility. They become responsible for handling in their own companies the special problems created by the emergency. They put their combined business know-how to work to keep America strong.

It is my conviction that we Americans live better because there are both big and little businesses. I maintain that business know-how develops as businesses grow . . . and that such know-how is essential to the defense of all the big and little things for which we Americans stand.

*F.M. Simpson.*

*Agricultural Research Dept.*

## Quote of the Month

"Our plans for the coming year must be based upon the greatest possible production. That must be the keynote for farmers and stockmen . . . It's crystal clear that . . . in 1951, an ample supply of food is essential for victory. All-out food production is our job. Plan it that way."

Nelson R. Crow, *Publisher Western Livestock Jrl.*

## Milk Veins Not Reliable Indication of Milk Production

by W. W. Swett,  
Dairy Husbandman, U.S.D.A.  
Bureau of Dairy Industry,  
Washington, D. C.

*W. W. Swett*

An abundance of "milk veins" does not appear to be essential for superior milking performance in dairy cows. Neither is it necessary for heavy-producing cows to have large "milk welis" or a network of veins on the surface of the udder.

Although the importance of these characteristics has been stressed for many years in classrooms, show rings and barn lots, recent studies indicate that there was no significant relationship between them and the amount of milk produced by Holstein or Jersey cows in the herd of the Bureau of Dairy Industry, at Beltsville, Md.

It was found, particularly with Holsteins, that the veins on the surface of the udder were more pronounced on udders that were tight, compact and closely held to the body than on the loose, flexible type of udders that are considered by many as of superior "quality." This raises the question of whether or not the veins on the surface of the udder may be the result of faulty circulation and possibly objectionable.

Detailed studies of the dissected arteries and veins of a high-producing cow indicate that the internal veins are large enough by themselves to carry away from the udder all of the blood brought to it by the arteries. This being the case, the lack of any significant relationship between "milk veins" and milk production is not surprising.

## Food Factory Runs on Grass

A steer is a food factory that turns feedstuffs into meat—efficiently, economically. It manufactures grass, hay, roughages and grains into tasty, nutritious meat . . . Some folks see our steer differently. They say it is a grain burner. That's because they don't know the facts. Here is what it takes to make a 1,200-pound steer—10 to 15 tons of grass; ½ to 1 ton of hay; 200 to 250 pounds of protein supplement; only about 60 bushels of corn. By far the most of this feed is material unfit for human use. People cannot eat grass, hay or roughage. Protein supplements such as meat scraps, cottonseed or soybean meal also are not good human food. Half of our country is in grass, which would have little value if it were not fed to livestock. The basis of meat production is grass, hay and forage.

# LEAGUE URGES 3-POINT PROGRAM To SAFEGUARD NATION'S FOOD SUPPLY

## Says Gov't Ignores Food-Production Problems in Re-armament Program

Shocked by the government's indifference toward problems of food production, the 24-man Board of Directors of the Dairymen's League has gone on record with a declaration that "farmers are discouraged and distressed by lack of planning in Washington necessary to assure all-out food production."

To remedy a dangerous situation, the League Directors urged adoption of a 3-point program calling for:

- 1—immediate action by government officials to lessen the drain on the farm labor supply;
- 2—appointment of recognized farm leaders to advisory and policy positions in the government;
- 3—abandonment of all thought of agricultural subsidies to farmers.

As evidence that the nation's food needs are being ignored, the League's Board pointed out that men experienced and skilled in the care of farm animals and the operating of costly and complicated farm machinery are being drafted, while others are yielding to the lure of high industrial wages. Little thought is being given to the need for replacement parts in farm machinery. And in contrast to high beef prices, the price of milk is so out of line that good dairy cows and heifers are being sold for slaughter.

### Subsidies a Fraud

Subsidies are a fraud upon both consumer and producer, the statement declared. They generate a false sense of the value of food, and lead consumers to believe that the subsidized prices are the real and only price. Whereas actually there is a hidden cost in all subsidized prices that must be paid in taxes, including the exorbitant and unnecessary burden of bureaucratic administration. Subsidies threaten the food supply because they cast farmers in role of charity wards, and impose controls and regulations that are distasteful. In short they are a step toward the very dictatorship we are arming to prevent.

## Solid - Drilled Silage Crops

By GEORGE SERVISS

**S**OME interest in solid drilled silage crops develops almost every year. Most of this interest seems to arise from the desire of farmers to find a crop that will produce as much silage to the acre as corn, and of about the same quality but which will not require cultivation. Part of the interest also arises from the fact that there would be less erosion on much of our sloping land with a solid drilled crop than with a cultivated row crop.

Part of the answer to saving labor in cultivation is through the use of chemical weed killers, except in situations where the principal weeds are quackgrass, nut grass or other resistant weeds. Most broadleaf weeds are easily and cheaply killed, and with 2,4-D. We are not going to throw the cultivator away, but the regular use of chemical weed killers, where they are recommended, will give better control of weeds, reduce the number of cultivations necessary, and result in increased yields.

### Crops to Grow

The logical choice for an annual solid drilled silage crop would be made from the following: sorghum, the millets, sudan grass and mixtures of these with soybeans. Sorghum is the crop that would most nearly approach corn in yields. In hot, dry years in the southern part of AMERICAN AGRICULTURIST territory it would be very likely to equal corn in green weight yields.

While the silage made from it is quite palatable to stock, ton for ton it has only about three-fourths the feeding value of well-cured corn silage. The sweet succulent varieties (commonly call sorgo) are the ones generally used for silage in the northern part of the country. These would be the ones to use in the northeast.

Japanese millet is the best of the millets for silage purposes. It is also the best to sow on late, wet soils or at high altitudes where the weather is cool throughout most of the growing season. Under the conditions mentioned, we would not plant it in combination with soybeans. The quality of the resulting silage for feeding purposes is fair. In our opinion, though, it makes the best feed of any of the millets. German or golden millet often yield more where the drainage is good, but do not make as good feed.

Sudan grass is often used for silage, but the results have not been consistently satisfactory. It is probable, though, that the sweet varieties would make a more satisfactory silage than the common since they are more succulent. Sudan grass, like sorghum, is a hot weather crop and does best on well drained soils in seasons when summer temperatures are above normal. Sowing it in combination with soybeans improves the value of the silage but usually results in somewhat less yield.

Where soy beans are planted in combination with any of the crops mentioned, the usual practice is to plant one bushel of soybeans per acre plus one-half of the normal rate of the other crop.

The Champ—and his corn.

## 134.54 Bushel Yield Wins

A WESTERN New York youth who had never before grown field corn walked away with top honors in New York state in the DeKalb National Corn Growing contest. At a banquet in Syracuse, honoring outstanding accomplishments in corn growing, Bruce Acomb, 21, RFD 1, Dansville, Livingston County, N. Y., was crowned Corn King for the 1950 season. His winning yield was 134.54 bu. per acre (shelled corn basis).

The naming of Acomb came as the seed organization honored high entrants in the event from 29 counties in the state. Principal speaker at the dinner was Ray Nelson, assistant general manager of the DeKalb organization who came from Illinois to honor the growers.

The 21-year-old bachelor farms more than 200 acres in the fertile Canaseraga flats of the Genesee country. Bruce carries on a cash crop operation; maintains fertility by rotation and use of fertilizer. The championship field was planted with DeKalb variety 406, a full season type. The field contained 11 acres, only 5 of which was necessary for entry in the contest. Young Acomb planted his corn in 35 inch rows and the spacing in the row measured 10½ inches at harvest. Three hundred pounds per acre of 5-10-10 were used to fertilize the crop.

### County Winners

The other county champions in the DeKalb contest, listed in the order of their yields, were:

Loren Heinzman, Ontario, 122.83; William Wolfrum & Son, Rensselaer, 121.94; Sholtz Brothers, Oneida, 120.98; Burt Bobzien, Niagara, 118.98; Amber H. Towne, Onondaga, 117.50; Warren D. Johnson, Orleans, 112.67; Harold Jepsen, Yates, 110.54; Irving Fleming, Columbia, 107.45.

Wellington W. Porter, Seneca, 101.71; William J. Argersinger, Madison, 101.56; Fred E. Kulow, Wayne, 100.75; Clark Welch, Oswego, 100.57; Allan C. Brownell & Son, Washington, 100.22; Taylor Brothers, Wyoming, 95.23; William J. Fisher, Monroe, 94.30; Ball Brothers, Cayuga, 93.35; Harry D. Quick, Ulster, 91.79; R. W. Shaver & Kenneth Daley, Dutchess, 88.17.

Jacob Thomas, Chemung, 86.89; Fred C. Hanford, Tioga, 86.23; Totten Brothers, Genesee, 77.46; Robert Delling, Erie, 77.09; John N. Wolf, Chautauqua, 75.73; William D. Hopkins, Steuben, 74.48; John Waring, Cattaraugus, 72.74; Clyde Nellis & Son, Montgomery, 70.39; Joseph J. Gorsky, Saratoga, 60.14; John H. Bradbury & Son, Herkimer, 53.81.

New Holland "77" twine-tie baler handles up to 10 tons of hay an hour! It's the highest capacity baler available today.

## "To get faster baling at lower cost you can't beat NEW HOLLAND!"

says R. WALTER HURLBURT,  
Berkshire Co., Mass. 1950 Winner—  
All New England Green Pastures Contest

**WALTER HURLBURT**, Holstein breeder, with Hurlwood Admiral Burke Lad No. 1112103—1st prize yearling bull at 1950 Eastern States Exposition. Modern farming methods have upped his grain-milk ratio 1 to 6 in winter, 1 to 8 in summer. He knows, too, the importance of good hay machinery—"I've used New Holland balers since 1942!"

### TROUBLE-FREE BALING WITH CERTIFIED TWINE

The United States Testing Co. has awarded its Seal of Approval to New Holland Twine for meeting its rigid

standards of uniformity, quality and strength. Farmers everywhere agree you can't buy a better twine.

### SOME OF THE EXCLUSIVE "77" FEATURES

**A CARLOAD AN HOUR!**  
The "77"'s remarkable capacity saves valuable man-hours. When the hay is ready, you bale it fast!

**COMPRESSION-TIED!**  
Bales stay tied in spite of rough handling. Fewer losses through breakage.

**ROLL-AWAY CHUTE**  
Slides bales well away from wheels and allows closer windrowing.

**INVERTED KNOTTERS**  
prevent clogging by dust, chaff. Hundreds of bales tied without a miss.

# 10 Facts to remember about **NATURAL** **CHILEAN NITRATE**

- 1. Natural.** Chilean Nitrate is the only *natural nitrate* in the world.
- 2. Nitrate Nitrogen.** The nitrogen is 100 per cent *nitrate*.
- 3. Sodium.** Chilean Nitrate contains 26 per cent *sodium*, equivalent to 35 per cent sodium oxide. Sodium is *essential* to maximum yields. It substitutes for potassium, where lacking, and makes soil phosphate more available. It also improves the vigor and feeding qualities of forage crops.
- 4. Iodine.** Chilean Nitrate contains *iodine* to help meet the needs of plants, animals, and human beings.
- 5. Other Plant Food Elements.** Chilean Nitrate contains *natural* traces of many other elements that contribute to strong, healthy plant growth.
- 6. Ideal Condition.** Chilean Nitrate comes in *free-flowing* pellets—easy to handle and to apply.
- 7. Quick-Acting.** Chilean Nitrate is *completely* available.
- 8. Anti-Acid.** Chilean Nitrate helps keep the soil *sweet*.
- 9. Time-Tested.** Chilean Nitrate has been *proved* by more than 100 years of research and farming.
- 10. Doubly Profitable—Economical.** Chilean Nitrate improves the *quality* of crops as well as the yield, making it doubly *profitable* and *economical*.

## Roy McPherson—Fruit Grower and Friend

By JEANNE PONTIUS RINDGE

WESTERN New York has lost in the death of Roy Pierson McPherson of the Oatka Trail, near LeRoy, a modern pioneer who, like his own orchards famed for their quality, combined the best traditions of the past with the sanest aspects of modern progress.

Mr. McPherson's ancestors settled this land near the Big Springs (Caledonia) one hundred and fifty years ago. He lived almost all his life in the rambling colonial farmhouse built by his great-grandfather above the winding Oatka. His 25 acres of apple or-

chards nestle upon a hill-surrounded plateau high above the creek.

A staunch Presbyterian, as were his Scotch ancestors, Mr. McPherson never sold an apple on Sunday. Even so, almost all the crop was sold from the barn direct to the customer. Those who forgot his Sabbath rule were forced to return—often long distances—on another day. They usually did.

With farmers such as Roy Pierson McPherson was, both our agriculture and our way of life will be in safe hands. May his influence spread.

— A. A. —

## TRUCKS, REAL ESTATE AND HIGHWAY COSTS

AN INCREASE of \$2,000,000 in their property tax bill faces the 85,000 farm-owning members of the G.L.F. unless highway-user fees are equalized by an increase of taxes on heavy trucks. James W. Harnach, GLF's traffic counsel, gave this estimate recently, based on using the money raised from higher truck taxes in increased state aid to local communities. An engineering survey, by Griffenhagen and Associates for the Citizens Public Expenditure Survey, had revealed that the big commercial vehicles pay less than one-fourth as much in highway-user fees as passenger cars.

Proposed legislation, being considered by the Joint Legislative Committee on Highway, Canals and Revenues (Senator George T. Manning, chairman), is designed to make heavy trucks pay for the use they make of the roads at a rate nearer that which passenger cars and light trucks pay.

"The state cannot afford to increase its highway aid to local government unless it raises taxes some place," Mr. Harnach said. "The fairest source of additional revenue seems to be the heavy truckers who are not paying as big a share of the fuel and license taxes as they should be paying."

"If the big truckers do not contribute more of their share of the cost of the highways in this state, then the property owners are going to have to carry a heavier burden than they now carry."

"GLF owns more than 550 trucks and pays taxes on property in 52 of the 57 counties in New York," Mr. Harnach went on. "So we shall have to pay more either way. Although GLF would benefit more—superficially, anyhow—by an increase in property taxes than by a rise in truck taxes, our consideration must be primarily for our membership. And our membership would be hit hard by an increase in property taxes."

This year's dates for Farm and Home Week at Cornell are March 19 to 23.

## A Self-Service Stand

A novel self-service roadstand that attracts paying customers is this one on the Wendall Hall farm at Cape Vincent, N. Y. The artistic touch, applied by Mrs. Hall, stops cars by the scores. At the end of the day the small cash box is usually full — the farm-produced vegetables and fruits gone. Incidentally, the signs unhook so they can be changed, depending on the supply of produce.

The attractive lady on the right of the wagon wheeled cart was created out of an old post for the body, buttons for eyes, a spool for a nose, drain pipe arms, red and white plastic yardage for the dress and blouse.

## NO 'LOST QUARTERS' ON RENNEBOHM FARM SINCE USING PENSTIX®

MADISON, Wis.—“We haven't been losing quarters since using PENSTIX,” Clifford Jurgens, herdsman on the Rennebohm Farm here stated at a recent interview. He and his father, Arnold, manager of the farm, have been using PENSTIX for the treatment of mastitis since they first appeared on the market two years ago.

Farming 285 acres with 107 registered Holsteins, Clifford Jurgens finds PENSTIX easy to use, easy to keep on hand. He says, “At the first sign of mastitis we insert two PENSTIX into the infected quarter and then follow this up with one insertion every twelve hours. Often the infection clears up completely in less than two days. Never takes more than three in the more serious cases.”

Commenting on PENSTIX-SM bougies, the new combined antibiotic treatment, combining penicillin and dihydrostreptomycin in a single bougie, Mr. Jurgens said, “We are mighty glad to have PENSTIX-SM available, with streptomycin added, especially for treatment of severe infections. But for most cases of mastitis, I don't see how you can beat PENSTIX.”

### WYETH'S PROVEN PRODUCTS FOR MASTITIS CONTROL

- PENSTIX penicillin bougies or PENSTIX-SM, penicillin-streptomycin bougies, (the combination antibiotic treatment for more severe infections) are available at your drug, feed or Animal Health Products store.
- For cows with dry quarters, or with more deep seated infections, many dairymen prefer WYETH PENICILLIN OINTMENT or PENICILLIN-DIHYDROSTREPTOMYCIN OINTMENT, in handy easy-to-insert tubes. Write Wyeth for your FREE mastitis booklet.

## Seed Treatment--

### What It Can and Cannot Do

By G. F. MILES

**S**OME microscopic organisms in the soil neither help nor hinder the farmer in his efforts to grow crops. Others are so helpful and so important that without them crops could not be grown. The nitrifying and the nitrogen-fixing organisms are examples of this group.

There is still a third group of micro-organisms, many of which are not well known except by the harm they do to seeds and plants. There are the parasitic organisms that attack planted seeds and seedlings, causing the seeds to decay and the seedlings to damp-off, blight, and often die.

These parasitic organisms are hardy. They can thrive in all soils, surviving the freezing of winter and the heat and drought of summer. We cannot kill them without at the same time killing the friendly organisms essential for the growth of plants. Our only recourse then is to learn to grow our crops in spite of these pests in the soil.

### The Danger Point

The planted seed begins to absorb water from the soil, which softens the seed coat. The seed coat ruptures and the tiny sprout and roots push out into the soil. This is the big moment for which the enemy has been waiting. They move in to attack the defenseless seed and seedling.

If the attack is vigorous, the young sprout, the roots, and the stored food may be quickly destroyed and reduced to a rotted mass. The result is obvious—no seedling from that seed and a miss or skip in the stand.

If the attack is less vigorous, the seedling may survive, but much of the stored food will be destroyed by the enemy invaders. In that case the seedling must struggle along as best it can on a reduced portion of stored food. That means a seedling slow to emerge from the soil and weak in growing ability after it does emerge.

In this battle between the germinating seed and its parasites, the seed often fights at a disadvantage. Conditions unfavorable for germination, such as low soil temperature, or too much or too little soil moisture, retard germination and prolong the very critical period during which the seeds and seedlings are subject to attack. In such cases more and more seedlings will succumb in the battle; and the resulting crop stand will be poor, scattered, and unprofitable.

### Seed Treatment Protects

Now let's see where chemical treatment of the seed fits into the picture. Suppose man intervenes in the struggle and takes steps to handicap the parasites. He can do this by coating the seed with a chemical which is toxic or poisonous to the parasite but harmless to the seed and seedling. This chemical protective barrier kills the nearby parasites; or at least checks their attack until the seed can germinate and the seedling can emerge above ground and become established.

Having attempted to show what seed treatment does and how it accomplishes this result, I would like to make the situation still clearer, if possible, by reciting some of the things we cannot expect chemical seed treatment to do.

1. Seed treatment is not a fertilizer or nutrient. It does not feed the germinating seed or seedling—it protects it.
2. So far as we know, seed treating chemicals do not stimulate or speed up germination or growth. There may be exceptions to this statement, but it is hard to believe that stimulation is an important factor in the benefits accruing from seed treatment.
3. Seed treatment does not improve

### Brambles

Carl S. Bittner, Pomology Specialist at Pennsylvania State College, advocates the use of cover crops in raspberry culture. He says prompt removal and burning the old canes will permit better development of new canes and also aid in disease control. Since old canes left in the field compete with the new ones for soil nutrients and water, he suggests old cane removal and planting of cover crop.

The cover crop helps prevent erosion and increases organic content of the soil. It serves as a sort of check-valve on belated growth and maturity of the new canes. Millet and sudan grass are cited as the most popular cover crop, but he points out that domestic ryegrass is also extensively used. Essential to the best growth of the cover crop, in his opinion, is thorough but shallow cultivation as soon as the canes are removed. Superphosphate or mixed fertilizer carrying both phosphate and potash will encourage growth of cover crop. High nitrogen fertilizers or manure should not be applied to the cover crop because they encourage late growth and immaturity of the canes.

\* \* \*

L. P. Latimer, University of New Hampshire, discusses red raspberry culture in Extension Circular 264. Whether or not to fertilize raspberry plants may be determined by the previous growth of the plants. Unless the soil is very sandy, manure is the only fertilizer advised at time of planting, using 8 to 10 tons in late fall or early spring. The following amounts of commercial fertilizers may be substituted for manure after the first year if they are necessary: 100 lbs. nitrate of soda, 200 lbs. tankage, 200 lbs. acid phosphate, and 200 lbs. sulphate of potash. Apply about the time growth starts in the spring.

\* \* \*

Raspberries and blackberries succeed on a variety of soil types if the soil is abundantly supplied with organic matter and plant food, and is well drained, according to Indiana Horticultural Specialists. Where it is impossible to secure animal manure, green manure crops such as soybeans, cowpeas, clover, lespedeza, or alfalfa may be grown on the land the year, or preferably several years, before setting the plants. If the soil is low in organic matter, postpone commercial planting until a succession of green manure crops has been worked into the soil. The soil-building crops should receive from 300 to 500 lbs. per acre of a fertilizer supplying 4% to 8% nitrogen, 8% to 12% phosphoric acid, and 6% to 10% potash.

### Strawberries

In Massachusetts Extension Leaflet No. 29, "Strawberry Growing," the specialists say, "Commercial fertilizers have produced little response on medium loam soils well filled with organic matter. If sufficient phosphorus and potash have been used in the rotation to supply the needs of the other crops, there will be enough for the strawberries, while decomposing organic matter will take care of the need for nitrogen. On light soils there is evidence that applications of phosphorus and potash may be beneficial. More nitrogen will also be needed, so it may be advisable to harrow in 1,000 lbs. or so per acre of a complete fertilizer such as a 5-8-7 before the plants are set."

\* \* \*

Strawberries grown on sandy soils of New Jersey often require a spring application of fertilizer to maintain plant

vigor and increase production. On the heavier, more retentive soils, spring fertilization does not seem to be necessary provided the plants were well fertilized during the previous season. Strawberries can be over-fertilized during the spring of the fruiting year. It appears that the application made during March or early April should not be in excess of 500 to 600 lbs. per acre of 5-10-5 or 5-10-10 fertilizer. Excessive fertilizer on the fruiting field will delay ripening, encourage rot, and cause soft berries of poor shipping quality.

### Grapes

In discussing soil management and fertilizers, Professor O. C. Roberts of the Massachusetts Extension Service says that the soil management program in the well-managed vineyard consists of clean cultivation from early spring until about the middle of July, when a cover crop of barley or buckwheat should be sown.

Benefits from the use of fertilizer vary so greatly, depending upon the type of soil, that no specific formula can be recommended for all vineyards. If barnyard or hen manure is not available, nitrate of soda applied at the rate of 200 to 250 lbs. per acre is a suitable substitute.

On most soils an annual application of 10 tons of manure per acre should be sufficient. In addition, superphosphate at the rate of 300 lbs. per acre and muriate of potash at 75 lbs. per acre are regarded as normal applications and are recommended.

### Blueberries

Problems in growing cultivated blueberries are discussed by John S. Bailey in the 54th Annual Report of the Massachusetts Fruit Growers' Association. On the subject of management and fertilization, Bailey points out that recently there has been a marked tendency to change over to the mulch system.

Mulching has the advantage of eliminating cultivation with its possible injury to the roots, adding considerable organic matter, conserving moisture, and at least in the case of hay mulches, adding nitrogen, potash, and other minerals.

Cultivated blueberries, he points out, respond best to a complete fertilizer. A 7-7-7 mixture has given good results when applied at the rate of 600 to 1,000 lbs. per acre on fully matured, bearing bushes.

\* \* \*

In New Hampshire Extension Circular 275, W. W. Smith discusses culture of low-bush blueberries. He points out that due to continuous harvesting and burning, some of the older blueberry fields have become non-productive, with the plants so weak they will not support a fire. In many cases, applications of 200 to 400 lbs. per acre of a 7-7-7 fertilizer have invigorated the plants and increased their growth and fruit yields.

But here is a word of warning about fertilizing blueberry fields. Do not apply fertilizer unless the plants are very weak. Fertilizer will make weeds as well as blueberry plants vigorous, and the weeds may grow and choke out the berry plants. Fertilizers for blueberries should be applied in May or early June.

## have GREEN FEED the year 'round

Green-cut forage is actually a protein concentrate. Protein content often exceeds 20 percent in legume or grass silage made with the Allis-Chalmers Forage Harvester.

Harvest standing green forage with mineral-rich leaves. Save it all, with your own wide-throated, big capacity Forage Harvester. That's your answer to rain spoilage of hay.

The Forage Harvester's power-saving, cup-shaped knives are spiraled to give easy-shearing, cut-and-throw action. It delivers clean-chopped forage to a trailing wagon. A new rear bumper attachment permits easy loading into trucks. Power takes the crop all the way from field to silo.

Now you can follow the ideal soil-building system, with more legumes and grass. Give your cows longer lactation life, more high-carotene feed. The efficient Allis-Chalmers Forage Harvester can be the most welcome machine on your farm. Ask your A-C dealer about it.

Listen to the National Farm and Home Hour  
Every Saturday — NBC Network.

### FORAGE HARVESTER

Three harvesters in one with: (1. Grass sickle-bar attachment 2. Windrow pickup for sickle attachment 3. Row-crop attachment). The Allis-Chalmers Forage Harvester provides your choice of harvesting methods. Advanced labor-saving design includes built-in knife sharpener.

### Auxiliary engine

available for use with tractors smaller than two-plow rating. Engine is easily interchanged with other A-C harvesting machines.

### FORAGE BLOWER

Has big nine-inch pipe capacity to match the Forage Harvester's tonnage. Special curved fan blades save power and fuel, throw into highest silos. Big, spring-balanced conveyor is easily raised for wagon or truck to drive through for power unloading.

## It's Handy

### MOISTURE IN GASOLINE

Here is my experience in preventing moisture trouble in my gasoline tank. It may be helpful to other subscribers. I keep my gasoline tank always full during the winter months. This greatly decreases the amount of moisture laden air in the tank and the chances for moisture condensing are greatly decreased. This is especially important if the car is kept in a heated garage before being taken out into the cold. This will prevent many a stop in zero weather and sometimes a tow to a garage to thaw a frozen fuel line.

—I.W.D.

— A.A. —

### MARKING OFF GARDEN ROWS

Instead of bothering with a ball of twine or a tape measure to mark off garden rows, I use a measuring stick to mark the distance between rows, then I place a marker at each end and run a wheelbarrow down the row keeping my eye on the marker ahead. At the end of the row I turn around and go back up the next row the same way. I found I could do this in as little time (and less bother) as it took to wind up the tape measure or move the twine around. On a windy day the twine often blows around, making it difficult to make straight rows.—Irene Howland, West Milan, N. H.

— A.A. —

### DRAIN COVER

A short while ago I visited a farmer who was just putting in a new concrete floor in his milk house. Instead of purchasing a drain cover, he used a worn clutch plate from a Model A Ford.

—N. H. Foote, Farmingdale, N. Y.

— A.A. —

### WATER CARRIER FOR POULTRY RANGE

It isn't always convenient to pipe water to the poultry range, and hauling water is usually considered a time consuming job. But Arthur Hines of Lexington, Massachusetts, makes his job easier with this double barrel arrangement on his farm truck.

The oil barrels are supported and braced on the truck body with wooden blocks. Pipe elbows are fitted to the lower side of the barrels, as shown. Short pipe fittings and a faucet complete the arrangement.

Barrels are filled through opening in top with the aid of a hose or a high water pipe similar to the type used by fruit growers for filling spray tanks. Screw caps close all openings when barrels are filled to capacity to avoid spilling. Poultryman simply inserts hose in range waterers and turns faucet.

Opening shown in barrels are usually left open when filling or emptying to allow for passage of air. Hose drains from both barrels at once.—C.L.S.

## High Efficiency BEACON complete STARTER

Entrance to the 60-acre Beacon Poultry Research Farm.

## Now AVAILABLE with NITROSAL (On Order)

Faster growth, sturdier growth—better fleshing and feathering, fewer barebacks—strong bones and bodies—developed during those important first 8 weeks by Beacon Complete Starter ... Because Beacon Complete Starter is a *high efficiency feed*. Has high protein, low fibre and high energy content, and for the past year, it has contained a Vitamin B12 and anti-biotic supplement for greater efficiency, faster growth. On special order, it has been available fortified with an anti-coccidiosis drug.

### RESEARCH MAKES THE DIFFERENCE

The tested, proved basic formula of Beacon Complete Starter results from 29 years of painstaking research. Our experiments to date have shown that with the Nitrosal feed we get faster growth, higher feed efficiency, better pigmentation on skin and legs and greater uniformity in the flock. More than 80,000 birds are involved in these experiments, which are being continued.

### AFTER BEACON STARTER...

Reach for the ★ ★ ★ STARS\* at your Beacon Dealer's. Consult your classified telephone directory for the name of your nearest Beacon Dealer. \*Green stars on Sulfaguinoxaline and Nitrosal Feed Bags.

### MATCH BEACON STARTER'S RECORD (IF YOU CAN)...

The record shows that many Beacon feeders *average* less than 3 pounds of feed per pound of meat at weights of 4 lbs. or over per bird (9 to 12 weeks). Match Beacon Complete Starter for results with any other starter on the market.

## Fresh bog spavin?

"Clear it up fast with **ABSORBINE**"

says C. W. Pace of Longmont, Colorado

"As soon as I see signs of bog spavin, puff or soreness on my horses, I use Absorbine. That's the treatment advised by our veterinarian, and I have been using it for over 16 years."

Yes, farmers know there's nothing like Absorbine! It's not a "cure-all," but a time-proved help in relieving windgall, collar gall, and similar congestive troubles.

A stand-by for over 50 years, it will not blister or remove hair. Only \$2.50 at all druggists. W. F. Young, Inc., Springfield, Mass.

# World's First SINCLAIR Anti-Rust Gasolines WITH RD-119

"Here's the way to stop  
**GAS TANK RUST**  
from stopping your farm work!"

You can't stop moisture condensation in your gasoline tank! But you CAN stop it from forming rust—specks of which can clog up your whole fuel system, and cause hard starting, stalling, loss of work time. Yes, you CAN stop rust—with the world's first Anti-Rust Gasoline.

Condensation forms water in every gasoline tank. Water causes rust. Specks of rust can clog fuel lines, strainers, carburetor jets, when you use ordinary gasoline.

This Sinclair Gasoline now contains RD-119, the miracle rust inhibitor that forms an invisible, waterproof film throughout your whole fuel system.

Use Sinclair Anti-Rust Gasoline. It costs no more! Phone your Sinclair Representative today.

## Question Box

I plan to grow a few potatoes in my garden. Does green sprouting increase yields? How long before planting should it be started?

Green sprouting results in a quicker come-up, and therefore a better crop. Spread the uncut seed potatoes on the garage floor about two weeks before you expect to plant them.

Having moved to the country, I expect to grow a garden for the first time. There are five in our family. How big a garden do we need?

That will depend somewhat on your plans for canning, freezing or storing for winter use. One authority says, plan for an area 100 feet by 110 feet, which is about 1/4 of an acre.

What is the best way to apply commercial fertilizer in the garden?

That depends on several things. If the application is light, sprinkle it along the row before the furrow is opened. If you use a 5-10-5 fertilizer at the rate of a ton or two per acre (5 to 10 pounds per 100 square feet), it's a good idea to broadcast half of it before plowing and to use the balance in the row before planting.

How can I get strawberries to grow more runners and new plants?

By setting early on fertile soil, well supplied with humus, and by choosing a variety that tends to produce runners.

Often the real problem is to prevent too many plants. It's still a good idea to set new plants early, but to thin so that new plants which are allowed to grow are at least six inches apart.

What fertilizer should be used on home garden raspberries where growth has been unsatisfactory?

Use 6 pounds of a 5-10-5 per 100 feet of row this spring. It won't help this year's crop much, if any, but will help growth of canes for next year's crop.

What is the advantage of growing baby limas in the home garden?

It is a matter of personal preference. We like the large beans. We think they have as good quality and that it takes too long to shell the "babys."

Our rhubarb, which has been set two years, is not growing as it should.

Rhubarb is a heavy feeder. Put a double handful of fertilizer around each hill; also a shovel of rotted manure if it is available. If not available, peat moss will help to retain moisture in the soil.

Is it essential that fruit trees in a home garden be given a dormant spray?

It is one of the most effective sprays. It should handle peach tree curl and will kill many eggs of insects that would do damage later. As it is applied before the buds burst, it is about the only spray that can be applied effectively to trees by a bucket pump or knapsack sprayer. It just takes too much spray to cover a tree after the leaves are out.

What causes red raspberries to crumble when they are picked?

This is due to a disease called mosaic. Probably you should pull out the plants and start a new bed, being sure to buy plants free from the disease.

What fertilizer should I use on my strawberry bed this spring?

If you are talking about this year's producing bed, don't use any. If you plan to renew it, add 5 pounds per 100 square feet of a 5-10-5 after the harvest is completed.

## Injuries here

## Losses here

Teat injuries lead to udder injuries, resulting in lost quarters; lost production. To promote good udder health, provide prompt antiseptic protection for all teat injuries. To promote normal milk flow through the canal of injured teats, use Dr. Naylor's Medicated Teat Dilators.

## Economical Cough Relief! Try This Home Mixture

No Cooking. Makes Big Saving.

To get quick and satisfying relief from coughs due to colds, mix this recipe in your kitchen.

First, make a syrup with 2 cups granulated sugar and one cup of water. No cooking needed. Or you can use corn syrup or liquid honey, instead of sugar syrup.

Then get 2 1/2 ounces of Pinex from any druggist. This is a special compound of proven ingredients, in concentrated form, well-known for its quick action on throat and bronchial irritations.

Put Pinex into a pint bottle, and fill up with your syrup. Thus you make a full pint of splendid medicine—about four times as much for your money. It never spoils, and tastes fine.

And for quick, blessed relief, it is surprising. You can feel it take hold in a way that means business. It loosens phlegm, soothes irritated membranes, eases soreness. Makes breathing easy, and lets you get restful sleep. Just try it, and if not pleased, your money will be refunded.

## WHAT'S GONE BEFORE

Immediately after the marriage of Mark Wilson and his sweetheart, Ann Clinton, Mark leaves to join Abe Lincoln's volunteers. His younger brother, Charlie, runs away to join the army, and later his father, George Wilson, sells off his stock and joins the boys. When Ann's father, Fred Clinton, also enlists, it leaves Nancy Wilson and Ann with a hard time getting the farm work done on both farms and providing clothing for themselves and the younger members of the Wilson family. Enoch Payne, a neighboring farmer who works by the day, helps them out as much as he can. Henry Bain, who is in love with Ann and hates Mark, begins making frequent calls at Ann's home, in which he is encouraged by her mother. Nancy and Ann put on a little Christmas celebration for the sake of the children, during which Mark arrives unexpectedly on leave.

## CHAPTER XIII

AFTER the Christmas holidays and Mark's return to camp, the days gradually grew a little longer, but the winter settled down harder than ever. For the home folks the biggest problem now was to get wood for the fires. There was plenty of it on every farm; the difficulty lay in getting it cut and drawn out from the deep snow in the woods and worked up into the lengths that the stoves would take.

Both Nancy and Ann finally gave up trying to heat any rooms in their houses except the kitchens. Morning after morning as young Tom Wilson stuck his feet hesitantly out from under the bed covers, he could see the snow that had drifted in through the cracks in his bedroom window. Grabbing his clothes, he would make a break for the kitchen to dress in front of the fire, often forgetting that now with his father away there would be no fire until he built it. Shivering in his shirt tail, he would light the fire and get the kitchen warmed up before his mother and the girls appeared.

Soon after the chores were done and it was getting light, Enoch Payne would come trudging up the road through the snow, and then he and Tom, taking the lunch that Nancy had put up for them, would cross the creek and make their way with difficulty through the snow up the long hill until they came to the woodlot at the top. In the woods the trees protected them from the bitter wind.

One morning, while Tom watched, Enoch cleared the trash around a big maple. Then after an expert glance about him, he spat on his hands and soon had a deep gash in the tree on the side where he wanted it to fall. As the ringing blows of the axe echoed through the cold air, Tom envied Enoch's ability to place every blow of the axe exactly where he wished it.

After cutting the notch as deep as he thought necessary, Enoch called for the crosscut saw and the two of them, kneeling on each side of the tree, started the saw on the opposite side from the notch. Suddenly, as the saw bit in a little beyond the center, the tree began to creak and tremble. With a glance upward to judge the direction of the fall, Enoch yelled "Timber!" and, pulling the saw out, they ran as fast as they could away from the tree, which seemed to hesitate for a moment and then went over with a mighty crash.

Then followed the long tedious task

of trimming off the branches, blocking up the trunk so the saw would not bind or pinch, and sawing it into logs that later could be rolled onto the bobsleigh and hauled out by the oxen to the homestead. It seemed a long time to Tom before Enoch declared that it was time to eat. They built a big bonfire, got their dinner pails, and, placing their sandwiches on long sticks, thawed them out and toasted them a bit over the hot coals.

To Tom that, was the best part of the whole day, for it seemed as if he had never before been so hungry, or food tasted so good.

Enoch, on opening his dinner pail, had carefully laid his big slab of apple pie on a huge chip and set it on the snow away from the fire until he was ready for it. While they were busy toasting their sandwiches, a chickadee, attracted by the sight of the food, began circling over their heads. Enoch yelled at it and the frightened bird departed in haste, but left his calling card, of all places, on poor Enoch's piece of pie.

Angrier than Tom had ever seen him, Enoch jumped up, grabbed a stick and ran off through the woods, shouting and brandishing the stick in a vain effort to take vengeance on the bird. When he returned to the fire, looking somewhat shamefaced, Tom, half scared but bursting with mirth, doubled over in a sudden fit of coughing. Not a word was spoken between them for a while until finally Tom said:

"Enoch, Ma gave me too much pie, more'n I want or need."

Taking his jackknife he divided the

pie and handed the half over to Enoch, who took it with a grin and ate it heartily.

Sitting on a log close to the warm fire, Tom thought how nice it would be to stay there for a while, or else go home. He hated the idea of going back to the hard work. But Enoch said:

"Come on, boy. These winter days are short, you know, and we might as well get something done while we're here."

In the middle of the afternoon Enoch notched an especially big maple, but one which was crooked at the top. When they had sawed in from the side opposite to the notch and through the middle, the tree started to waver and groan. Enoch cast a rather anxious look upward, and said:

"Come on, we'd better get away from here. I'm not too sure where this darn thing is going to fall."

Enoch's fears were realized. Instead of falling in the exact spot he had planned, the maple struck a smaller tree and lodged there.

"Now we're in a mess," said Enoch, disgustedly. "Might have known I couldn't count on that old crooked top."

"What'll we do now?" inquired Tom.

"Cut down the other tree. But you keep away from it, boy. I'll get it down with the axe."

As Enoch chopped, Tom noticed that the big maple trembled violently every time the axe hit the small tree. He called out:

"Watch out, Enoch! It won't take much to pry that big one loose."

But Enoch paid no attention and kept on chopping. Suddenly a limb let loose with a loud crack and the huge tree started to fall. As Tom yelled, Enoch looked up, and then, apparently confused, ran the wrong way. Horrified, Tom saw a limb from the falling tree whip down on Enoch and throw him violently.

Panicstricken, the boy rushed to the fallen tree and crowded in among the branches, yelling:

"Enoch! Enoch! Are you hurt?"

There was no answer. Frantic now, the boy grabbed the limb that lay on Enoch and pulled on it with all his

strength. He found that it lifted fairly easily and, best of all, that it was not resting heavily on Enoch. He was able to get hold of Enoch by the shoulders and to drag him out from the brush to an open space. Laying him flat on his back, Tom leaned over him, vainly calling his name. Dropping on his knees, Tom put his ear to Enoch's chest and found that his heart was beating. His own heart thumping wildly, Tom debated what to do next. Obviously he had no way of getting a heavy man to the house by his own efforts, and if he went for help Enoch might die or freeze.

Rushing over to the fire, Tom stirred up the coals and then half-carried, half-dragged Enoch near enough so that he was within the warmth of the fire. Next he set up a brush and log shelter back of Enoch to reflect the heat. Just as he was starting out on a run for help, he heard Enoch call his name. Hurrying back, he found him sitting up rubbing his head dazedly, but conscious and apparently not badly hurt. After a few moments Enoch said weakly:

"What—what happened, Tom?"

Out of his fright and nervousness Tom spoke harshly:

"You durn fool! I thought you were a woodsman. Instead of runnin' away from the tree, you pretty nearly ran right under it. What got into you?"

"Didn't think it was goin' to fall that way," mumbled Enoch.

"Are you hurt?" Tom inquired, more gently. Enoch moved his arms and legs gingerly, then said:

"Guess not. Seem to have everything all in one piece and workin'. How about goin' home? I've had enough of these woods for one day."

"Can you make it?"

Enoch got slowly to his feet, tottered a bit as he stood up, then braced himself and said:

"Sure I can."

"Well, I'll carry everything if you can get yourself home, but sit down for a minute while I pick up the tools."

After picking up the axe and other tools, Tom returned to the fire and stood grinning down at Enoch:

"It ain't your day, Enoch. First the little bird; then the big tree!"

But Enoch was himself again and said, tartly:

"If you ever tell about that bird, I'll break your neck."

"Won't promise! But I'll see that you get another piece of Ma's pie when we get home if there's any left."

A few days later Enoch, none the worse for his adventure, dropped into the Clinton kitchen to see how Ann and her mother were getting along. The kitchen was cold, and Enoch, getting a non-committal answer to his question about wood, poked his head into the woodshed and found only a few sticks left.

"Got to do something about this wood business," he told Ann.

"I should think you'd had enough of the woods to last you all winter," said Ann, demurely.

But Enoch saw the twinkle in her eyes, and said:

"That darn Tom! Can't keep a thing to himself. I'll fix him! I'll make him help me get some logs out of your woodlot."

Thereafter for several days Enoch and Tom were busy cutting and drawing logs from the Clinton woodlot, but one morning as he rolled a big log forward on the skidway and got ready to start sawing with a crosscut saw, Enoch looked up to find Ann standing beside him.

"Enoch," she said, "Tom isn't here—nor should he be—and how are you going to work a two-man saw with only one man? I can't drive you away from our work here, and I don't know how I'm ever going to pay you, but at least I think I can operate one end of that saw just as good as a man."

# Save Time Seeding Grain

## with a Massey-Harris Grain Drill

Consider the better job of seeding a Massey-Harris Grain Drill gives you . . . add the time and money it saves you, and you'll understand why more and more farmers are using Massey-Harris Drills. They're field-proved!

Positive-acting grain runs, divided for large and small seeds, feed accurately, uniformly. A two-speed "sunflower" drive gear with 8 rows of teeth gives you a wide range of seeding rates. Big telescoping spouts carry grain direct to seed boots, guard against troublesome clogging.

Easy-turning double discs follow the contour of your field to insure a uniform depth of seeding. Constant-height power lift raises drill out of ground quickly . . . assures full clearance . . . gives you light, medium or heavy penetration. Drive runs in oil, starts when furrow openers are lowered . . . stops when they're raised.

Massey-Harris Depth-O-Matic Hydraulic Control available.

Steel grain box prevents costly leaks . . . holds more seed, lets you cover more acres without refilling. Sturdy angle-bar frame supports box and drive unit . . . holds drill in perfect alignment through season after season of hard use.

Massey-Harris makes a model and size drill to fit your needs, too! The "300" Series is available with 6, 7 or 8-inch furrow spacings, ranging from 16 to 28 runs . . . the 20-A combination Grain and Fertilizer Drill (shown above) with 7-inch spacing and 11, 12, 13, 15 or 20 run sizes.

See your Massey-Harris dealer for full details on the complete line of Massey-Harris grain drills, tractors, combines and equipment. For free folders by mail, send coupon below.

## Try These New Vegetable Varieties

By Paul Work

**V**ARIETY requirements for the home garden and for the commercial producer of vegetables differ a good deal, but they overlap a good deal too. Golden Cross sweet corn is good for everybody, and so are Golden Acre cabbage and Stokesdale tomato and Marketer cucumber. Of the two new green bush beans of last year, Topcrop and Contender, both are good for commercial planters; but Topcrop is of high quality but less handsome, and Contender is better looking, more rugged, but not as toothsome for the table—unless taken pretty young. The Surecrop cucumber (All America) is a fine hybrid where resistance to mosaic and downy mildew are needed; but if these diseases are not serious, Marketer is hard to beat. And so it goes.

### What Growers Want

Commercial growers are still interested in varieties of vegetables that yield well, ship well, look good and taste good. Disease resistance is much in demand. But other characteristics have come in. If sweet corn is to be picked by hand, it should pull easily; if by machine, it needs a long shank. Snap bean plants should hold their pods up from the dirt and they should be easily picked. Crops for market should mature at one time to avoid extra pickings of a field. A year or two ago it was almost impossible to get a crew to go over a snap bean field twice, to say nothing of thrice.

### The Home Gardener

The home gardener, on the other hand, looks for dependable performance, but table quality looms high. In general, home gardeners do not want too great concentration of maturity—they'd rather not have 24 plants of Golden Acre cabbage come on in the same week-end. The commercial man can plant half acre patches a week apart and save labor in the harvesting, since he does not have to cut over 2 acres four or six times. Some home gardeners even buy a mixture of varieties of sweet corn for a succession.

Disease resistance is important for the home gardener, too, because some serious enemies cannot be controlled with spray or dust and others require various materials and methods. Even so, I get along pretty well with one duster for DDT for insects and one for fixed copper for fungus diseases.

### New Varieties

Those who liked the old Refugee or Thousand-to-One green snap bean for canning should be pleased with IDA-GREEN of Rogers. The plant is more like that of other varieties, and is mosaic resistant. Pods are longer and darker green than Refugee. TENDERLONG 15 of Associated is similar to Tendergreen but is resistant to two forms of mosaic.

For those who want to cut cabbage over a long period from the same patch, BONANZA of Ferry-Morse is good, as it shows unusual resistance to bursting. It is not much earlier than Glory, but heads are hard when quite small. The plant is large and quality is not up to that of Glory.

NIAGARA is a new slicing cucumber, bred by Henry Munger, resistant to mosaic but, like Surecrop mentioned above, it is hardly up to Marketer in yield. Last year's Yorkstate Pickling is also mosaic resistant.

GRANITE STATE muskmelon (A.A.S.)\* from Yeager of New Hampshire is early, small, oval, thick fleshed

\* A.A.S. means an All America Selection.

and of good quality, fine for northern climates.

ASGROW Y-40 and ASGROW Y-41 of Associated are new hybrid onions similar to Early Yellow Globe. ASGROW Y-42 is of the Sweet Spanish type. Performance of the hybrids has varied with conditions, but they have shown great uniformity.

Home gardeners and roadside marketers will welcome SENECA 60, HIGH QUALITY sweet corn of Robson, which is earlier than Seneca Dawn, with deep kernels and better table quality than most earlies. F. M. CROSS, Ferry-Morse, is about in season with Golden Cross, pulls over a slightly longer season. Ears are somewhat tapering, mostly 16-row, with small cob, deep kernels and well filled. GOLDEN CROWN of Robson is similar to Golden Cross with a higher percentage of No. 1 ears claimed.

We now have good watermelons as early as muskmelons. NEW HAMPSHIRE MIDGET (A.A.S.) is very early and an improvement over White Mountain. Fruits are very small, oblong, with many small seeds. Don't let them become over-ripe. NORTHLAND is a hybrid bred by Harris, early, small, striped, nearly round, with red flesh, and high quality.

### Standbys

Some of last year's introductions should be tried out, such as CONTENDER and TOPCROP beans, both from the United States Department of Agriculture, mentioned above; BURPEEANA pea (Burpee); BURLINGTON pepper (Campbell Soup), for Jersey; GOLD MINE and GOLDEN JEWEL sweet corn bred by Lachman of Massachusetts; IOCHIEF sweet corn; EARLY WONDER tomato. LAKELAND of Woodruff and JEFFERSON of Associated are late for New York but, planted at normal time or a trifle later, are likely to furnish good tomatoes late in the fall.

As always, we do not recommend "plunging" on new varieties. Try them out on a small scale.

Fuller descriptions and some other items are given in Cornell Extension Bulletin 827, which will soon be in the hands of county agents or may be had from the New York State College of Agriculture, Ithaca, New York.

— A. A. —

### SEED TREATMENT

(Continued from Page 11)

germination; it cannot restore life to dead seeds. If the germinability of a given lot of seed is 75% before seed treatment, it is still only 75% after seed treatment. However, low seed germination is nearly always accompanied by a rather high percentage of weak seeds. Very often the protection given these weak seeds by seed treatment will enable them to germinate and produce seedlings, which they could not do without seed treatment.

4. Seed treatment is not a substitute for high quality in seed; neither does it lessen the importance of proper attention to seed bed preparation, adequate seeding rate, soil fertility, lime, and inoculation of legume seeds.

The important question in connection with seed treatment is, what can the farmer expect of it?

He can expect a good seed treatment frequently to increase the number of emerging seedlings and the final stand of healthy seedlings by reducing the large number of seeds which rot in the soil, and by checking the loss from damping-off and seedling blight. He can expect stronger and more vigorous seedlings through the reduction in the percentage of weak seedlings resulting from partially decayed seeds.

A DAWNWOOD FARMS PRODUCT  
MADE IN AMENIA, N. Y.

**You May Save Up to \$27.00 Each Time a Cow Freshens**

CALFBAG — Udder badly swollen, caked, due to calving. Danger of chronic condition. UDDEROLE used for massaging.

3 DAYS LATER—Now bag is often normal. Massaging with UDDEROLE may get cows in production MUCH SOONER.

**Satisfaction Guaranteed or Your Money Back**

Now You Can Help Prevent Udder Trouble Due to Calving. Massaging with UDDEROLE may give powerful 3-way help:

1. RELIEVE CONGESTION
2. HELP REDUCE SWELLING
3. SOOTHE INFLAMMATION

8-oz. tin \$1.00 5-lb. can \$8.00

Buy UDDEROLE at feed stores. Or send \$1 to Dawnwood Farms, Dept. AA, Amenia, N. Y. and receive 8-oz. tin postpaid.

Another fine "made on our farm" product is CAF-STAR, our formula feed for calves. Try it! At most feed dealers now.

**DAWNWOOD FARMS**

**CUT FEED COSTS**

**DOLLYDALE**  
(PAT. POC)  
**SCOOP SCALE**

\$7.50

**AVOIDS LOSSES FROM OVERFEEDING OR UNDERFEEDING**

Shows accurate weight of feed-ration at a glance. Weighs up to 5 pounds of feed. Scale inside handle—Clog proof—Rugged—Automatic—Precision made. Scoop of airplane aluminum. Guaranteed to pay for itself in first month or money back. Postpaid if cash with order.

THE ROBSON COP®. Fred F. French Bldg. N. Y. 17 — DEPT. M-3

**ARE YOU A GOOD "BOSS"**

**I**F your labor turnover has been high in the past, it is time to decide what you have been doing wrong as an employer. It is hard to see yourself as your employees see you, but it should be viewed if the problem is to be faced squarely and honestly. Check these points:

1. Do you really investigate prospective employees? Do you secure information from past employers as to length of service? Has the man shown evidence of enough interest in farming to have secured some training in the field? Have your prospects in the past been working in farming because they want to be in it, or because they have had to do so?
2. How have you handled your help in the past during the "breaking in" period? Do you give clear directions for doing a job and do you really try to teach your new man just how your methods are to be carried out?

The questions listed are merely a few of the many that might be asked of one's self. The next step is that of building a foundation for better relations with employees. Some of the bricks in the foundation should be:

1. Let each worker know how he is getting along and leave little to guess work.
2. Give credit when credit is due.
3. Tell your men in advance whenever possible about changes that will affect them.
4. Make best use of each person's ability.
5. Treat each person as an individual.
6. Put yourself in the other person's place. How would you feel in his boots?

It costs money to be constantly changing help and much improvement will result when some employers reach a conclusion that part of the farm labor problem can be changed by employer improvement.

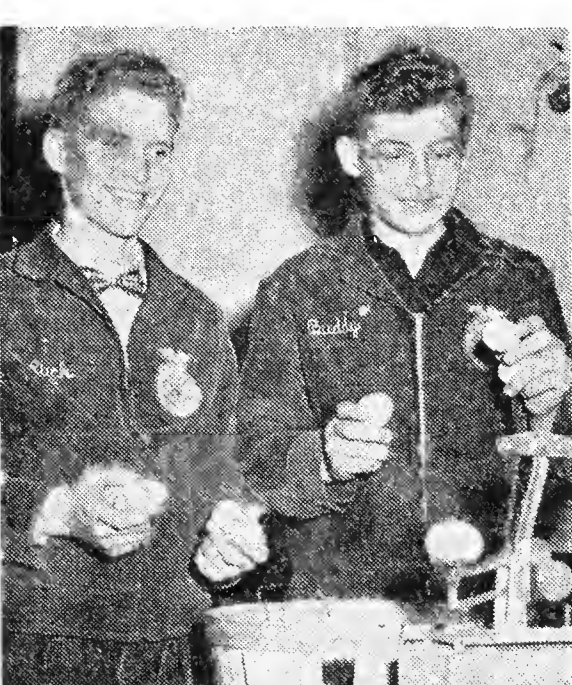

—Robert R. Stockbridge  
—A.A.—

**SAVING COSTLY SEED**

When I am seeding high priced grass seed with the grass seeder attachment on the drill and there is some left in the drill when the field is finished, it usually is hard to get this out by hand. So I take the vacuum cleaner, clean the bag thoroughly, and then suck the seed out with the cleaner. It surely works fine.—I.W.D.

—A.A.—

If you have been longing to visit some of the famous beauty spots of America, now is your chance. AMERICAN AGRICULTURIST is sponsoring a wonderful tour this summer, Aug. 1-26, to Yellowstone Park, Alaska, and Canadian Rockies. Full details in March 17 issue.

Richard Van Skiver of Sussex and Paul Goranson of Glenwood (left to right) made up the winning team in the Vo-Ag egg-grading contest held during New Jersey Farmers' Week. Both boys are from Sussex High School, which captured the trophy this year.

**For their FIRST meal**

**Semi-Solid "E" EMULSION**

**Gives Your Chicks a Head Start!**

**Teaches Chicks to Eat!** Semi-Solid "E" Emulsion actually starts chicks eating, hours and sometimes days, before they're old enough to know they're hungry. While chicks are still too young to eat starting mash without "pasting up", Semi-Solid in scratch grain coaxes their appetites, starts their digestive processes and enables them to bed down under the brooder with full crops. Baby chicks peck beaks-full of nourishing food when their bright eyes spot the glistening surface and color of Semi-Solid.

**Buttermilk—Plus!** Because it is made mainly from nutritious buttermilk, Semi-Solid "E" Emulsion is appetizing, gentle and soothing to the chicks' digestive tract. Buttermilk is easily assimilated for quick energy and fast growth. But Semi-Solid "E" Emulsion is more than buttermilk alone. It provides more vitamins, more carbohydrates, more minerals and protein. Chicks eat more mash and grain, too, when "E" Emulsion whets their appetites.

**See Your Chicks Thrive!** You can see the proof of Semi-Solid's value in the head start it gives your chicks. Semi-Solid "E" Emulsion can help you get as high as 98% brooder-house livability. You'll see your chicks feather rapidly... grow fast. In less than 12 weeks you can have plump broilers to sell or husky pullets ready to go on range. Get Semi-Solid "E" Emulsion from your hatchery or feed store when you buy your chicks. Feed it from their first meal... all the way.

**CONSOLIDATED PRODUCTS COMPANY, DANVILLE, ILLINOIS**  
Division Offices: Princeton, N. J. • Des Moines, Ia. • Sacramento, Calif.  
Makers of Semi-Solid Buttermilk, Semi-Solid Emulsions and Kaff-A

Mix Semi-Solid with scratch grain and sprinkle over the mash in feeders. Give it as a drink, too, for quick moisture intake.

Cut out slits in the handy self-feeding box and watch your chicks peck at that glistening, nourishing Semi-Solid "E" Emulsion.

No matter what else you feed—

**Feed Semi-Solid "E" Emulsion too!**

# DIBBLE'S

## Seed Potatoes

Ample supplies of certified seed potatoes at lower prices will encourage many farmers to change their seed this year. Dibble's Certified Seed is "climate-conditioned" for YOUR farm—hardy, northern-grown, top quality. Free catalog describes, illustrates in color the best varieties.

RUSSETS — SMOOTH RURALS — GREEN MOUNTAINS — IRISH COBBLERS — WARBA — EARLY OHIOS — CHIPPEWAS — KATAHDIN — SEBAGO — HOUMA — ONTARIO — ESSEX KENNEBEC

We also offer the best northern-bred varieties of Alfalfa, Clover, Grass Seeds, Oats, Barley, Corn Peas, etc., at prices that are right.

Send today for free 60th Anniversary Catalog and price list.

**EDWARD F. DIBBLE, SEEDGROWER**  
Box C, Honeoye Falls, N. Y.

Here, taken from Cornell Bulletin 696, are the pieces necessary for the frame of an electric hotbed. Made 6 feet square, it will take 2 standard hotbed sash. A height of 12" in front and 18" in back will give space for the heating cable covered with sand or cinders.

## Growing Plants in an ELECTRIC HOTBED

**G**RANDMA grew some pretty fair tomato plants in her kitchen window. At least they were better than I can grow in mine, because with a modern heating system the air in the house is altogether too dry.

Right now I am at the point of buying a small electric hotbed unit with a thermostat to regulate the heat. To check some of my own ideas and to ask a few questions, I talked with Art Pratt at Cornell, a man who is well known by thousands of 4-H vegetable growers in New York State. First I asked Art how practical it would be to put a piece of insulation board on the ground in a sheltered spot next to the garage, build a frame covered with glass sash on top of it, put in heat cables on top of the board, cover them with sand or cinders, and then set plant-growing flats on top of them. Art okayed the idea, and if my ambition equals my plans I will let you know later how the idea worked out.

The electric unit for a two-sash hotbed is reasonable in price, and Art feels that it is probably your best bet if you want to raise a few plants, either vegetables or flowers, for your own garden.

### Use a Cellar Window

One of the very simplest kinds of plant growing hotbeds is the one which is built just outside of and around a cellar window. The open cellar window provides a considerable amount of heat, although with this kind of a hotbed you won't be able to start your plants until around the middle of March in central New York, or maybe a little later. The sun will be the chief source of heat, so such a cellar window hotbed should be located on the East or South side of the house and in a well protected spot.

If you have a horse manure pile (and they are getting scarcer every year) you can flatten the pile, set a cold frame on top of it, put in 6 inches of dirt and plant your seeds. However, Art Pratt and I agreed that there are some definite handicaps in using any manure-heated hotbed to grow plants for a farm garden. The biggest difficulty is the fact that someone has to be on the job to raise the sash in the forenoon when the sun gets high, and to close it again around 3 p.m., or whenever the weather turns from sunny to cloudy. If you want to try that kind of a hotbed, you'll find it necessary to keep a very close watch on it, otherwise you will either cook or freeze your plants.

When you consider everything, the small electric hotbed with the heat supplied by soil cable and with a thermostat to regulate the heat is your best bet. The thermostat keeps the heat uniform, cuts down on the attention you have to give it, and the experience you will need to run such a hotbed is far less than in the case of a hotbed heated by manure.

### Soil In Flats

After your hotbed is ready there are still a number of steps to take before

the seeds are planted. For example, what about soil? If you didn't save some soil last fall, there should be times during March when it will be warm enough so you can get a few bushels of soil from the garden and put it in the cellar to dry out. If your garden is very fertile and the soil is not too heavy, you will have fair results with this soil without any other treatment than to mix thoroughly a good heaping handful of 5-10-5 fertilizer to each bushel of soil.

It will take very little time, however, to put this soil through a screen to take out the stones and break up the lumps. If the soil is a little heavy, get some fine sand, maybe from some nearby creek bed, and mix in about 50% as much sand as you have soil. If you have any way of getting to a pile of well-rotted manure, you are in even better shape and can mix together 1 part of screened garden soil, 1 part of sand and 1 part of well-rotted manure.

### Build Your Own Frame

Now just a word about the frame which you will need for a small electric hotbed. A frame 6 feet square will take 2 standard 3' x 6' sash. These hotbed sash are better than storm windows, because they cut off less light. However, if you have the storm windows and don't have the sash, you can build the frame so that the storm window sash will fit. The illustration on this page will show details of construction.

If the frame is to be used as a cold frame, a height of 6" in front and 12" in back is sufficient; but for a hotbed where you will need some space for the sand or cinders around the soil heating cable and then some space for the flats which will be put on top of the cinders, we suggest a height of 12" in front and 18" in the back.

Whether you finally decide to grow your plants or buy them, we suggest that this is the year to grow a good garden and a big one. With it, you will eat better and for less money. There is no marketing expense to add to the cost when fresh, tasty vegetables are cooked and on the table an hour after they are harvested!

—H. L. Costline

"It's my tax refund. I had a pretty good year—spent a couple of months in the hospital, had a big dentist's bill, the house burned down..."

## HOW TO REDUCE CROP FAILURES!

Here are two ways to help eliminate the risks in farming: One is to select high quality seed right from the start; the other is to follow proved profitable farming procedures.

To get you off to a more profitable season this year, we have prepared a special booklet that includes up-to-the-minute facts about Ladino, Buffalo and Ranger Alfalfas, Cumberland and Kenland Clovers, Clinton "11" Oats, Birdsfoot Trefoil and other new farm seeds that are growing in popularity.

In addition, this booklet gives valuable tips on fertilizing, stock feeding, weeds, grass silage, pasture and hay formulas, etc.

This year, reduce the chances of crop failures on your farm! Send for the new booklet that tells you how. It's FREE.

## A FORUM FOR Backyard Gardeners

### GARDEN TOOLS

If you have ever known a really enthusiastic fisherman — or maybe a golfer—you may have an idea as to how much money he can spend for equipment. Likewise the backyard gardener who really follows gardening as a hobby is practically unlimited in the equipment he can buy. At the other end of the scale is the gardener who is interested in the money he can save in growing vegetables and who, on a pinch, can get along with a spade, hoe, rake and a small hand duster.

I have had a little experience with a

couple of the more expensive gardening gadgets, one of which is a power hedge clipper. I couldn't possibly justify the investment on the basis of time saved, but I do have, quite a bit of hedge and many shrubs, and if I couldn't buy another clipper I wouldn't part with it. I also have a garden tractor equipped with a lawnmower which is attached to the front end of the tractor. I use the tractor to cultivate when the vegetables are young and, especially, to work unplanted portions of the garden to kill weeds.

If it were only a matter of cultivating the garden for our small family, however, I wouldn't have considered buying a tractor, but I couldn't possibly mow the amount of lawn I have with a hand mower, (or at least I wouldn't); and as long as power is necessary, there are advantages in having the tractor plus a mower, rather than having a small power mower.

— A. A. —

### GROW ROSES

We get much enjoyment from a small plot devoted to hybrid tea roses. Before starting the area, we thought that growing roses was too complicated but we found we were wrong.

Fortunately the bed is on a well-drained site. In preparing the bed we first dug out all the soil to a depth of about 1 foot and put in a layer of well-rotted manure. Then we mixed rotted manure with the soil as we put it back

in the hole. I think we used around a couple of bushels to the bed which is about 50 square feet.

We do a minimum of insect control. We follow the practice of dusting fruit trees and as this dust contains sulphur we throw out a few puffs from the duster as we go past the rose garden on the way to the fruit trees.

It is advisable to protect the roses in the fall by mounding up dirt and peat moss. When we cut the blooms, we leave at least two buds and that is about all there is to it.

Any good nursery stock catalog will show you a number of varieties. From 6 to 10 roses will keep 2 or 3 bud vases full all summer.

— A. A. —

### A STRAWBERRY QUESTION

Can you tell me whether or not the same strawberry plant will produce berries for more than one year? I know that we are always advised to set out one-year-old plants, but it seems to me sometimes that a plant has produced which I was quite sure had grown some berries the year before.

We referred this question to Professor George Slate of the Geneva Experiment Station who says that the same plant will grow strawberries for two years or more. He is not sure how long they will produce but he thinks they might for three or four years if well taken care of. The question, of course, has very little practical value as we are still going to continue to set out a new bed every year.

— A. A. —

### DIVIDING DELPHINIUMS

Can delphiniums be divided? Why do they not last longer in the flower garden?

It is possible to take up and divide delphiniums and thereby multiply the number. However, gardeners generally find that they do not last very long—seldom over 3 years—due to disease (especially crown rot). Therefore many gardeners treat them as a biennial and buy plants or sow seed every year.

If you would like to try sowing seed, put them out in a row in the garden in June. Incidentally, after they bloom try cutting the stems and applying some fertilizer. The chances are you will get an excellent second bloom in late summer.

— A. A. —

### THRIPS ON "GLADS"

A few years ago one of the troubles in growing gladioli was the difficulty of controlling thrips. Now the recommended treatment is to use a 5 per cent DDT dust once a week, starting as soon as the third leaf appears.—*The Backyard Gardener.*

When the New York State Council of Farmer Cooperatives met last fall, Robert Briggs, left, of East Meredith, Delaware Co., N. Y., gave a talk he had prepared on "Self-Help Through Cooperatives." At the meeting he was presented with a \$25 check by A. J. Waldo of Canastota, (right), president of the Council. In the center is Warren Ranney of Ithaca.

Robert is running his own farm and has 12 cows and 500 layers.

"it pays  
to plant

**FUNK  
G  
Hybrids**

#### ★ FASTER STARTING

"Our Funk G Hybrid corn grew faster than any other corn planted. The difference could be seen at a distance—hard to beat."

—J. C. Laughlin

#### ★ BETTER DISEASE RESISTANCE

"Funk G is the best corn I ever raised. It stood up for me when my neighbor's corn had gone down, and when you say unusual blight and corn-borer resistance, it is very true."

—E. G. Figary

#### ★ SUPER-STANDABILITY

"I have a corn crop I don't think can be beat—bar none! And my silo corn stood up after violent windstorms that laid down a few silos in the neighborhood. Funk G corn is all anyone can ask for."

—M. M. Kappler

**say corn growers of New York State  
and other high altitude areas**

Farmers everywhere are talking about Funk G Hybrids.

Why? Because they are finding that Funk G Hybrids, *tested and proved in their locality* give bigger yields of better corn, even when weather conditions are unfavorable.

Corn farmers in New York, northern Pennsylvania and other high altitude areas will be interested in several Funk G varieties developed for rapid vigorous growth and early maturity even in short growing seasons.

Whatever your local soil or climate conditions, there is a Funk G Hybrid especially suited for your silage or husking corn needs. Every Funk G Hybrid is fast-starting, has excellent standability, and high disease, drouth and insect resistance.

Find out which Funk G Hybrid is "made to order" for your area. Send today for your free copy of our new colorful 24-page booklet.

# More About Hatching Eggs FOR BROILERS

By DONALD KUNEY

Seneca Falls, N. Y., Poultryman

IN THE January 20 issue of AMERICAN AGRICULTURIST I read Lee Weaver's comments about producing hatching eggs for broilers. For the past 3 years I have had some experience in this venture and I find that I do not entirely agree with all of Lee's statements. Thinking that you might be interested in my experience, here it is:

The production of hatching eggs is not something "new under the sun." The broiler industry of the Del-Mar-Va Peninsula started in 1923-24. Broiler production showed steady increases until in 1931 7,000,000 broilers were marketed and, in 1949, 127,000,000.

To satisfy the broiler industry demand, baby chicks were first shipped to the area. Now 83% of all chick replacements are hatched in the Del-Mar-Va area.

New England poultrymen have been producing hatching eggs ever since the beginning of the broiler industry until New England has come to be looked on as the number one source of hatching eggs. New England hatching eggs have been and are being shipped to all corners of this country and the world. Seventy-three per cent of all mature birds in the State of New Hampshire were bloodtested last year.

## New York Now In Picture

It has only been during the past few years that New York poultrymen have been introducing hatching eggs for the broiler industry. Up until that time, the industry would not accept the New York Pullorum Blood-testing Program.

To produce hatching eggs for the broiler industry is an altogether different type of production than producing hatching eggs for local New York State hatcheries. A broiler hatchery takes eggs the year around. During the past 10 years, they have taken hatching eggs all but 3 to 5 weeks out of 52. Because the chicks produced are for broilers, eggs can be used that would not be acceptable for pullet flock replacements. From January to June, 23 oz. eggs are shipped for hatching eggs; from June to January, 22 oz. eggs will be acceptable.

The flock owner starts shipping hatching eggs as soon as the egg size reaches the minimum 22 or 23 oz. This means he can sell a lot of medium eggs for the price of large eggs, plus the hatching egg premium. The meat type strains of poultry that the broiler industry requires come into production with early large egg size. Records

show that after a flock of pullets get up in egg size, 90% of all eggs produced go for hatching.

## Premiums

The premium for hatching eggs over the top market quotation varies according to the supply and demand for hatching eggs. During the spring and summer months, the premium is usually the highest. This past year, premiums have been as high as 20 to 35 cents over the top market for large brown eggs.

Because the broiler growers want chicks the year around, hatching egg flock owners can and should start pullet chicks in all seasons of the year. Usually, pullet chicks started in the fall months will produce eggs that will receive the higher premium. However, only poultrymen who have the equipment should attempt fall brooding. Fall brooding requires more space, since the pullet will need to be housed at the age when the spring pullet is on range.

The Del-Mar-Va broiler area is the largest in the U. S. A. In 1949, it produced 26% of the total broiler production of the country, or 45% of the broiler production in the seven concentrated broiler producing areas.

The broiler industry needs hatching eggs and is going to need more because more broilers are being produced each year. I believe New York poultrymen can produce them at a profit.

— A. A. —

## GIRL WINS EGG-GRADING CONTEST

Frances Wooden of Pleasant Valley became the first girl ever to win the New Jersey State 4-H Egg Grading Contest when her score of 98.5 topped a field of ten other 4-H district champions in the event at Farmers' Week. Second place went to Kenneth Wooden, a cousin, of Lambertville, with a score of 97.0. The other contestants, in order of their final scores, were Eleanor Fry of Columbia, Julius Bauermann of Montville, Thomas Gant of Monroeville, Walter Ossowski of Cranbury, Earl Hunt of Titusville, William Lamb of Cross Keys, Ralph Visscher of Clifton, and Howard La Claire of Cross Keys.

— A. A. —

## HIDDEN NAMES

For the past two issues we have revived our "hidden name" contest which we ran a year or so ago. The contest is simple. We merely print *without any relation to advertising or editorial matter* a number of names and addresses of our subscribers. When a subscriber sees his name and address in such a position without reference to advertising or editorial matter, and sends a letter saying, "I saw my name on page — of the — issue of AMERICAN AGRICULTURIST" we will send that subscriber \$1.00.

Unfortunately there has been some misunderstanding by readers who failed to read previous announcements carefully, therefore, we emphasize that the \$1.00 will be sent only to the person who sees his *own name* and address. The letter from the reader whose name and address appears should be in this office within one week of date of issue.

Protect  
YOUR 1951  
POULTRY  
PROFITS

AGAINST LOSSES FROM 4 MAJOR DISEASES

with **SULMET**\*

SODIUM SULFAMETHAZINE

POULTRY DRINKING WATER SOLUTION 12.5%

*Lederle*

The Time-Proved, All-Purpose Sulfa That Saves  
Millions of Birds Annually from Death and Stunting

Low-in-cost

Swift-in-action

Easy-to-use

- Each bird gets proper dosage, for sick birds will drink water that contains SULMET SOLUTION 12.5% even though off feed.
- Quick control is obtained over outbreaks of cecal and intestinal coccidiosis—treated birds become immune.
- Losses in outbreaks of pullorum disease in baby chicks are quickly checked and reduced.
- Losses from acute fowl cholera in chickens, turkeys and ducks are checked and reduced.
- Coccidiosis in turkeys is controlled with slight loss.
- Rapid control is obtained over outbreaks of coryza (cold) in chickens. Prompt use of SULMET SOLUTION 12.5% will help restore normal laying levels.

Read carefully the circular enclosed in the package for *best results* in the use of this product. Prompt treatment after accurate diagnosis is a key to best results. It is advisable to obtain a *laboratory* diagnosis, *especially in intestinal coccidiosis, coryza, pullorum disease and fowl cholera*. Do not hatch eggs laid by hens during medication with sulfas, or for five days thereafter.

If you cannot get SULMET Sulfamethazine *Lederle*, please write us.

We will gladly send upon request a new edition of "Control of Poultry Diseases."

\*Reg. U. S. Pat. Off.

## DOWN THE

By J. F. "Doc" ROBERTS

**I**T LOOKS now as if we were going to go through the same old political shenanigans with prices, controls and rationing all over again: "Freezes" that thaw out and run in every direction, abusive propaganda (most of it not true)—until food and the farmer find themselves "butchered."

For some reason or other I find most farmers more complacent than formerly. It is hard to say whether this is due to experience with controls that they know will not work, or whether they realize that prices cannot break as long as the government comes out with a spending budget of over 70 billion dollars. Of course they are again right, for until or when the government stops pouring out billions where necessary, and also where unnecessary, there is no other answer but inflation.

### It Happened Here

Our livestock prices have all advanced since the "freezes." The way this ruling was set up, this could not happen, but it has. Just another example of the lack of realistic thinking among mayors and other politicians in taking over businesses they know nothing about.

There is some talk now that surely there is a price over which the public cannot go. This is especially true when the new taxes begin to take over 30% of all income. The thinking seems to be that if prices of food and other things are allowed to go up to this point, then prices cannot get any higher and black marketing will be impossible. In other words, let supply and demand set the price at the highest possible level, and then the bureaucrats can use that price for their rulings and be absolutely safe. Apparently that should work, but supply and demand prices are flexible and change very rapidly under any and every changing condition. So again, while that looks sensible and sure-fire for political controls, it won't work either.

"Production" is going to be the important farm word as long as government is going to spend over 70 billion dollars a year—and they are going to spend it if they can get it. Better production is really the only farm answer to increased costs, whether it is look-

ed upon as a selfish personal reason or as a national or international patriotic reason.

### Livestock and Safety

During the first World War the great slogan was: "Two blades of grass where one grew before." After that war, this proved disastrous to thousands of farmers. History does have a way of repeating itself, just as it is doing right now with prices. While better production, and even greater production, is going to be a farm necessity, there are ways and means of doing it without our expanding and without getting too far out on a limb. Buying young livestock that will grow into production or gain in weight, instead of purchasing highly-mature and high-producing livestock or growing up your own young animals, is one way of protecting yourself. Maintaining strict rotations of our lands is another way—not to find them all plowed up and nothing coming on at the end of this period. The possibility of a poor growing or poor crop year should not be forgotten. There is a limit to how far or how deep any of us should get into this greater production.

How far we can go with animal and meat expansion is a question no one can answer for us. Yet we are reading every day about the great opportunities for its expansion. If we had never seen the time when there was more than enough meat to go around, this talk would carry more weight.

In all truth the Northeast is in the best position to expand livestock production of any other section. This is true because we are way under-expanded at the present time, and with the increased costs of marketing, transportation and changes in population, the Northeast should get back to its early position as a livestock center.

We are hearing a great deal about the South with its year-round grazing, etc.; yet this week, during an unusual cold spell, we hear of thousands of livestock dying of exposure. If you have ever seen livestock in the South in a dry, hot summer, you would still feel that even with our cold winters our livestock never goes through such a setback or such a tough period. These new sections we are hearing so much about are not new—this country was discovered a long time ago.

Give me the good old Northeast for stability of growing conditions, water, livestock production and the security it offers in year-in and year-out farming, along with the same sort of conservative but stable thinking of my neighbors.

—A.A.—

### DUTCHESS MEN BUY \$30,000 ANGUS BULL

Homeplace Eileenmere 999-35th, reserve champion bull at the International Livestock Exposition, was bought at the exposition in Chicago by three Dutchess County Aberdeen Angus breeders for \$30,000.

The purchasers will use the bull jointly at all times in their herds but the bull will be housed for a year on each farm. According to Lee Leachman and Allan Ryan of Ankony Farm, Myron and Agnes Fuerst of Fuerst Stock Farm, and Ted Ryan of Mole's Hill Farm, this sire will be at Ankony Farm, Rhinebeck, N. Y., in 1951; at Fuerst Stock Farm, Pine Plains, N. Y., in 1952; and at Mole's Hill Farm at Millerton, N. Y. and Sharon, Conn., in 1953.

This son of Eileenmere 999th, and grandson of Eileenmere 487th, chief herd sire in the Penny and James herd at Hamilton, Missouri, was bought from Penny and James after winning many 1950 awards. He was reserve grand champion at the All American Futurity, the American Royal, the National Angus Show, and the International.

He was grand champion at the Missouri State Fair and several other shows.

### HOW I RID MY HOUSE PLANTS OF LICE AND BUGS

**F**ACED with the fact that I was about to lose many of my cherished house plants, I wondered if some home cure could be found that would bring desired results, for didn't our grandmothers use home remedies for many things? They didn't run off to the store every time they had a problem to meet, such as this.

After discovering that my lovely multi-colored coleus, gardenias, and free blooming begonias were losing their leaves and color, I tried a mild Ivory soap spray at intervals, but to no use. Within a few days the plants were again infected with as many—and it seemed like more—bugs. Sprays were bought at the suggestion of many other plant lovers, but it all sifted down to useless work and a waste of money.

I then decided to try a home remedy and the thought of Lifebuoy soap came to my attention. By this time my plants were a sorry looking sight as they had lost all urge to bloom and most of the leaves had turned yellow and fallen off. At the least jar of the table or plant, a few leaves would drop to the floor.

My first move was to obtain the bar of Lifebuoy. This and a small pan of lukewarm water were placed on several thicknesses of newspapers on the kitchen table. Each plant was brought to the table and I then wet the ball of the forefinger and thumb in the water, rubbed them over the cake of soap and rubbed the fingers over the top and back of the leaves in one operation. This first application was done very carefully, running the soapy fingers down the length of each stem.

Don't raise your arms in protest because of the work. It's not such a long process; any house plant lover would call it fun. Within the space of twenty-four hours my plants had taken on a new lease on life. After ten days I again repeated the soap bath—not that lice were again present, but as a precautionary measure.

Now after two months my plants are

free of ANY KIND OF BUGS OR LICE and are as healthy and green looking as any plant. The free blooming ones are a mass of flowers.

—Alice Gammell, Colrain, Mass.  
— A. A. —

### TREES TO PLANT

**F**ROM the looks of things the elm is on the way out but the maple, either Norway or "Rock or Sugar" are the best of the dense shade-type tree, and as they are insect and disease resistant, they should be planted.

The Silver maple which has often been planted in the past in quite large numbers around homes, grows fast but it doesn't stand up well in storms, so for this reason the planting of this tree should be avoided.

The weeping willow is okay to plant but the very dense shade it gives will kill all grass under it.

The black walnut makes a nice tree to plant at the corners of a lawn, as the shade from it isn't as dense as most other trees, and the grass will grow under it as well as in the open. It also is a fast growing tree once it gets established, but the nut hulls and leaf ribs make some raking necessary.

The English and Japanese walnuts make a much more dense crown than the black walnut.

—Paul Baron, Andover, Conn.  
— A. A. —

### USING SPREADER IN ZERO WEATHER

**I**N John Babcock's column he mentioned the silly feeling accompanying the unloading of a manure spreader by hand. 'Tis even worse in a 45 m.p.h. wind at a temperature well below zero.

I had this problem myself many times, till I began leaving a 5-gallon can of old crankcase drainings by my spreader. After each daily spreading all chains and crossbars in the bed of the spreader got some oil poured over them. My spreader is out in all kinds of weather at the end of the ramp. This oil method has worked well in our coldest temperature of 10 below and after a night ice storm. All chains and drags were free. — Floyd Lampkin, Thurmont, Md.

Extension Service workers of New York State joined with the railroads recently to honor John Hall Barron, first county agricultural agent. The railroads serving New York State presented a silver plaque to Mr. L. R. Simons, director of extension, noting that Mr. Barron started serving New York Farmers on March 1, 1911. His salary was paid by the D. L. & W. Railroad and the Binghamton Chamber of Commerce.

Left to right: Edward J. Leenhouts, Rochester, New York Central Manager of Stockyards and Agricultural Development; L. R. Simons, Director of New York State Extension Service, Ithaca; Hawley Rogers, agricultural agent for the Erie Railroad in Buffalo; O. B. Price, Rochester, New York Central General Agricultural and Livestock Agent.

Hundreds of Maryland farms have added new barns like that at left, to meet Washington inspection requirements.

## Strict Regulations On Maryland Dairy Farms

By JIM HALL

ON a recent trip in the Old Line State, I found that the chief difference between Maryland and some of our other Northeast states was that they had about a month longer fall grazing and far more rigid milk regulations.

The milk regulations are so iron clad in Maryland that after a few hours in the state anyone with eyes can tell, just by driving past a farm, whether that farm's milk is shipped to Washington, Baltimore or Philadelphia!

Washington perhaps has the toughest requirements. Milk authorities in the nation's capital won't accept milk from a farm where there is a straw stack in the barnyard; they require windows on both sides of the barn; they insist on a paved barnyard when it is adjacent to the barn, and they require that cows face out in the stanchions. The light and space requirements per animal are such that the familiar old bank barns so common to Maryland and Southern Pennsylvania could not be converted to meet all the specifications.

The result is that in Maryland you'll see farm after farm with a building lay-out like that shown at the top of this page. There'll be a good old bank barn with the over-hang so popular in that area, plus a modern concrete block, steel-roofed barn nearby. So many of these new barns were put up to meet Washington requirements that everyone calls them "Washington type" barns. Some of the men put concrete barnyards alongside the new barn, but most of them, like Hanson E. Crum of New Midway, who rents the farm and buildings shown in the above picture, build a fence runway from the new to the old barns so that the animals can use the old barnyards and have the benefit of the old stone windbreaks—a real benefit, by the way, because the old West wind constantly hurries across Maryland to get to the sea.

### Added to Herd

Now these milk regulations didn't all go into effect at once, but as one was added to another and farmers realized that they'd need a new barn, most of them decided that while they were building they might just as well add a few head to their herd to help pay for the new barn. Men who had 10, 12, or 14 milkers apparently all decided that 30 would be a nice round number and built to accommodate that many. You'll find hundreds of these barns, all with 15 stanchions on a side, with all the cows facing out, and doors at both ends to let the manure spreader be pulled through. The barns are all high and so light from the many windows that it's almost like being outdoors. As a matter of fact, these barns are so doggone clean that they reminded me of a modern milking parlor—it was hard to realize that cows were living right in the barn day and night.

While the barn requirements are strict enough, they are nothing to what Washington requires in the way of a milk house—or dairy, as they call it

in Maryland. This dairy must be at least 10 feet from the barn and must consist of three rooms—one for the boiler because all utensils must be steam cleaned, one for the washroom, and one for the cooler. This 'dairy' may be connected to the barn by a roof but there can not be any walls connecting the dairy to the barn. For the Baltimore market, there may be a wall on one side of the passageway from the barn to dairy, but one side must be open. For the Pennsylvania market, this 'open air' passageway is not required, and that's how from the road you can tell where a man ships his milk!

The Baltimore requirements are a little easier than Washington's in a couple of other respects, too. The 'dairy' may be as close to the barn as six feet—provided the dairy room door can open outward—and they don't have to have a boiler room. For Baltimore the dairyman may use the old barn, provided he arranges it so that the cattle face out and so there are two square feet of window space for each cow. Both cities require that the inside of the barn be of concrete for at least 18 inches up from the floor and that the inside be plastered.

### Try Grass Silage

Dairy crops in Maryland are much the same as in the rest of the Northeast, although ladino and birdsfoot trefoil aren't so common; and grass silage seems to be just getting a good foothold. Alva Young of Detour has put up rye silage, and Dick Richardson has put up grass silage for years on his fine big farm between Toneytown and Frizzleburg; but the biggest grass silage operation I have ever seen anywhere is at Francis Herring's farm near Westminster. He has 10 silos and 7 of these are filled each spring with first cutting from fields that were seeded with 20 lbs. of alfalfa and 3 lbs. of timothy to the acre.

Francis has 800 acres and has been putting up grass silage since 1932 for his feeder beef cattle. Each year, between August 30 and November 15, he buys 560 feeder cattle at the Union Stockyards in Baltimore, feeds them 3,000 tons of grass and corn silage plus good hay from 150 acres and his own mixture of corn, cotton seed meal, etc., and sells them at the same stockyards, starting in February. To help keep his fields under control, he buys 80 calves each spring to market in the fall when pastures are done. A purebred commercial herd of 350 to 500 Hampshire pigs also helps convert his 250 acres of corn into meat for the Baltimore market.

Francis discovered something that other Northeast beef raisers have wanted to know: When he puts up alfalfa silage without wilting, he is troubled with yellow fat in his beef animals, but when it is wilted, the fat is white. He also found out that he can change the fat from yellow to white in about 5 days by substituting linseed oil meal and barley for the cotton seed oil meal in his grain ration!

# FRESHENING TIME

is DANGER MONTH!

Of all the year's cycle, for the dairy cow, the few weeks before and after calving are the weeks of worry . . . and the weeks that can make or break the entire lactation period to follow. Many cows lack the physical vigor to come through freshening safely without a medicinal build-up.

It's a fact that the Drugs, Iron, Iodine, Cobalt, Calcium, Phosphorus and Vitamin D, contained in concentrated, low-cost Kow-Kare, are scientifically designed to promote safe and natural functioning of just those digestive and reproductive organs where the strains threaten most.

THE TWO @-A-DAY

Build-Up

Use Kow-Kare, too, for any cow with sluggish appetite or unexplained low milk yield. Your farm-supply store can supply Kow-Kare in 3 sizes, including the new economy 50 lb. Drum. Send for FREE BOOK, "Care and Feeding of Dairy Cattle".

## d-con will help you WIN the WAR ON RATS

**GUARANTEED TO CLEAR YOUR PLACE OF RATS AND MICE COMPLETELY OR YOUR MONEY BACK . . . . .**

Now, with amazing ease, you can clear your place of these disease carrying, property destroying rodents—and keep it clear, thanks to D-CON and its wonder working active ingredient WARFARIN. This scientifically developed product, discovered by the University of Wisconsin, is recommended by Federal Departments, county agents and the Farm Press of America. Its miracle, result producing action has been proven again and again in hundreds of supervised and controlled tests.

### SAFE, CLEAN, EASY TO HANDLE

D-CON is new, different. It outsmarts the rats because only cumulative doses prove deadly. Tests prove that rats return for successive daily feedings—they do not detect the source to avoid it—and a few days of feeding spell their doom.

### ENOUGH TO CLEAR YOUR PLACE OF RATS

Enough D-CON to clear the average farm of its entire rat population will be sent you in a plain wrapper with an ironclad money-back guarantee, for only **\$2.98**

**RUSH YOUR ORDER TODAY  
UNITED ENTERPRISES**

531 W. WEBSTER AVE. • CHICAGO 14, ILLINOIS

### RESULTS ARE GUARANTEED

Rats are smart—they have survived all efforts to destroy them. Now with miracle working D-CON, their days are numbered. D-CON will clear your place of rats in 15 days—or it won't cost you a penny. By following the simple feeding instructions, your troubles with rats and mice are over—now and forever.

### HANDY MAIL ORDER COUPON

## Happy Is The Day When Backache Goes Away . . . .

As we get older, stress and strain, over-exertion, excessive smoking or exposure to cold sometimes slows down kidney function. This may lead many folks to complain of nagging backache, loss of pep and energy, headaches and dizziness. Getting up nights or frequent passages may result from minor bladder irritations due to cold, dampness or dietary indiscretions.

If your discomforts are due to these causes, don't wait, try Doan's Pills, a mild diuretic. Used successfully by millions for over 50 years. While these symptoms may often otherwise occur, it's amazing how many times Doan's give happy relief—help the 15 miles of kidney tubes and filters flush out waste. Get Doan's Pills today!

# Style Leaders

2087

2281

2389

2088

**No. 2087.** Ensembles are bigger than ever in dress and bolero combinations! This cap sleeve charmer with scalloped yoke has a jacket that buttons below a trim collar. Sizes 10-20. Size 16, 6 1/4 yds. 35-in.

**No. 2281.** One of the nicest features of this cotton is shoulder buttoning—it means you can make it in a jiffy, iron it just as easily! Sizes 12-20, 36-40. Size 16, 3 3/4 yds. 35-in., 3 1/4 yds. ric rac.

**No. 2389.** This convertible collar shirt-waist is especially easy to wear—tucked shoulders give a soft blouse to the bodice. Short or three-quarter

length sleeves. Sizes 12-20, 36-44. Size 18, 4 yds. 39-in.

**No. 2088.** Two new details are noteworthy in this dirndl! The bodice has simulated button-yoke lines and the skirt has two heart-shaped pockets. Sizes 2-10. Size 4, 2 yds. 35-in., with 2 yds. ric rac.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 20 cents for each pattern wanted. Add 20 cents for our new Spring-Summer Fashion Book which has stunning pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

## Please Tell Me...

By Kathleen Berresford, Nutritionist

My baby is a year old and still wants his bottle. My neighbors think he is too old for this and that I should take it away from him. What do you advise?

Every baby has his own particular needs. Some babies are ready to drink from a cup at 7 months. Others stay on the bottle until they are two or even three years old. Your baby will give up the bottle when he is ready to. In the meantime, you might offer his orange juice and a little of his milk in a small cup so that he can let you know when he wants more from the cup. It will probably take longer for him to give up the last bottle at night than the daytime bottles.

**Do my children still need cod liver oil? They are 3 and 5 years old.**  
Children need some form of vitamin

D as long as they are growing, in order to make good bone formation and prevent severe rickets. Scientific studies have proved that they need it through adolescence. Cod liver oil is one of the cheapest ways to supply it. Many doctors advise giving it the year round, with a smaller dose in the summer. If you stop giving it in the summer, the children may lose their liking for it, and it is easy to forget to start it again in the fall.

— A. A. —

## MAKE EACH CHILD A BOX

ALL children love to color, paint, and cut out pictures. They can spend hours at this pastime; but where there are several children in the family, quarrels and mix-up of equipment are likely to occur if each one isn't given a special container to keep his equipment in. I solved this problem at our house by painting empty cigar boxes different colors. Each child was given his own box. Now there isn't any argument about whose pencil or scissors are being used, for each child learns early to keep and use his own tools.—B.C.

At last! No-Rinse washes that are clean and bright!

**WE CHALLENGE EVERY WOMAN  
TO TRY NO-RINSE WASHING NOW!**

PROCTER & GAMBLE'S NEW PATENTED

# More Flowers FOR LESS WORK

BY GRACE WATKINS HUCKETT

◀ A discarded Easter plant became this thing of beauty in a Maine garden 6 months after the Easter season. After danger of frosts had passed, bulb was set outdoors in good rich loam and kept watered all summer.

—Photo by Harry A. Packard

busy person. There are, however, so many other lovely flowers I wish I had space and time to care for that I have to be firm with myself when it comes to planning.

If I had spots where fairly big plants could grow, protected from wind, and get the necessary sunshine, I would sow seeds of the pink-flowering spider plant (cleome) or one of the fancier sunflowers; they now come in chrysanthemum-flowering forms or even in reddish colors. Another one to plant in spots that do not have to be disturbed is the annual larkspur. It reseeds and in that way gets off to an early start. New seed would have to be sown every two or three years and the ground kept fertile.

## 1951 Flower Winners

The 1951 Silver Medal Winner of the ALL-AMERICA SELECTIONS is the so-called Mexican sunflower, Tithonia Torch. It bears single dahlia-like flowers fiery orange-red in color, fine for cutting. It blooms in July or August, makes bushy plants about 4 feet

Marigold Glitters has large fluffy chrysanthemum-like canary-yellow flowers, 3 inches in diameter. Winner of All-America Bronze Medal.

—Photo by Burpee

**T**HE most flowers for the least work" has to be the motto for very busy people. In such cases, the easiest way to get flowers is to grow annuals in rows in the vegetable garden and let machinery do part of the work. This would give ample flowers for bowls and vases in the house, besides adding a beauty spot to an otherwise purely utilitarian part of the property.

I know some farm families who plant such perennials as peonies and chrysanthemums along the outside rows of their vegetable gardens; this makes both cultivation and needed supports during blossoming easier to manage—besides giving passersby a pleasing eyeful.

Another angle to this planting of flowers in the vegetable garden is that in times of abundance certain flowers that hold up well could be sold at roadside stands. Pussy-willows, the spring bulbs, lilacs and peonies belong in the

permanent plantings and are eagerly sought for by city-folk starved for a bit of nature. Larkspur, sweet peas, gladioli, summer phlox, marigolds and zinnias come in beautiful colors and last well as cut flowers. Also they grow well in ordinary garden soil.

Where flowers are planted in borders for landscape effects, that means a certain amount of transplanting except for the perennials which form the backbone of the planting. The annuals in that case are used for filler after early-flowering perennials have put on their show, so need to be started early in flats or pots and to be almost to the blooming stage when finally transplanted into the border.

For such purposes I have come to rely chiefly on petunias, marigolds and zinnias. There is sufficient variety in these three groups, as to height, color and type of bloom, whether ruffly, twisted-petaled or just usual, to meet almost any demands in the garden of a

Sweet Peas along the garden fence are a source of delight. This new giant, Fragrance, is an appealing shade of cream which is nice alone or with other colors.

—Photo by Burpee

Tithonia Torch or Mexican sunflower, developed by Bodger Seeds, Ltd., El Monte, Calif., is a streamlined form of the original Tithonia. Winner of All-America Silver Medal.

## More Flowers For Less Work

an entire garden with marigolds in these different varieties, as was demonstrated at the big New York and Philadelphia flower shows last year. To prolong the season of bloom, the home gardener can start some of the seeds indoors, then when the ground warms up, start other seeds outside.

The Jap beetle is the first real pest on marigolds that I have experienced. And the rascals are very selective, I notice! They choose certain varieties and only when they are demolished do the beetles move on to another. I have learned to go to these favorites of theirs first when on a killing expedition.

Petunias have advanced tremendously in late years, especially as to color. Last year's introduction, the really red dwarf Fire Chief, gave a fine account of itself in my garden. Flaming Velvet is a darker red and is taller, being a bedding type. Rose of Heaven belongs in this group and is a good clear pink. The balcony petunias are more spreading; old favorites are Blue Wonder and White Wonder. It is best to start petunias early indoors; then they are ready to flower when needed in July and August. Mine always continue until frost.

For very fine effects in the garden and as cut flowers, the ruffled giant

petunias excel, of course. If you have not grown the common varieties, I suggest that you do not start with this fancy stock. It's more expensive and requires special know-how.

Zinnias have come up in the world. I remember the stiff round flowers and unattractive colors of the earlier models, their chief virtue being that they withstood hot weather. The hybridists have been busy, and now we have zinnias from dwarf to giant, pastel or vivid in color, petals twisted and tubular, strap-shaped, fluffy and ruffled, or flat. The baby pompom, lilliput or cupid zinnias are good for edgings and for small arrangements. The taller ones can be fitted into vacant spots where bulbs, poppies or other early flowering perennials have died off. The flower arrangers can do wonders with the newer zinnias!

Another useful annual for an edging where small bulbs show earlier in the spring is sweet alyssum. Little Gem or Carpet of Snow does not straggle as does Maritimum. All reseed freely; once started they keep coming up every year. Thinning may be in order in some spots, and filling out in others. If one wants to take the trouble to shear the plants from time to time, a neat straight-edged effect may be obtained.

## NO DRUMS

(Continued from Page 15)

He rather surprised her by agreeing. "I'll admit that one man can't do much with a two-man saw," he commented. "And I'm not sure that a two-man saw can be operated by one man and one woman, but let's see how it works."

For hour after hour, Ann pulled and shoved on her end of the saw until finally Enoch called a halt.

"You did all right at first," he told her, "but now you're tired, and you're not only dragging your feet but taking a free ride, too. We've sawed enough to keep me busy splitting it for quite a while. You go home and rest."

At last a sizeable pile of wood was sawed and split, enough to last Ann and her mother for the kitchen for some time, and that certainly was a comfort.

Henry Bain had now become a regular caller at the Clinton home, where Mrs. Clinton always made him welcome. Even Ann grew accustomed to his visits and began to respond to his friendliness, his apparent interest in their farm problems, and his friendly advice. But always in the back of her mind was suspicion of his motives and the belief that his interest was based upon the hope that some day he would own the farm. It never occurred to Ann that he might have a personal interest in her. But so very friendly was Mrs. Clinton that one evening when he was alone with her, Henry hinted that he had always been interested in Ann and was unhappy when she married Mark Wilson.

Noting the sympathetic look on Mrs. Clinton's face, he made bold to go a step farther and pointed out how much more he could have done for both Ann and her mother if Ann had married him.

After that talk, his visits became even more frequent, and Mrs. Clinton outdid herself in trying to make him welcome. One evening when he was there, she abruptly excused herself, saying that she had a headache, and went off to bed. Ann glanced at her retreating form suspiciously, for she knew that her mother did not have headaches frequently, and she had said nothing about it earlier in the

evening. But Ann made a polite effort to carry on the conversation with Henry, hoping all the time that he would go. Instead, he continued to talk about the farm and the crops, and then said:

"For a girl, you certainly did a good job with the crops on this place this year, Ann. But of course, there are a lot of things that you can't do, and raising crops isn't all there is to it. Farmers have to have some cash."

Thinking that he was hinting about the unpaid interest on the mortgage, Ann flushed and said, defensively:

"Well, Henry, don't you think these are unusual times? Even good farmers aren't making much money now, with all the help gone to war."

To this her visitor made no direct reply. He sat silently for some moments, opening and shutting the blade of his jackknife, and then suddenly burst forth:

"Ann, you don't know how much I've wanted you, how heartbroken I was when you married Wilson!"

"Hush!" she exclaimed, startled.

"No, I won't hush. I've got to tell you," he persisted. "If you'd just given me a chance, you wouldn't have to do all of this hard work. I'd have taken care of you."

Embarrassed and uneasy, Ann got up out of her chair.

"You shouldn't talk to me like this, Henry," she said quietly. "I'm sorry if I have hurt you, but I was in love with Mark when I married him, and I'm more in love with him now than ever."

She stopped, then added:

"And I'm sure he loves me."

Henry closed his knife with a snap and put it back in his pocket.

"Well," he said, shortly, "I hope you don't ever regret your marriage to him."

To Ann the remark sounded like a threat. She turned to face him.

"I won't regret it," she stated, positively.

An awkward silence followed her words and then Henry said, rather lamely:

"Well, I guess it's time to go."

Ann made no reply as he put on his overcoat and hat and went out the door, banging it behind him.

## AT HAYFIELDS

By TOM MILLIMAN

### BRIGHAM FARMS

**U**SUALLY the title is Brigham Jerseys. Some of the articles on this famous herd were entitled, "World's Record Herd Average" or "How the Jerseys at Brigham Farms accomplished . . . ." After seeing them, I can only write of the Brigham Jerseys the title "Brigham Farms" for the reason that land and farming come ahead of the cows in the planned action of owner Elbert S. Brigham. A visit was made to Brigham Farms at St. Albans, Vermont, on November 9, 1950, for the reason that the articles and personal reports from visitors didn't jibe with my thinking by about 100 lbs. of fat per cow.

How could a herd of 104 Jerseys on twice-a-day milking hang up in 1949 an average production of 11,703 lbs. milk, 616 lbs. fat, per cow, 2-yr. old heifers included? Taking into account 45 years of ownership, 23 years with the same herdsman, and evaluating the effect of a long succession of sons of the best Jersey bulls, still there was left a 100 lbs. gap in my reasoning.

After many delays, J. Leon Atwood of Plattsburg, N. Y., and I made the trip to St. Albans. Mr. Atwood was in 1949 the leading Ayrshire herd owner in U.S.A. with actual production of 534 lbs. fat for 25 cows milked twice-a-day during the calendar year.

Our visit was highly exhilarating for a good many reasons and most of all because we found farmer conditions throughout. There was nothing fancy. As the herd expanded Mr. Brigham merely enlarged his main barn by extending it out in one, two, and finally in three directions at modest cost. The central part of the farm has been in the Brigham family since 1804 and has been gradually expanded by the present owner until it embraces 640 acres.

*Immediately upon meeting Mr. Brigham the key to the remarkable performance became apparent. He first spoke not of cows but of soil, lime, fertilizer, rotation, permanent pasture reclamation, rotation pastures, grass silage, corn silage, alfalfa, and good mixed hay. It is upon these things as well as upon the herd of Jerseys that he has provided guidance in 45 years of ownership.*

The goal at Brigham Farms is to provide every animal on the place with all the high quality roughage she can eat 365 days in the year.

Much attention is given to pastures. We saw some of the most modern pasture mixtures for rotational grazing. Then, too, we saw high yielding permanent pastures on rough, sloping, stony land. These are fertilized annually, one year with manure and the next with 5-10-10 fertilizer at the rate of 500 lbs. to the acre. When the legumes in a rotated pasture or hayfield begin to fade, that field is manured, fertilized with 400 lbs. to the acre of 8-16-16 and planted to corn. Lime of course is used as needed to bring the soil to a nearly neutral condition.

### Big Cows

The Brigham herd is made up of purebred Jerseys of the largest size we ever saw. In the opinion of Mr. Atwood and myself, the extra size came not so

much from breeding as from the land itself.

The feeding schedule for milking cows is interesting. In 24 hours, 5 feedings of three kinds of roughage are provided all milking animals. Grain is fed three times — morning, noon, and night. The morning roughage consists of a limited amount of corn silage plus hay. At noon, corn silage is again fed in limited amount with the grain ra-

LEFT TO RIGHT: Cesaire Lacoste, herdsman; Elbert S. Brigham, owner, Brigham Farms, St. Albans, Vt.; J. Leon Atwood, noted Ayrshire breeder, Plattsburg, N. Y.; and T. E. Milliman. Cesaire is in town clothes because he had just returned from having his injured right hand dressed by the doctor.

The cow shown is 3-year-old Volunteer Confidant Daria, 4 days after 2nd calving. She started her 1st lactation at 2 yrs., 5 mos. and on twice-a-day milking produced in 305 days, 11,554 lbs. milk, 626 lbs. butterfat. This is actual production, rather than mature equivalent. Note the large size of this 3-year-old Jersey. We saw no small Jerseys at Brigham Farms.

tion. At night a very large feeding of grass silage is given and this amounts to as much as the two earlier feedings of corn silage or more. Hay is fed again at night, of course.

In the matter of grain, one would expect heavy milking cows testing 5.3 butterfat to be fed to the limit. Such is not the case at Brigham Farms. No cow ever receives more than 16 lbs. of grain regardless of her production. The feeding ratio for the whole herd in 1949 was 1 lb. of grain to 3½ lbs. of milk.

The 1949 national record of 616 lbs. fat topped any large herd of any breed regardless of the number of times milked daily. Herdsman Cesaire Lacoste, on the job for 23 years, and his father-in-law, Mgr. E. A. Dupre, have had much to do with the development of the farm and herd under Mr. Brigham's direction. Only practical things have been undertaken. We saw nothing beyond the reach of any dairyman operating his own land and milking his own cows. The 1949 record was not a freak since the one made in 1948 reached 588 lbs. on 105 cows. As far back as 1941 the average was 512 lbs. on more than 100 cows.

As Mr. Atwood and I left Messrs. Brigham and Lacoste and headed back to New York State over the Lake Champlain bridge, we concluded that the Brigham formula is workable by any dairyman. Such a high production

goal can be reached by determined dairymen staying at it long enough. To us the formula seemed to be:

1. Good land treatment ahead of anything else; lime where needed, fertilizer, rotation, improved pastures, grass silage, corn silage, good mixed hay (much of it second cutting); alfalfa in mixtures and wherever this choosy legume can be grown alone. To these can now be added birdsfoot trefoil.
2. Sufficient mineral feeding of the soil to insure large growth of animals and cause them to yield well from rich forage.
3. High intake of good roughage—spring, summer, fall, and winter—365 days a year for each animal on the place.
4. Uninterrupted ownership and skill of helpers applied to all the factors in dairying.

I think it will be conceded that any enterprising farmer can gradually achieve the roughage program prevailing at Brigham Farms. Now that arti-

beef out of dairy cows? What cows?

1. The smaller virgin heifers. They have an easier time giving birth to the somewhat smaller calves sired by Angus bulls.
2. The occasional good old cow which somehow fails to transmit desirable production to her daughters.
3. The lowest producers of the poorest families, with or without bad udders or other marked type defects.

William F. Schaefer, Jr., Mgr., NEPA Artificial Breeding Cooperative at Tunkhannock, Pa., serving Northeastern Pennsylvania, wrote on December 20, 1950, "We added Angus bulls on July 1st and in 5 months have bred 993 cows to them out of 16,300 total services, which is about 5½%. The Angus Service has been added primarily for the three reasons you enumerated and chiefly to supply a beef animal or two for farm consumption. Our members seem quite interested and this service is the result of their demands. The breeding efficiency of Angus as used in this and other cooperatives has been quite good. Some breeders resort to it after having difficulty in settling good cows to bulls of the same breed. Sometimes the cross will result in pregnancy in such cases."

In pointing out the favorable experience of Northeastern Pennsylvania dairymen in getting hard-to-breed cows settled by Angus bulls, Mr. Schaefer in the above has added a fourth classification of cows. Certainly all of us would rather have a fresh cow with an Angus calf than a non-settling cow headed for the butcher.

A well-selected Angus bull can be depended upon to get a black, chunky, smallish calf out of whatever dairy cow he is bred to, regardless of her color. The half-blood Angus steers make good early maturing beef for home or market. So do the halfblood Angus heifers. The artificial use of Angus bulls in dairy bull studs is spreading in several areas of the nation and includes Massachusetts. The cooperative and proprietary artificial breeding services cannot be expected to add the Angus breed except upon demand sufficient to warrant buying and maintaining the bulls. Dairymen who are without it but will support it on one or more cows per year can probably hasten the arrival of the service by asking for it through their regular artificial breeding channels or, if preferred, through AMERICAN AGRICULTURIST. For those who are partial to some other beef breed, it might be well to add that up to now, apparently all of the beef bulls added to dairy bull studs have been of the Angus breed.

### CHAFF

**T**HE late great H. E. Babcock, who founded this page called "Kernels, Screenings and Chaff" and wrote it for 18 years, confined his utterances almost entirely to Kernels and Screenings. He almost never reverted to chaff except in writing about the personalities of certain of the animals at Sunnyside. If the readers of the page as alternately conducted by Johnny Babcock and myself have been charitable enough to regard our offerings as either Kernels or Screenings instead of Chaff, then the following can properly carry the last named title.

No effort will be made to defend any of the statements appearing under the title of "Chaff."

While a few of the best farmers in the Northeast may keep two or more dogs for hunting purposes, the old belief still continues that good farmers keep one dog and poor farmers two dogs; sometimes three.

*Heavy milking cows in any stage of lactation, when on pasture, graze more rapidly, in a wider swath, and sweep it cleaner. This is another way of saying that good cows can be judged by standing in front and watching them graze.*

EDITOR'S NOTE: To the above most excellent program I think many farmers in the Northeast should add the growing of more corn for grain in order to cut the high cost of purchased concentrates. The earlier maturing hybrids, corn picking equipment, and the increasing cost of feed brought from the West are reasons why more eastern farmers should grow more of their own corn.—E.R.E.

### NEEDED—Artificial Service by Angus Bulls

**I**N common with thousands of farms, Hayfields now has more forage producing capacity than is needed for raising cattle to replace those that go out of the milking barn. Also in common with many, we have a little more dry-stock barn room than is strictly needed for raising dairy replacements. We could use the excess farm and barn capacity to grow a few beef cattle. But we don't want to buy beef breeding stock. Why not use Angus bulls to get

## Service Bureau

By H. L. COSLINE

### PHONY ADDRESS

Last December, a couple of men called at my home and sold me a used vacuum cleaner. They claimed to be representing the Rochester Westinghouse Agency, 122 Genesee St., Rochester, N. Y. The cleaner did not prove satisfactory; and since the salesmen had given us a written guarantee of one year, we wrote the company. Our letter was returned marked "unknown." We are out \$35, and wonder if there is anything you can do to help us or to put a stop to such activities so that others will not get cheated.

On checking, we found that no such company is listed in the Rochester directory or telephone book, neither is there any such address in Rochester. If these fellows should show up somewhere else, we would like to know about it. It would help a lot if we could have their license number. The fact that they gave a "phony" address would seem to indicate that these men are not operating on a legitimate basis. Anyone knowing their present whereabouts should write the Service Bureau, Box 367, Ithaca, N. Y.

— A. A. —

### POOR PAINT

I have a letter from a concern in California saying that they have some paint in their warehouse in this area which they have got to move and which they will sell me at a price considerably below the going price for good paint. Do you think I would be safe in buying it?

We definitely advise against buying this paint. We are told on good authority that, on request, the company will send you a sample which you will find excellent, but that when you buy a quantity it will not be of the same quality. We are told that there has been considerable dissatisfaction with the company you mention. The inference in their letter that they have paint they must sacrifice at a low price is, in our opinion, definitely misleading. Furthermore, the cost of application of paint is such a high percentage of the total cost that it seems to us poor management to skimp on quality.

— A. A. —

### "SO-RITE"

During November, the Service Bureau had three complaints against So-Rite Fashions, 385 Gerard Ave., New York 51, N. Y., in connection with orders improperly filled or never shipped. As each complaint reached us, we wrote the company about it. Soon after writing these letters, they began to come back, unopened and marked "Refused."

In an attempt to find out what the score was, we checked with the National Better Business Bureau. They in turn presented the complaints to So-Rite Fashions, but heard nothing from them.

In view of the circumstances, the subscribers who made complaints to us are being advised to send a complete report of their experiences to the Federal Trade Commission, Washington 25, D. C. In case there are other readers who have suffered losses through dealings with this company, we feel this information should be made available to them through the Service Bureau column. Perhaps if there are enough complaints lodged against them, So-Rite Fashions will be persuaded to make restitution.

— A. A. —

Numbers of subscribers have asked where they can buy stories written by C. A. Stephens. We are glad to be able to tell our readers that four Stephens books are still available. They are: "My Folks in Maine," "Great Year of Our Lives," "Busy Year," and "Katahdin Camps."

The price is \$2.00 each and orders can be sent to Robert F. Bickford, 167 Main Street, Norway, Maine.

# Replaces Milk Safely!

### MONEY-BACK GUARANTEE ON PEEBLES' CALF-KIT

We guarantee you complete satisfaction with the feeding results of Peebles' CALF-KIT when fed to your calves as directed. Feed CALF-KIT for 7 weeks. If you are not convinced that the CALF-KIT program gives better calves than any similar program, give your dealer a written statement as to why you are not satisfied. He will cheerfully refund the full purchase price of the Peebles' CALF-KIT used by you during this feeding test.

WESTERN CONDENSING COMPANY, Appleton, Wis. • San Francisco, Calif.

Save up to 250-500 lbs.  
of milk per calf

Here's the milk replacement you've been waiting for! Peebles' CALF-KIT builds big, strong calves—with real milk-fed "bloom" and vigor. Safe because 98% of the nutrients in CALF-KIT come from milk sources, as contained in whey and whey products. It also supplies guaranteed available amounts of Vitamins A, D, and Riboflavin. Try Peebles' CALF-KIT. See how it produces better calves at less cost to you!

# NEW INTERNATIONAL HARVESTER cooler

## gives you fast "TRIPLE-ACTION" chilling

**1** NEW ice bank control gives you Action No. 1. Supplies a big ice bank reserve to absorb milk heat fast... chills all the milk in cans to below 50° in less than one hour. Chilling continues until temperatures are as low as 33°. This quick continuous chilling assures quality milk even on hottest days.

**2** NEW agitator control gives you Action No. 2 with regulated, pneumatic ice water agitation. Fast-moving ice water is forced all around the cans for rapid, uniform chilling. Now you can start ice water agitation when you want. There is no waiting. Stops automatically at the time selected up to one hour.

**3** NEW refrigerating unit gives you Action No. 3. This hermetically sealed unit is thermostatically controlled to rebuild ice bank to desired thickness before next milking. Now guaranteed 5 years. These triple-action features are your assurance of rapid cooling of all parts of every can at every milking.

**Built better than ever with  
NEW AUTOMATIC CONTROLS to  
check bacteria growth Extra Fast**

You get in excess of 150 pounds of ice in the huge ice bank inside the 6-can cooler. This assures you quick-chilling, winter-cold, even on the hottest days. And because the ice bank is rebuilt between milkings, an International Harvester cooler will chill its capacity twice every 24 hours.

See why IH coolers and McCormick

milkers and cream separators are first with experienced dairymen—gentle, yet positive milkers—both pail-type and for milking parlors... big capacity, trouble-free vacuum pumps... and cream separators that skim close—get all the cream. Examine International Harvester dairy equipment at your IH dealer.

**Here Is Parlor Milking at Its  
Best... Easier... Faster... Better  
...and More Economical**

You'll never know how easy, economical and profitable dairying can be until you've installed a McCormick parlor milker. Pipe milk direct from cows to cans... save labor... save heavy lifting... cut bacteria count because milk is strained at the milker, and is not exposed to outside air from cow to can.

McCormick parlor milkers have the same gentle, yet firm, milking action, the same dependable pulsator and teat cup cluster, and the same trouble-free vacuum pump as the faithful McCormick pail-type milkers. And they're easy to install in practically any type of building. Select the McCormick parlor milker or the pail-type milker that fits your dairy needs, and the size of your herd... and enjoy dairying at its best.

For all the facts on International Harvester coolers, McCormick milkers, and cream separators... see your IH dealer.

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

## Each Spring IS A P R O M I S E

**A** FRIEND of mine retired from his profession and went to southern California intending to live there the rest of his life. After one year he was back, because he and his wife missed the rolling seasons, and particularly the springtime in this Northeast country of ours.

Some years ago my brother Fay (George Duff) and I were sitting on the front porch of his farm home, on one of the first warm nights of early spring. Down through the old cow lane, the green was beginning to show along the edges of the fence and the peepers were singing in the swamp pasture. After listening a while, Fay said:

"Eddie, can you remember when you were a small boy in that long ago springtime when we moved over into the West Creek valley to a much larger farm?"

"You bet I remember!" I said. "That valley, which was much the same as it was when first settled, and that new farm seemed like a fairyland to a small boy. I think it was you who taught me how to milk my first cow. And I remember the thrill I got from gathering eggs by the milkpailful from our big flock of hens, and from tapping the trees and helping you and Father gather and boil the maple sap. Every time I smell new-turned earth in the spring I go back through memory's

lane to that old farm where I watched you strike your first furrow across the meadow on the flat, with the robins in the furrow behind you."

"Yes," said Fay. "Just now while I was listening to the peepers on this warm night I was thinking of those old days. Probably they seem better to us in retrospect than they really were, but, thank God, most of us have never entirely lost the lift of the heart that comes with the awakening of life in the spring in this Northeast country of ours. Look at those maples down there on the edge of the yard, the bare woods at the end of the pasture, and the brown fields. They seem dead—but they aren't. They're just asleep. In a short time now all of this country will bloom again with life. What more do you want in the way of a miracle than the leaves of the trees? I think about it every spring — millions of leaves, all alike, and yet all different. It's the same with grass. Plow it under, freeze it, but give it time and it's back again as green as ever. It sleeps but never dies."

So will it be with us, I trust. We shall not die, but fall asleep to rest until the Great Spring. With the miracle of the renewed life and beauty of each of our springtimes, the Master repeats his promise:

"I am the resurrection, and the life; he that believeth in me, though he were dead, yet shall he live; and whosoever liveth and believeth in me shall never die."

By  
**E. R. EASTMAN**

# That Good G.L.F. Seed

## *Now Ready*

## *At your G.L.F. Service Agency*

**T**HIS spring's supply of G.L.F. Seed—the quality standard on Northeastern farms for 25 years—is ready and waiting at your G.L.F. Service Agency.

Right now they are all available—the old standbys like Grimm Alfalfa, Medium Red Clover and Timothy and some new improved strains for farm trial. This is the best time to re-figure spring requirements of seed and get it home where it will be ready to use when the time comes.

### *Quality Seed Means Bigger Yield*

The difference in cost between the best seed and the poorest is a few cents per acre. The difference in yield can run to hundreds of dollars. The up-to-date G.L.F. seed program for farmers is built on research at our agricultural colleges. With G.L.F. seed you can be sure of getting the finest obtainable because nothing is left undone to see that G.L.F. seed will fit Northeastern farms.

1. 30 years of experience has given G.L.F. Seed Specialists the know-how to select, process and deliver the kind of seed Northeastern farmers need and want.
2. Crop surveys—G.L.F. makes very extensive and thorough private seed crop surveys to be sure G.L.F. seed comes from the healthiest, most productive seed crops. The seed selected comes from strains which have proved their hardiness to Northeastern climates.
3. Continuous research—G.L.F. has pioneered in the development of techniques and equipment for more effective processing and treatment of seed.

This year, when production will mean so much to every farm, it is important to be sure of the quality of the seed planted. A good thing to remember is, if you don't know your seed, know your seed man. The men in your G.L.F. Service Agencies can help you select the seed to do the best job on your farm.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York

# G.L.F. Seed Service

## Why Boys Stay on the Farm

YOUR editorial on "grandma cows" was very interesting and I thought you might like the information about one "great-great-great-grandmother cow" which we have here. In addition to fulfilling her job at the milk pail, she has been instrumental in another job which I am sure you will agree has been even more important.

Back in 1937, when Floyd, Jr., was less than 10 years old, we were looking for a purebred Holstein heifer calf for him to use in his (we hoped) 4-H project. We finally located one. Kandarque Colantha Pride was her official registered name, and apparently she had a lot of ancestors tracing to the family of Pride cows at Cornell. We put the calf in a sack in the back of the car and from then on she was Floyd's calf. She got the best of feed and care and when old enough she got choice patches of pasture around the buildings along with her other feed. As a calf (and since as a cow) she appreciates attention.

Floyd began showing her at the Tompkins County Fair the first year he had her and kept doing so until I think he was ruled out by age. Although not as large as some cows, she had a splendid conformation and an udder that some judges described as "almost perfect," and Floyd never failed to come home with a blue ribbon plus other prize awards.

Her first two calves were heifers and we still have one of them. She had no more heifer calves until last year and this year. We used one of her calves as a herd sire and sold the rest. She has had a calf every year since a two-year-old and once, in one twelve month period, calved twice.

She is still going strong, still gets a little extra attention, and I will keep her in the herd as long as she can stay. I might add that we do not seem to have much trouble keeping cows to an age that seems like a long time to most dairymen. However, while we plan to feed them to get good production, I have never felt that one could do so if one was continuously trying for the last possible pint of milk.

As you know, Floyd has been very active, until age caught up with him, in 4-H activities. I think he earned most of the awards possible. The trip to Washington and the AMERICAN AGRICULTURIST scholarship to Camp Minawanka were probably the two which made the most lasting impression on him. I offered all the encouragement possible but I think this cow helped a great deal to keep up his interest. He paid for her himself, in various ways, and I wanted him to have the pride that comes with ownership.

Every once in a while some farmer asks me how I kept Floyd interested in 4-H and usually their story is pretty much the same. "We gave our boy a purebred heifer calf and he won't even take care of it." I tell them sell him the calf, and then let him assume the responsibility of caring for it. If he forgets now and then, as boys will, take care of it but don't let him know you did it. If it is his calf and going to be his cow, most boys will, if given any chance at all, take some pride in what they accomplish with it. It follows along that dad has some pride, too, in seeing the boy succeed.

It shouldn't be too hard to find a lot of great-great-great-grandmother cows, but I wouldn't expect that there would be too many that have had the means of adding inspiration to a 4-H Club boy to achieve more than usual success in his club work. And I am sure the contacts made there and the lessons learned have contributed much to the building of character.—Floyd E. Morter, Freeville, New York.

### Look at all these EXTRA FEATURES!

Yes, you can believe your own eyes . . . You can take a good look and see why Firestone Tires pull better and last longer.

**Notice the bars.** You'll see they're curved to cup and grip the soil for a firm, sure hold to eliminate slippage.

**Examine the openings** between the bars. See how they flare out at the shoulders to permit automatic soil release. You'll

notice there's no "wedged-in" pinching nor bar-end soil cramping.

**Look at the treads** of these tires. Observe how wide, how flat they are for full traction contact, long, even tread life.

Only Firestone gives you all these extra features. Only Firestone gives you your choice of top quality in either Open Center or Traction Center design. So, before you buy, LOOK!

**ALWAYS BUY TRACTOR TIRES BUILT BY FIRESTONE,**  
**ORIGINATOR OF THE FIRST PRACTICAL PNEUMATIC TRACTOR TIRE**

Listen to the Voice of Firestone on radio or television every Monday evening over NBC

## A LONG TIME DEBT

**R**EPORTS indicate that the prices of farms sold are rapidly increasing. Therefore, if you are thinking of buying a farm at these prices, remember that unless you have cash you will probably be paying for that farm over a long period, possibly from twenty to thirty years. In that time, probably during most of it, the prices of the products you sell from that farm will be far lower than they are now.

Putting it another way, at a time when farms are selling at big prices it is very easy to get saddled with a farm debt that will make a prisoner of you for the rest of your life.

This farm capitalization problem is another example of the way our young people are losing the opportunities their fathers and grandfathers had. To buy, equip and stock a farm big enough so that a family can make a living from it now costs from \$15,000 to \$50,000. In former days all a young man and his wife needed was a good team, a small amount of simple equipment, some inexpensive stock, a few hundred dollars—and all kinds of ambition.

## WHAT THE RURAL CHURCH NEEDS

**W**ITH MORE gadgets than our fathers ever dreamed of, with higher standards of living than ever before, isn't it strange that nearly everyone is so upset, dissatisfied and unhappy? The reason is that our spiritual progress has not kept pace with all the wonderful things that have been done along material lines. That is why we of AMERICAN AGRICULTURIST have always been interested in supporting the rural church, and I call your special attention to Paul Work's story about it on Page 18.

What every church needs, particularly the rural church, is the support of more laymen. What can you expect of a pastor with salary so small that he is worried all the time about educating his children, or even—as is sometimes the case—over obtaining the bare necessities of life? We should get rid of the "charity" idea in connection with the minister's salary and other church expenses. If the church could have the same fine support of laymen that most farm organizations do, or for example the Boy Scouts, how much more effective it could be!

## IT'S A MUST

**I**N PLANNING your great spring campaign to produce this year's food, it is to be hoped that you will not leave out plans for a first-class farm garden. A farm garden is always good; this year, with prices where they are, it's a must.

Unless you have a garden you have no idea of the satisfaction that my family derives from being able to get almost everything we eat, including our own home-grown meat, from our own farm and out of the freezer. Nothing adds more to a farmer's independence than his own home-grown food picked from his own garden and frozen or otherwise processed.

## THE ROAD TO RUIN

"The day will come when we will force the United States to spend itself into destruction."

—*Lenin, Russian leader.*

**N**EVER in my life have I seen so much dissatisfaction on the part of nearly everyone I know as there is now over President Truman's budget and the whole general tax situation. One man expressed the general feeling to me when he said, with all the emphasis at his command, "They taxed me twice"—meaning that he couldn't deduct his Federal income tax from his State income tax.

But the real criticism is on Truman's insistence that in addition to all the money needed for national

*By E. R. Eastman*

## IF YOU USE BALING WIRE OR BINDING TWINE, BE SURE TO READ THIS

**A** SHORT time ago, Bob Burnette of Skaneateles, Executive Director of the New York State Farm Equipment Dealers Association, called my attention to the fact that equipment dealers had very little baling wire on hand, and that unless it was possible to make sure of a supply, farmers with baling machines would just be out of luck.

I immediately called U. S. Senator Herbert H. Lehman by telephone and asked him to do what he could to make sure that the military demands did not cut off this highly essential material for farmers. Senator Lehman, knowing what this would mean, immediately took the matter up with officials of the U. S. Department of Agriculture. Mr. Burnette also wrote directly to the USDA official who has charge of this matter.

As a result of these prompt actions, both baling wire and twine for farmers have been put on the priority list. However, every user should make careful note of the procedure necessary to insure his supply. Go immediately to the equipment dealer with whom you regularly trade. He will have a form called "Defense Order 97." You will need to fill out this blank for the amount of wire or twine you will require, and your dealer will forward it to the proper authorities for attention. The dealer himself cannot order either twine or wire; you have to order it yourself through him.

Now, don't neglect this matter, or you may find yourself ready for haying or harvesting and no wire or twine available.

defense, there must still be billions of dollars spent for socialistic schemes.

As a result of the tax situation and of the general lack of confidence in either the Republican or the Democratic political leadership on both foreign and domestic policies, there is little patriotic desire or feeling either to pay taxes, or buy bonds, or to support the government in many other ways.

That sort of situation, of course, is dangerous, but it will continue to exist until there is leadership that can inspire confidence in the people.

## WORK CLOSE TO BARN

**O**N THE home farm where I lived as a boy there was a long hill, at the top of which was a meadow of perhaps four or five acres. Every spring the dug road which led up through the pasture to the meadow washed out, making it necessary for us to work several days every year putting the road in order so as to get two or three loads of poor hay off the back meadow. I remember always arguing with Father about spending so much time and work for nothing.

The matter is brought to mind again by John Babcock's comment in "Kernels, Screenings & Chaff" in this issue about using fertilizer and working the meadows and pastures nearest to the barn. There are few pastures or meadows that cannot, under right treatment, be made to produce from fifty to a hundred per cent more than they do now. With the high cost of labor and its scarcity, it is just plain common sense to improve pastures and meadows nearest to the barn, even though they are fairly good to start with.

## EAT MORE POTATOES

**I**N SPITE of the important part Irish potatoes play in our diet today, it is interesting to know that the chances are your great-grandpa never ate them very much, for they were not in general use until after 1850. When I was a boy we ate potatoes three times a day. Now many people eat them only once a day or even only a few times a week. This is indeed unfortunate, not only from the standpoint of potato growers but because potatoes are an excellent food.

Dr. C. M. McCay, Cornell Professor of Nutrition, says rightly that potatoes deserve a more important place in the national diet. He points out that they are not likely to be destroyed in time of national emergency like grain or hay in the fields, as they are easily kept in the cellars. "We could," Dr. McCay says, "if necessary without machinery produce enough of them to eat." He adds that if everyone would eat less sugar and more potatoes, we would have better health in America.

## THE ANSWER TO HIGH PRICED CORN

**A** CORN BELT hog grower said recently that an efficient farmer could make a profit on feeding corn to hogs at a price even as high as \$2.25 a bushel. If that is true, where do you think the Central West corn and hog producer will market his corn? If price controls continue in effect, eastern feeders can get caught in the pincers, for of course, the western corn grower will feed all of his corn to his own hogs or sell it to his nearby hog-growing neighbors, unless there should happen to be a tremendous corn crop with a surplus. Unless there is such a surplus, or unless the price of pork materially declines, the eastern poultry and dairy feeder will be out of luck.

One answer to this problem of high priced corn is for the northeastern farmer to grow more of it on his own farm. As AMERICAN AGRICULTURIST has pointed out many times, that is possible and practical now where it wasn't a few years ago, because there are now hybrid varieties that will yield well and mature early, and because corn for grain can be harvested with a mechanical picker, thereby saving a large amount of hand work.

## EASTMAN'S CHESTNUT

**Y**EARS AGO at Freeville Junction, N. Y., passengers often spent hours waiting for trains, because four trains met there twice a day and none could leave until all were in. One traveling man said he had spent forty years on the road, 39 of which were spent waiting for trains at Freeville Junction.

Last time in this corner I told some "slow train" stories and asked readers for more. They are still coming in! One of the best was an old poem sent in by Edward Ozmun of South Lansing, New York, printed years ago in some local newspaper. Space will not permit the printing of all the verses, but here are two of them:

My Pa he is a traveling man,  
Pa goes most everywhere;  
And sometimes, too, my Pa comes home  
When he has time to spare.  
One time when Pa came home he brought  
A very pretty cane  
He'd whittled out at Freeville while  
He waited for the train . . .

Last week when Pa came home, you bet  
We children all were "skeered."  
We didn't know our Pa because  
He wore a great long beard.  
Pa says to me, "Now don't get mad,  
Nor think I've gone insane,  
My whiskers grew at Freeville while  
I waited for the train!"

# AA's Farmers' Dollar Guide

**A**SIDE from indicating that "the sky is the limit" on food production, Washington has done nothing to encourage farmers to increase production. Administration policy makers must be convinced of the danger of too little food before situation can be corrected.

**SUPPLIES:** U. S. Department of Agriculture is supposed to tell "higher-ups" what agriculture needs to do the job. Farm organization spokesmen say USDA hasn't been consulted and is not sufficiently militant in presenting farmers' needs. Congressman Abernethy of Mississippi warns "that hungry bellies and higher prices will result."

To date, procedure has been to allocate scarce materials to all other groups and to give agriculture what's left, if any. Among expected farm shortages are superphosphate, spray materials, machinery including anything made of steel, containers, etc.

**FARM HELP:** Selective Service is notifying local boards to go easy on essential farm workers. Some draft boards are better aware of farm needs than others. USDA Under-Secretary Clarence McCormick told House Agriculture Committee: "It is absolutely essential that agriculture retain enough key men to provide the skills needed for planning farming operations, operating farm machinery and directing work of inexperienced laborers." If this isn't being done in your area, it is time to yell.

**PRICE CEILINGS:** Well-understood principle that the way to get more production is to give price incentive—a principle always used in building planes, tanks, and guns—is ignored when it comes to food production. On the contrary, suggestions are being made that price ceilings should be imposed on foods, including those selling below parity.

Price ceilings—in so far as they have been ordered—were imposed under pressure from labor unions and consumers. They are not working well! Resulting uncertainty is one of our biggest production handicaps. No one, either in industry or agriculture, knows what to look for next.

Evidence mounts that in spite of unrelenting opposition of most farm organizations, food subsidies may be crammed down farmers' throats in attempt to fool consumers into thinking they can have high wages and cheap food at the same time.

**MILK:** Total U. S. milk production in 1950 was 120.6 billion pounds—1% above 1949 and only 1% below the record made in 1945. Dairy cow numbers were practically unchanged; milk production per cow 1% higher. U. S. milk production in January was 1% below January last year, but 5% above the 1950-49 average for the month. However, production per capita for the month was below last year and the 10-year average.

**LIVESTOCK:** U. S. livestock and poultry showed an increase on January 1 for the second successive year. This year, numbers were 4% higher than a year ago but 13% below the January 1, 1944, peak. There was a 4% increase in sheep, first gain since 1942. Number of chickens was 3% below last year.

During 1950, meat production was 20,219 million pounds—3% more than in '49 and 5% above 1948. Higher meat prices are not caused by scarcity! 1950 beef production was up 1%; pork production up 6%; veal down 8%, and mutton and lamb down 1%.

**POTATOES:** On February 1, combined grower and dealer holdings of potatoes were 125,740,000 bushels—2% above the same date last year. Compared to a year ago, stocks were smaller in the East, about the same in central states, but larger in the West.

**TIMELY HINTS:** At present price of veal calves, a good way to use kickers, 3-teaters, and cows affected with mastitis is to raise veal. Raising what grain you can handle with your normal labor supply looks like good insurance. Feed prices are uncertain enough to go slow on stocking up; however, keep enough on hand so you won't run short. At present fertilizer prices, use plenty; get it on your farm soon. Check on beef prices and consider selling low producers now.—Hugh Cosline

## The Song of the Lazy Farmer

**A**FELLER came around today to tell me how much it would pay if I'd put in more thought and toil on being kinder to my soil. He said he'd draw me up a plan to show exactly how I can keep dirt from washing down the crick and grow alfalfa twice as thick. He told me all my fence is fine, except it's in too straight a line; my crops should be in crooked rows, he said, like those that neighbor grows. The gullies should be dammed or filled, and he suggested that I build a pond to let the water store, just like a city reservoir.

It's plain enough for me to see that this guy hasn't heard of me. Just think of all the work I'd catch to build those fences up from scratch; to lay out contours I would tramp until each leg was one big cramp. If I wiped gullies off the map, where would I put my junk and scrap? A pond sounds dangerous to me, suppose Mirandy drowned, by gee. It's likely that more weeds would grow wherever there's a crooked row; I couldn't plan to rest a day, I'd have to get out there and spray. More income, sure, like neighbor makes, but is it worth the work it takes?

# Different.... from all the others!

## When You Farm With the FERGUSON TRACTOR AND FERGUSON SYSTEM IMPLEMENTS

**H**ERE'S the superior team that saves you time, money and effort. You'll feel and see the difference the first time you put a Ferguson tillage tool like the three-Plow Conversion unit (above) into the soil. The Ferguson System gives you so much: Three-point converging Implement linkage, fingertip and Automatic Implement Control, Automatic Steering Alignment and Automatic Draft Control — these are just a few of the many advantages you get from this revolutionary system.

### TRACTOR MOUNTED DISC PLOW

Now there are over 60 Ferguson Implements to convert Ferguson Tractor Power to useful productive work. The tractor-mounted, fingertip controlled Ferguson Disc Plow (At left) is an outstanding example of Ferguson advanced engineering. Exclusive floating furrow wheel for side draft control without land wheels or weights.

### RIGID OR SPRING-TINE ROW CROP CULTIVATORS

Just watch the row ahead—Ferguson linkage action and the side pressure of the soil on the automatic steering fin cause the cultivator to follow the front end of the tractor automatically. You'll find it much easier than keeping your eyes glued to the shovels next to the rows. Cultivate cross-checked rows, or rows planted on the contour with ease. One minute, three point attachment, complete hydraulic control at your finger tips.

**OVER 100 FERGUSON** dealers in New York and New England are ready to serve you. For information about the full line of Ferguson tillage tools engineered to help you farm better easier, see your Ferguson dealer today.

Use the coupon below for quick and complete information about Ferguson System Implements for your farm.

# MASTITIS is Costly!

Give Your Milk Profits Top Protection

Use **VETERINARY**

## AUREOMYCIN

Crystalline **OINTMENT**

*Lederle*

**For Udder Infusion**

The Drug with the Widest Range of Activity against Bacteria Commonly Found in Mastitis

- More effective than penicillin
- Easy to infuse
- Flows freely—spreads rapidly
- Active for more than 48 hours
- Brings quick results in salable milk

In cases of acute septic mastitis, in addition to udder infusion, the injectable form of SULMET\* Sulfamethazine *Lederle*\*\* should be used. Subsequent treatment may be conducted with SULMET OBLETS\*.

VETERINARY AUREOMYCIN *Crystalline* Intravenous\*\* may be used in the treatment of severe septicemia as a highly effective agent against a broad range of bacteria.

VETERINARY AUREOMYCIN OINTMENT may also be used for the prevention of superficial udder infections. When injuries to the udder or teat occur, it is advisable to apply this ointment locally to the wound, and at the same time infuse the quarter adjacent to the wound with one full tube of AUREOMYCIN OINTMENT as a preventive measure.

For maximum efficiency in the use of AUREOMYCIN OINTMENT For Udder Infusion, as well as best management practices and disease-control procedures for avoidance of reinfection, consult your veterinarian.

Write for folder on AUREOMYCIN OINTMENT.

Art Wager, left, veteran show clerk of the Steuben County Potato Growers Convention at Cohocton, N. Y., watches Prof. Ora Smith of Cornell University appraise exhibits.

## New York, Penn Growers Hold Winter Meetings

WASHINGTON'S Birthday was potato day in Western New York and Northern Pennsylvania as potato growers and specialists from many areas gathered for meetings held at Cohocton and Wellsville.

Marketing was the theme of the 24th annual Steuben County Growers' convention held at Cohocton, New York, February 22-23; while Better Growing Practices was one of the chief topics at the Allegany-Potter Potato Show held at Wellsville.

Featured at the Steuben County meeting was a display of the potato packs of county shippers and samples of certified seed crops. There also was an exhibit of processed and pre-peeled potatoes, a freak show, and the Battle of the Bulls, as the contest for heavy-weight championship is called. Eighteen speakers from five different states appeared on the program, which was sponsored by the Steuben County Farm Bureau as an aid to the program for "better potatoes and more profits."

Carrying out the theme was a forum discussion on marketing the crop, in which Carl Sehindler of Loblaw Groceries of Buffalo; Lee Schultheis, resident buyer of Kroeger Company; and Joe Neylon, potato shipper of Avoca, New York, participated, with Professor Maurice C. Bond of Cornell as moderator. Among the other speakers were Porter Taylor, Director of the Fruit and Vegetable Division of the American Farm Bureau Federation; and Sturges Dorrance, who has directed the advertising program of the State of Maine potatoes since the program's inception.

Professor Ora Smith of Cornell again judged the potato exhibits, and Art Wager of Cohocton was clerk of the spud show for the 24th time.

The 8th Annual Potato Growers' meeting at Wellsville also featured a show which attracted more than 100 exhibits from nearly 100 of the best adult and junior potato growers in Allegany County, New York, and Potter County, Penna. Professor A. J. Pratt of Cornell University was judge of the show which featured exhibits of Katahdins and Smooth Rurals, with smaller showings of Russets, Sebagoes, Pontiacs, Tectons and Kennebecs.

Dr. M. W. Meadows of Cornell, spoke twice at the Wellsville meeting and again the next day at Cohocton, discussing fertilizing potatoes in 1951. He advised growers not to skimp on fertilizer, seed or spraying practices in an effort to save money, claiming that the best bet is to plant fewer potatoes and give them better attention.

Stating that in growing, "Soil is the most important factor but the cheapest because it involves less than two per cent of the total cost," Meadows said, "Nevertheless, if the soil doesn't give you results, get off it and get some that will."

He told of recent experiments in which he tried various fertilizer ratios with the result that a 5-5-5 fertilizer may be better than the customary 5-10-10. "The results show a build-up of phosphorus and potassium in the soil, but a need for nitrogen, which tends to prove that the most economical yield will come from a 1-1-1 ratio." He pointed out that this will mean a saving to the grower of \$14 per acre on phosphorus and potassium.

The extension specialist also pointed out that growers could save labor, time and money by adopting chemical weed controls, using pre-emergent sprays a day or two before potato sprouts break ground.

Some recipients of awards at the Allegany-Potter Potato Show were, from left, front row: Joseph Brandes, Wellsville, highest 4-H individual judge and junior sweepstakes winner; Richard Sherwood, Wellsville, 2nd youngest junior award; Gladys Sherwood, Wellsville, 1st junior award. Back row: Lyle Slocum, Andover, 3rd individual judge; Richard Nye, 2nd individual judge; Robert Dunham, who works for Ed Kent of Andover, won the 1st hired man award.

# Farmers Can Pull THEIR OWN WEIGHT

By **EDWARD S. FOSTER**

General Secretary New York State Farm Bureau Federation

THE following is a resolution adopted by the board of directors of the New York State Farm Bureau Federation on February 6, on controlling inflation and reducing government spending:

In the defense of our country against communism, it is clearly evident that the production of essential materials will in large measure determine the outcome of the conflict.

In controlling inflation it is our firm belief that:

1. Credit for consumer purchasing must be reduced to a minimum.

2. Manpower must be used for production of essential goods and services.

3. Our defense program must be paid insofar as possible out of current income, for further borrowing by an already overspent government would encourage inflation and add to our future problems.

4. Non-essential government spending must be stopped.

Be it resolved that we vigorously recommend that agriculture take the leadership in this country in reducing non-essential government spending. It is our firm opinion that the great majority of farmers in New York State, in the interest of economy and reduction in government spending, believe that Congress should immediately bring to an end the use of public funds for the purchase of such materials as lime, superphosphate and any other fertilizer materials, or other services and payments given to farmers through programs of the U. S. Department of Agriculture.

DELAWARE  
Case No. 3405

## "My Chicks Go to Market for 1<sup>4</sup>/<sub>10</sub> Cents per Mile!"

—says JAMES STAFFORD  
Poultryman of Middletown, Del.

He drove a 1950 Ford F-1 Panel equipped with POWER PILOT in Ford's nationwide Economy Run. He says, "It sold me on the over-all economy of Ford Trucks."

Poultryman Stafford has been raising chicks for 15 years . . . owns four Ford Trucks. He says "Ford's Economy Run showed me how to save time and money . . . helped me keep track of hauling costs. For example: In six months I traveled 8195 miles with an average load of 1300 lbs., had no repairs, made 735 stops. I spent a total of \$115.94 for gas, oil and maintenance, giving me a running cost of only 1.41 cents per mile."

Like others who rely on Ford for greater savings—you'll like the regular, excellent service you get from your local Ford Truck Dealer. And, for more facts on the trucks that last longer *and* save you money every mile—mail the attached coupon.

Stafford and driver haul chicks and eggs to market, operating his truck 8 to 14 hours a day.

This new Ford F-1 Pickup for '51, like Stafford's F-1 Panel, is America's No. 1 Economy Value. It features new steering

column gearshift for passenger-car shifting ease. With over 180 models to choose from, there's a Ford Truck to fit your job.

## Ford Trucking Costs Less Because— FORD TRUCKS LAST LONGER

Using latest registration data on 6,592,000 trucks, life insurance experts prove Ford Trucks last longer!

### POWER PILOT helps POULTRYMEN hold down hauling costs

The Ford Truck Power Pilot is a simpler, fully-proven way of getting the most power from the least gas. This carburetion-ignition system automatically meters and fires the right amount of gas, at precisely the right instant, to match constantly changing speed, load and power requirements.

Unlike conventional systems, the Power Pilot uses one control instead of two, yet is designed to synchronize firing twice as accurately. You can use regular gas . . . you get no-knock performance. Only Ford in the low-price field gives you Power Pilot Economy!

**makes higher yielding corn crops"**

*"I have used Swift's BLENN for two years and am well satisfied with it. In comparison with another brand, BLENN fed through the corn planter attachment better, the corn matured faster, and the BLENN-fertilized corn yielded higher. Next year, I am going to use BLENN on all my corn and oats."*

*L. R. Bake,  
Oelwein, Iowa*

Good farmers, like Mr. Bake, strive for bigger yields of corn, oats and other grains. And they find the surest way to increase production from every acre planted is to feed their crops BLENN, Swift's specialized crop maker.

Here's why BLENN works so well. Feeding BLENN to crops is like feeding a good supplement to livestock. The growth elements in BLENN balance the natural plant nutrients in your soil. Then your crops get all essential growth elements needed... and that means higher yields, improved quality, and more money from every acre.

#### **BLENN is chemically hitched**

New process BLENN is made by an exclusive method developed by Swift. Complete mechanical mixing is followed by complete chemical processing. All growth elements in the formula become *chemically hitched* together in each granule. Growth elements can't separate out as your planter joggles over the field.

#### **More uniform 4 ways**

Swift's New Process also makes BLENN more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform distribution through your ma-

chines; 3) uniform freedom from caking, lumping, bridging; 4) uniform feeding of your corn and other crops.

You'll want to make sure you get all the New Process BLENN, you'll need for your corn and grain crops. Shortage of plant food materials is again a possibility. So see your Authorized Swift Agent or dealer right away and order your BLENN.

**\$1.00 for plant food  
brings back \$7.00**

It has been found that a ton of plant food applied to a pasture will, on the average, produce 1,000 pounds of beef or 8,000 pounds of milk. Stated differently, each dollar invested in plant food for pasture will return up to \$7.00 in income to the farmer.

To help you grow better grass—America's greatest crop—we have prepared an informative new booklet, "A Guide to Better Pastures." We'd like you to have a copy. Please write to Swift & Company, Plant Food Division, Chicago 9, Illinois, and we'll send your copy on receipt of your letter. This booklet is *free!*

## **New England Agronomists Choose Fertilizer Grades**

By J. S. OWENS

**F**ERTILIZER grades based upon ten ratios of fertilizing elements are ample for New England. This was the conclusion reached by representatives of the Agronomy departments of the six New England Agricultural colleges meeting in Boston recently. On the day following they presented their recommendations to the fertilizer manufacturers who supply practically all of the commercial fertilizers used on New England farms and gardens. The manufacturers expressed keen interest in measures which would aid in simplification for farmers and thereby effect a more efficient use of their products. They are also anxious to adopt any practice which will facilitate plant operations.

Since the supplies of materials and manufacturing equipment varies, more than one concentration may be made with the same ratio of plant nutrients even by the same manufacturer. This accounts for choosing ten ratios which serve as the basis for multiples of any ratio.

#### **One Ratio—Several Grades**

The third ratio in the list below is a 1-1-1. That's easy. The common grade of this ratio is a 7-7-7. That's familiar too. This grade has 7% nitrogen, 7% phosphoric acid ( $P_2O_5$ ) and 7% potash ( $K_2O$ ); 100 pounds contains 7 pounds each of nitrogen, phosphoric acid and potash. In a ton there are 140 pounds of nitrogen, 140 pounds phosphoric acid, and 140 pounds potash. The grade could also be a 10-10-10, which is a 1-1-1 ratio with 10% of each fertilizing ingredient. The proportions are the same as in the 7-7-7 but only 70% as many pounds are needed to supply the same plant nutrients. When more concentrated materials are available a 15-15-15 might be made, which is only another grade with a 1-1-1 ratio but over twice as "strong" as the 7-7-7.

In addition to the base ratios in the list which follows, there is the **minimum** or the lowest concentration grade which appears desirable under present conditions. The third column gives one of the higher concentration grades which has become familiar.

Ratios	Minimum Grade	"Higher Analysis" Grade of Same Ratio
0-1-2	0-10-20	0-12-24
0-1-1	0-14-14	0-20-20
1-1-1	7-7-7	10-10-10
1-2-1	5-10-5	8-16-8
3-4-4	(5-8-7) 6-8-8 (Southern New England)	
2-3-3	6-9-9 (Northern New England)	
2-3-4	6-9-12 (Maine)	
2-1-2	6-3-6	
1-1-5	5-5-15 Tobacco	

The first ratio, the 0-1-2, is a new one. This was added to supply a grade with high potash for legumes, particularly for top-dressing alfalfa and ladino clover. These crops have been shown to need an annual application of around 100 to 150 pounds of actual potash per acre on many soils. With an application of 600 pounds of an 0-10-20 (0-1-2 ratio) 120 pounds of potash ( $K_2O$ ) would be supplied and only 60 pounds of phosphoric acid ( $P_2O_5$ ) and that appears to be ample. With the use of an 0-14-14 (0-1-1 ratio grade), 857 pounds would be required to furnish the 120 pounds of potash ( $K_2O$ ) but this would also furnish 120 pounds of phosphoric acid ( $P_2O_5$ ) or more than seems to be generally needed for yearly applications.

The choice of the other ratios was derived in a manner similar to that described for the 0-1-2. The known requirements of the important crops were grouped and ratios chosen to cover these as closely as appears necessary for practical use.

The agronomists also analyzed the

need for the less familiar secondary or minor elements, magnesium, boron, manganese, copper, and zinc. The need for these is known to be confined to certain crops and even to certain soils. It, therefore, appears best that they not be included in all fertilizers but only in those for the special situations. Extra precautions are often required. Boron, for instance, (supplied in borax) is known to be beneficial to alfalfa, apples, cauliflower, spinach, turnips and several other crops. However, large amounts may be harmful and even small amounts harmful under certain conditions.

The agronomists also urged the use of the names of elements rather than those of compounds. This becomes especially important with the introduction of the many new materials which may be used to supply minor elements. Borax, for instance, is the common source of the element boron. However, the boron content of borax varies and the number of pounds of borax applied does not insure the proper amount of boron. Magnesia is magnesium plus oxygen. At present, both terms are used with only confusion resulting.

The use of the term "phosphoric acid" is especially unfortunate. The term used on the bag, "phosphoric acid" is actually not the acid ( $H_3PO_4$ ) but  $P_2O_5$ , phosphoric pentoxide, which is 2.2 times the phosphorus. Ordinary superphosphate (20%  $P_2O_5$ ) does not have 20% phosphorus (P) but only 9.1%. That would seem a small figure on a fertilizer bag but we can become accustomed to it since it gives the proper information.

#### **Fewer Grades**

It is pounds of plant nutrients applied that counts. The reduction in the number of grades, yet supplying the necessary variations in plant nutrient content, is aimed at emphasizing the "plant food" content. Therefore, the agronomists plan to recommend pounds of plant nutrients, that is nitrogen, phosphoric acid, and potash, and of minor elements, instead of pounds of fertilizer. This is not a new idea to the fertilizer industry, to agronomists or to many farmers, however, for all to use "plant foods" as a basis for recommendations and determining rates of application is new and should go a long way towards removing confusion.

The choice of fertilizer grades at this time will have little effect upon grades placed on the market *this year*, but they will be effective in 1951. The manufacturers have already prudently prepared for the coming season and will make few changes unless it is the introduction of the 0-1-2 ratio grades.

*"Men make the best after-dinner speakers, son. Women can't wait that long."*

# Start

## ***Grow Them Fast • Keep Them Healthy***

**A** GAIN this year, poultrymen — both large commercial operators and small flock owners—are making G.L.F. Chick Starter their number one choice. The basic reason is simple—G.L.F. Chick Starter is doing the kind of a job that they want a chick starter to do.

### ***The Right Combination***

The formula for G.L.F. Chick Starter is based on the performance of the feed on thousands of farms plus the latest scientific knowledge of our agricultural colleges. It is a combination of quality controlled feed ingredients which furnish the necessary *proteins, vitamins* and *minerals* for a highly efficient feed. Added to these ingredients are vitamin B<sub>12</sub> supplements and antibiotics which build stronger, healthier birds and give faster early growth.

Cooperative G.L.F. Exchange, Inc.  
Ithaca, New York

# **G.L.F. Chick Starter**

# 'em

## ***A Thrifty Way to Grow Big Calves***

**M**ILK and G.L.F. Calf Starter go together for best results in raising a calf—the kind of a calf that will grow to be a husky, healthy heifer.

G.L.F. Calf Starter is an appetizing feed—calves really get to like it in short order.

### ***Feeding G.L.F. Calf Starter***

Because G.L.F. Calf Starter is a dry feed it is very simple to feed. Offering a handful of Calf Starter to the calf is a good beginning about the time it learns to drink from a pail. After a few days all you need to do is put a day's supply in the feed box each morning.

From three weeks on a calf will begin eating more and more Calf Starter with her milk diet. At about 7 weeks milk feeding can stop and the Calf Starter increased. When the calf is consuming a good amount of high quality hay and some fitting ration the Calf Starter can be cut out. This is usually at about 16 weeks of age.

# **G.L.F. Calf Starter**

# right

## ***High Protein--High Energy for Better Poults***

**I**t takes a high protein, high energy feed to keep the pace with the ability of poults to grow fast during early life. A poult will multiply its weight 12 times in the first 4 weeks. G.L.F. Turkey Starter is formulated with these facts in mind.

G.L.F. Turkey Starter is a 28 per cent protein feed and is high in energy. Antibiotics are added as a growth stimulus which gives more uniformity of growth as well as better feathering.

### ***It's Easy to Feed***

Feeding G.L.F. Turkey Starter is not complicated. The important thing to remember is making the feed easy for the poults to get it.

**First 2 days**—Place Turkey Starter on low containers such as egg case flats. Sprinkle some grain and granite (hard) grit on top of the mash.

**Third day to 8 weeks**—Keep G.L.F. Turkey Starting Mash continuously before poults in hoppers. Keep granite grit in separate hoppers.

# **G.L.F. Turkey Starter**

lasts longer . . . requires no expensive upkeep . . .  
and is fire-safe—the Multi-Purpose

STRAN-STEEL

QUONSET

Stran-Steel and  
Quonset  
Reg. U. S. Pat. Off.

Quonset 32

The versatile Quonset is excellent for livestock housing or crop storage. Here a Quonset 32's capacity for all sorts of machinery is shown. Adequate shelter for expensive farm equipment pays for itself in short order!

Perhaps the hardest-working, least-complaining, and most versatile piece of "equipment" you can have on your farm is a Stran-Steel Quonset building!

More than just a building, the Quonset is a valuable *tool* on any farm—a production *machine* that works with you and for you.

The Quonset reduces hours of drudgery and miles of legwork. It's designed to increase volume and cut material and labor costs. Its uses are unlimited.

All over America, farmers of all kinds—in every section of the country—are ready to back up statements like this because their *experience* with Quonsets has proved the Quonset's real *value* as a farm building.

Wouldn't you—right now—like to have an all-steel, fire and wind-resistant, vermin-proof building of all-year, all-round usefulness? A building that *works* for you? See your Quonset dealer!

The Burroughs Brothers barns at Vergennes, Vt. Note that large barn collapsed, too, and the sidewall of stable is flat.

## Poorly Constructed Barns Collapse in Big Wind

By Ivan W. Bigalow

**I**N the late nineteen twenties a flood spilled its muddy waters through the length of Vermont, destroying homes, barns, bridges, and roads. Again in September 1937 water gushed across the farms of southern Vermont to repeat the performance. The summer of 1948 found the vicinity of Rutland under a blanket of water, mud and debris. The flash flood caused the Chittenden dam to break resulting in wrecked homes and damaged farmlands.

On November 25, 1950, the Vermont farmer again felt the sting of nature's lash. An 80 to 100 mile per hour wind tugged violently at the homes and farm buildings throughout the state. The high wind completely leveled many timber and sugar maple orchards. Many dairy barns could not withstand the strain of nature's pull. The barns, even though filled with hay, slid off the foundations and collapsed upon the cattle imprisoned in their stanchions. Most of the animals were killed instantly. Farmers and veterinarians crawled beneath the wreckage to mercy kill the remaining cattle.

### 35 Barns Lost

The storm centered its fury in the area from Rutland north toward Burlington with the greatest damage in Addison County where the gale destroyed approximately 35 dairy barns and killed 1,000 cattle. Many other barns were badly damaged and in need of repair.

Winston Seeley, a farmer south of Middlebury, left his farm Saturday night November 25 to escort his daughter to her piano lesson in town. Mrs. Seeley, at home with the remainder of the family, was soon concerned with the increased howling of the wind. Somewhere a tree fell across the power lines leaving her home in darkness. The front door blew open and the windows crashed letting wind and rain into the house. Mr. Seeley finally picked his way home through fields, fences and fallen trees to join his family in the nightmare.

All of Winston Seeley's barns were destroyed. His dairy barn, housing 75 head, was a twisted mass of broken lumber and wet hay. Thirty-three milch cows and ten head of young cattle were dead and could not be salvaged for beef. The tool shed laid flat upon the machinery stored in it. His sugar bush had the appearance of a spilled box of tooth picks. Mr. Seeley hung 800 buckets last year, but has no trees to tap this spring. Eventually he can replace the barn and the herd of cattle, but he can never rebuild his

sugar maple orchard.

Mr. Seeley is confronted with the problem of rebuilding a dairy barn with limited capital, but at a time when construction costs are sky high and milk returns are mediocre. He not only wants to build an inexpensive barn, but also wants a modern, efficient system where two men can handle 45 milch cows. He is seriously considering the merit of pen stabling. A barn of inexpensive substantial pole frame construction would greatly reduce building costs per cow over conventional barn construction. Some extra bedding will be necessary for the pen stable (approximately two thirds more than what should be used in the stanchion barn). Not only the cheaper construction costs but the advantages of better herd health, savings in labor and increased fertilizer values of manure appeal to this farmer.

### Reveals Weaknesses

Poor construction was the greatest cause of barn collapse. The rafter to plate connection failed first. Rafters in old frame barns laid in pockets on the plate. Rafters merely toe nailed to the plate must be securely reinforced by strapping the rafter to the plate with metal strips. Rafters may also be tied to the joists with 45 degree braces. Knee braces nailed to joist and to the studding at intervals of 8' to 10' resist side sway. A long brace from rafter to sidewall ties the rafter to the plate and greatly strengthens this connection.

The second weakest spot was the sill to foundation connection. In some cases the sill was merely set upon the foundations. The gale pushed the building from the foundation. A 5/8" bolt should be placed in the foundation wall every six feet and bolted to the plate.

The loss to farmers was a great one, but in rebuilding they can plan more efficient, comfortable stables. Large stalls for Holstein cows, (at least 4' wide and 5' 4" long), convenient cross alleys and end alleys, and wide feed alleys for the use of feed carts will be incorporated in the new barns.

Barn meetings are planned through the wind damaged area. The scale model barns used so much in New York State will be on show and discussed at these meetings. One model illustrates good conventional stable construction and arrangement. The second model is an example of pen stabling using pole frame construction.

(EDITOR'S NOTE—Mr. Bigalow, Cornell University District Engineer, is on "loan" to Vermont to help and advise the farmers who suffered such big losses in last fall's wind storm.)

## CRAINE-NATCO TILE Your Best Investment

If you value permanent, trouble-free service, you'll find a Craine-Natco tile block silo the best buy you ever made.

Each tile unit contains the maximum number of air cells, for better insulation. They're unharmed by silage acids . . . glazed for a striking beauty that lasts! You'll get more for your silo dollar, in a Natco.

## A Visit With THE EDITOR

By E. R. EASTMAN

### The Right Way to Do It

SCHOOL officials and laymen interested in school affairs in two sections of Tompkins County, New York, deserve the highest possible commendation for the way they have approached two difficult school problems.

In the Ithaca area there are 43 common and union free school districts, most of which have in years past contracted with the Ithaca City system. For many reasons too lengthy to explain here, this plan has become unsatisfactory both to the contracting districts and to the Ithaca school authorities.

Instead of a lot of emotional fault-finding, trustees elected a representative from each town to study the situation and make recommendations. From time to time meetings have been held and the public kept up to date on the progress made by the committee. The *Ithaca Journal* carried a series of very informative articles about the situation and the school laws involved.

In the Dryden area similar studies have been made relative to the advisability of bringing the whole Etna, Freeville and McLean districts into one large central school at Dryden. Meetings have been held in the different communities, called by the people themselves, and the questions involved calmly and logically discussed. The only part in either the Ithaca or the Dryden area played by the State Department of Education was to supply requested information.

As a result, when final votes are taken in both areas, there will be a full understanding on the part of every interested voter of all the facts involved. And that, I submit, is the right kind of democratic procedure.

\* \* \*

### Why Prices Are High

THE other day in a bakery, women were lined up before the counter three deep waiting to be served, and I waited half an hour before I could get to the counter. The same day I passed a meat market and stopped to look through the window at the crowd of women milling around waiting to buy, and I know that when many of them finally reached the counter they bought the highest-priced cuts.

The chief reason for high prices is the huge demand and the apparent financial ability of a large number of people to buy almost anything they want.

Of course, there are many with fixed incomes who are in serious financial difficulties because of taxes and inflation, but I don't think that the consumer who insists on the highest-priced cuts of meat and who crowds the stores to buy many unnecessary things has any just complaint about prices.

I have been particularly incensed of late by consumer criticism of farmers because farm prices below parity are not included in the price freeze. Parity is simply a device to keep farm prices in line with what the farmer has to buy. With the exception of a few commodities, prices received by farmers are nowhere near equal to those he has to pay to operate his business or run his home. For example, while farm prices have risen approximately 21% on the average since the beginning of the Korean War, the prices of textiles have risen 31%, and many other commodities to an equal or greater extent.

The Secretary of Agriculture and the Congress are right in their stand that prices of the products the farmer has to sell should not be fixed until they reach parity.

# It's Here.... BREAK-AWAY MOUNTED PLOW

## ANOTHER NEW LATCH-ON IMPLEMENT FOR CASE "VA" SERIES TRACTORS

Now Case gives you, for the first time, all the advantages of a mounted plow plus the protection of a sure-acting break-away coupling. When this new Break-Away Plow hits a rock or stump, the safety release lets go, saving shares and beams from damage. It re-couples instantly and automatically by backing tractor. It has the same one-minute 3-point hook-up as the regular Latch-On Plow, still available for farmers who have no need of the break-away feature. All Latch-On moldboard plows have a free-floating action that keeps them working at even depth through tough spots and in rough ground. See your Case dealer for a demonstration of these remarkable plows and other Latch-On implements.

## NEW ECONOMY PLOW BOTTOMS

New shares cost less than usual cost of resharpening. Do good work, wear well in most soils. Draft is light because normal wear maintains a good edge, and there is no landside drag.

## These Farmers Raise Thoroughbred Horses

By JEANNE PONTIUS RINDGE

**T**HE thoroughbred horse is the unusual crop of at least 100 plain dirt farmers of Livingston and adjacent counties in Western New York. Probably nowhere else in the world is the raising of light horses, on a sizeable and systematic scale, developed by farmers as a sideline to the regular farm program.

The Genesee Valley Breeding Association is a constantly growing monument to the memory of one woman who, nearly 50 years ago, conceived the idea that light horse raising should become a profitable farm industry rather than the hobby of the "gentleman farmer." Her foresight, determination and hard work, joined with the efforts of her neighboring farmers in the Genesee Valley, made this unusual program possible.

She was Mrs. Herbert Wadsworth, whose husband was the cousin of the "Old Congressman," J. W. Wadsworth, father of "Jim" Wadsworth, recently retired Congressman from this district. The Wadsworth family has been "landed gentry" in the Genesee Valley since early settlement days. Mrs. Herbert Wadsworth died in 1934.

Through by-laws stipulated by Mrs. Wadsworth, it is impossible

worth and now run by the Jockey Club as a public service).

Stud fees for these remarkable sires are \$15.00 to Breeders' Association members in Livingston and adjacent counties, \$25.00 elsewhere in the state, and \$50.00 for out-of-staters.

Although highly speculative, thoroughbred horse breeding is a paying business for these area farmers. Genesee Valley colts increasingly are in demand. At Saratoga sales, in recent years, Leo W. Davin of Caledonia topped the sale with a chestnut colt by Omaha, Chance Flyer, which went for \$3,800. John Steel of Avon, indefatigable worker and secretary of the breeders' association, sold a chestnut

▲ The first annual thoroughbred auction of the Genesee Valley Breeders' Association was held last summer at Ashantee estate, near Avon.

◆ Peter Hanrette, LeRoy, N. Y., with Curate, brother of Man O' War. Mr. Hanrette worked closely with Mrs. Wadsworth in establishing the Genesee Breeders' Association. He was its president for many years.

filly by Tourist 2nd for \$2,700. A yearling colt by Tourist 2nd belonging to Irving Yates of Avon brought \$1,200 last fall.

There are more farm-owned thoroughbreds and half-breds at the annual colt show at the Avon Springs Downs than at any other show

in the world. The show is sponsored by the breeders' association which now owns the once-famous Downs.

When Mrs. Wadsworth, owner of the great Ashantee estate near Avon, first conceived the idea for farm-raised horses, the demand in the main, was for hunters. Aside from the local market for them (Genesee Valley is famous for its Hunt), it was found that the rich calcium content of the limestone subsoil of the valley was ideal for producing bone and substance in horse-flesh.

Mrs. Wadsworth believed that crossing thoroughbreds with the best farm stock would produce hunting stock which would combine speed and jumping ability with the heavier-set stamina of the Clydesdales and Percherons. The cross proved highly successful.

The trend in recent years has been toward thoroughbreds, although half-breds and hunters still are in demand. Valley farmers have made the shift along with increasing demand.

## From the Editor's MAILBAG

### OUR HEALTH GAME HELPED

Am writing to give my experience in following eight health resolutions given by the Medical Society of the State of Pennsylvania, in your paper of January 20.

I think I have kept the resolutions very well, and results are very beneficial not only to my physical health but my mental attitude as well. Eating good healthful foods, yet much less than formerly, rid me of that tired feeling and gave me more pep. My eyes are in better condition, and I can actually think more clearly. I feel younger, too. Won't make my letter long by writing about all eight resolutions, but each one helped a lot.

Thank you very much for printing them in your very fine and helpful paper, the AMERICAN AGRICULTURIST, which I have taken for many years and sure hope to continue to take many more.—I.M.W., Maine.

—A.A.—

### INGENUOUS

"I have an assignment in school. It is to write a composition on the improvements (since the Civil War) in agriculture — both in machinery and crops. I would like to have you write a composition for me of about 500 or 600 words on the improvements in agriculture since the Civil War."

EDITOR'S NOTE: The ingenuity of the young man who wrote us the above letter intrigues us. He should go far. For your information we accommodated him to the extent of giving him some definite suggestions which we hope he can use to advantage in writing his OWN composition.

—A.A.—

### QUESTIONS FOR '51

Congratulations on your switchmen's strike editorial. Which brings up questions for 1951 to answer:

1. Why did switchmen strike while our boys were dying in Korea?
2. Why have we had the New Deal for 18 years?
3. Why is Labor Socialism ruining Britain?
4. How did Mao's Communists conquer China's 462,000,000 people?
5. Why is Stalin the worst world danger in the 700 years since Genghis Khan?

There are two standard ways of finding the answers to these questions. The first is an easy way, what we might call the "human nature" way. This way consists in first deciding what answer we wish to find, no matter whether it is the right answer or not.

The second way is the scientific method taught us by Liberty Hyde Bailey and the late Dr. George Warren. Every industrialist who wants to escape bankruptcy uses it in his daily business. First, get all the facts, the unpleasant as well as the pleasant. Next, draw the conclusion warranted by all the facts. Third,— act on that conclusion.

When John D. Rockefeller retired at 70, the richest man in the world, a friend asked if he would now divulge the secret of Standard Oil success. He replied "Yes, it was that we never tried to fool ourselves."

When we use the Bailey and Warren scientific method for study of our 1951 questions—when we, like Rockefeller refuse to try to fool ourselves—we find that the questions of the switchmen's strike, the New Deal, British Labor

Socialism, Red China, and world danger from Communist aggression all go back to the same cause.

The answer to these questions is that since 1917 we have lived in a world revolution, whether we faced the fact or not. Russian Communism, Chinese Communism, Labor Socialism, the New Deal and the switchmen's strike are all the same thing under different names and disguises, nothing more or

less than gang war for gang robbery. We live in a world civil war. Every nation has a Communist gang, a Socialist gang, or a New Deal gang, determined never to stop until it has robbed and ruined everyone outside the party gang of thieves.

Everyone hopes that if he sits down on his fundamental posterior and does little or nothing at all, then in some wonderful and mysterious way everything will come out all right, without his having to exert himself.

Why is it that every industrialist uses the Bailey and Warren scientific method to solve his daily business problems, and like Rockefeller refuses to try to fool himself about his customers and his competitors—and then turns to the use of the lazy "human nature" method of trying to fool himself when he faces danger from Communism,

Socialism and the New Deal?

Ed, did you ever think over the close parallel between the aggression by negro slavery from 1800 to 1861, and aggression by Communism, Socialism and the New Deal from 1917 to 1951?

Democracy, Christianity and capitalism are doomed unless they can find the guts, the money, and the brains to fight Communism, Socialism, and the New Deal.

Your friend

Dan Dean, Nichols, N. Y.

—A.A.—

By enabling 15 per cent of our working force to produce our food and fiber (originally it was 85 per cent), farm mechanization has freed the man power needed to develop other phases of our society and economy—manufacturing, business, professions, transportation and service industries.

## A Helping Hand

Experience has a big hand in our work on Bell rural lines.

We call on it for steady improvement in service, as well as record-breaking construction.

It helps us develop telephone materials that work better and last longer, and equipment that makes the job go faster.

It's with our telephone crews in the field and

our operators at the switchboards; it's with all Bell telephone men and women whatever their job may be.

Experience watches over service every hour of the day and night and keeps it good.

It's important to you to have the hand of experience on the telephone job in rural America.

BELL TELEPHONE SYSTEM

# **No Calf, No Man and No Machine Can Do a Safe, Complete and Satisfactory Job of Milking Cows without TUG & PULL**

**with a Calf, it's  
INSTINCT**

**with a Man, it's  
HARD WORK**

# **with SURGE THE TUG & PULL IS BUILT-IN**

Today, thousands upon thousands of farmers milk their cows with Surge because they know that Genuine Surge Tug and Pull protects their cows, gets the milk, and saves time and work twice a day.

If you haven't discovered the important difference between Surge and ordinary machines, today—not tomorrow or the next day—is the time to call your Surge dealer and ask him to come out and demonstrate a SURGE in your barn.

# **Maryland Farmers Are On Their Toes!**

By JIM HALL

**M**ARYLAND farmers don't intend to get caught short by war conditions if they can help it. While visiting in that state a few weeks ago I rode over to Hagerstown in Washington County to attend a meeting of several hundred farmers, at which they faced squarely the problems they anticipated and took steps to avoid some of the difficulties of production they ran into in World War II.

They discussed such things as temporary silos, trench silos, and irrigation. But the real meat of the meeting came at two panels presented during the day. At the first one they discussed the effects of mobilization on farming, and had experts on hand to answer questions regarding manpower, machinery, fertilizer, marketing of agricultural products, and social security.

Boiling down all the remarks and conclusions Maryland farmers feel they can:

1. Look to housewives and city dwellers to help harvest crops because the number of migratory farm workers is down 20% due to the draft and increased employment in industry.
2. Look for continued growth in the demand for farm products.
3. Expect shortages of machinery, as manufacturers do not have a big stockpile of machines or parts as they did when World War II started.

### **Seek Information**

Maryland farmers believe in getting their information first-hand, so during the afternoon program eight farmers and nine representatives of manufacturers of farm equipment joined in an open discussion of new farm machinery, covering the most recent advances in design of existing equipment. Among things farmers found out in the course of this panel were:

1. None of the companies represented had hay crushers within the price range of farmers with small acreage. (Several of the companies pointed out there is a lot of difficulty getting volume and consequent low prices on special types of hay-making equipment, due to the fact there are so many ways of making hay. The volume of the machinery business has to be spread among several types of machinery as the companies are still making horse-drawn mowers and everything else in the haymaking line right through to the ultra modern hay-making equipment.)
2. Most of the companies are working on machinery for elevating silage, hay, etc., with motors of 5 horsepower and less, to save using big tractors for the job of blowing through conventional equipment. They are running into difficulty trying to design these elevators so that they will be portable.
3. Some companies have been working on such new things as a harvester or combine with baler attachment; combine corn pickers and shredders; and combinations of combines and field choppers in one piece of equipment.
4. Several of the manufacturers are designing equipment so that the farmer can use one motor unit on different machines where power requirements are similar.
5. Companies are experimenting with small power takeoff forage harvesters, small balers, small combines for 35 to 40 acres with an engine that can be used on other equipment, and larger hoppers on seeders, drills and planters for both seed and fertilizer.

The manufacturers' representatives pointed out that they have engineers working on machines that have never been built before, but it takes three years at least from the time the idea is put on the drawing board until the machine is in production. In the face of the present world situation and cutbacks in steel, most of them will not be able to put any new types of equipment on the market for several years.

Machinery men—and there were representatives there from Ford, International Harvester, Minneapolis Moline, John Deere, Ferguson, New Holland, J. I. Case, Allis-Chalmers, and Massey-Harris—all warned that there was apt to be a shortage of new machinery. They asked the farmers to bring their farm shops up to date in order to keep up with the maintenance of modern equipment, and pointed out that with proper maintenance a tractor would run eight or nine years without the need of being rebuilt.

The farmers present, in a formal resolution, asked all the machinery companies to allocate a good share of their steel and production to the manufacture of parts, and urged that they try to keep their dealers supplied with those that wear out the oftenest so that if ever they could not get new equipment they would be able to keep their old equipment running.

These Maryland men left the meeting knowing that the present national situation is keyed around six words:

1. "Inflation." Even Washington acknowledges there will be more.
2. "Taxes." Help control inflation. Expect more individual, excise, nuisance taxes.
3. "Production." Termed the best solution to marketing in wartime.
4. "Controls." Do not expect them to affect farm products for a while.
5. "Scarcity." Some scarcities already affecting farm operations.
6. "War." War turns everything upside down. Plans rapidly made and rapidly changed make good farm management more necessary than ever.

Russell W. Warner, whose 70 acres near Westminster, Md., is mostly devoted to dairy crops to feed his 23 milk cows and dry stock, starts 325 pullets and 75 cockerels each March. The New Hampshire pullets supply eggs for sale at the Westminster Cooperative egg auction every Saturday, and the cockerels supply the Warner family with the basic material for that famous Maryland Fried Chicken!

# ANTIBIOTICS

## in Poultry FEEDS

By  
LEE WEAVER

**P**ENICILLIN is an antibiotic. So also are streptomycin and aureomycin and several other "mycins." These substances are drugs that perform wonders in life-saving, in spite of the fact that the word "antibiotic" means, literally, life destroyer. There is a simple explanation to this seeming contradiction. Antibiotics save the lives of humans and livestock by destroying their bacterial and virus enemies. You pick up an infection. The doctor gives you a shot of penicillin which is immediately carried by the blood to the point of infection (the invaders may even be in the blood itself). Presto, you are feeling better, because the penicillin has killed off the foreign troublemakers.

What has all this to do with the feeding of chickens? It looks as though it will have a great deal to do with poultry feeds from now on because of a most astonishing discovery, one that is going to keep the research men busy for a long time, trying to find out how antibiotics do what they do to chickens when you put them in the chickens' feed. It is an unusually interesting story, so let's start at the beginning.

Vitamins, as every radio will tell you, are exceedingly necessary in the diet of each chick or child if it is to remain healthy and grow normally. The same is true of grown-ups, be they humans or cows or pigs or turkeys, as far as keeping well is concerned. Other essential items in a complete diet are proteins, minerals, water, and energy material, usually called carbohydrates. For years everyone has taken it for granted that these items are all there is to the diet. Probably everybody has been correct and still is, but because of this recent discovery some folks are doing some wondering.

### B12 Speeds Growth

The most recently discovered and synthesized member of the now numerous vitamin family is B12, originally known as the APF factor, or "Animal Protein Factor." They are now finding B12 in a number of materials that have no relation to animal protein, so the term APF is being discontinued.

Antibiotics are produced by certain types of molds. These molds are grown in great quantity by large biological supply firms. The molds, while they are

growing, manufacture antibiotics and also a rich supply of vitamin B12. So, almost as a matter of course, someone said, "Why not take this material after the antibiotic (penicillin or one of the "mycins") has been extracted, dry it and grind it up and use it in chicken feeds to supply vitamin B12? By salvaging this waste material, the cost of the drug can be reduced and perhaps the cost of poultry feeds, also." It was tried, and it worked. Then a mystery developed.

Feeds containing B12 from this new source made chicks grow faster than chicks fed feeds with B12 from other sources. When tried on young turkeys and young pigs, their growth rate was speeded up even more than in chickens. At first it was thought that there must be still another unknown vitamin present, but eventually it was proven beyond any doubt that it is the antibiotic itself that gives the added boost to the rate of growth.

### No Food Value

So now the scientists are puzzled. There is no food value in a drug. At least, none has been found in the past. It seems very unlikely, therefore, that an antibiotic in a poultry mash can be supplying any body-building material toward the growth of the chick. Why, then, does it make the chicks grow faster when it is in their feed? Before listing the guesses that have been made, it should be pointed out here that antibiotics are not the only drugs with growth-promoting action. Several drugs, designed for control of coccidiosis in chicks have, in addition, produced faster growth and more efficient use of feed than in control lots without these drugs. These gains do not equal those produced by antibiotics, but it is thought that they act in the same way.

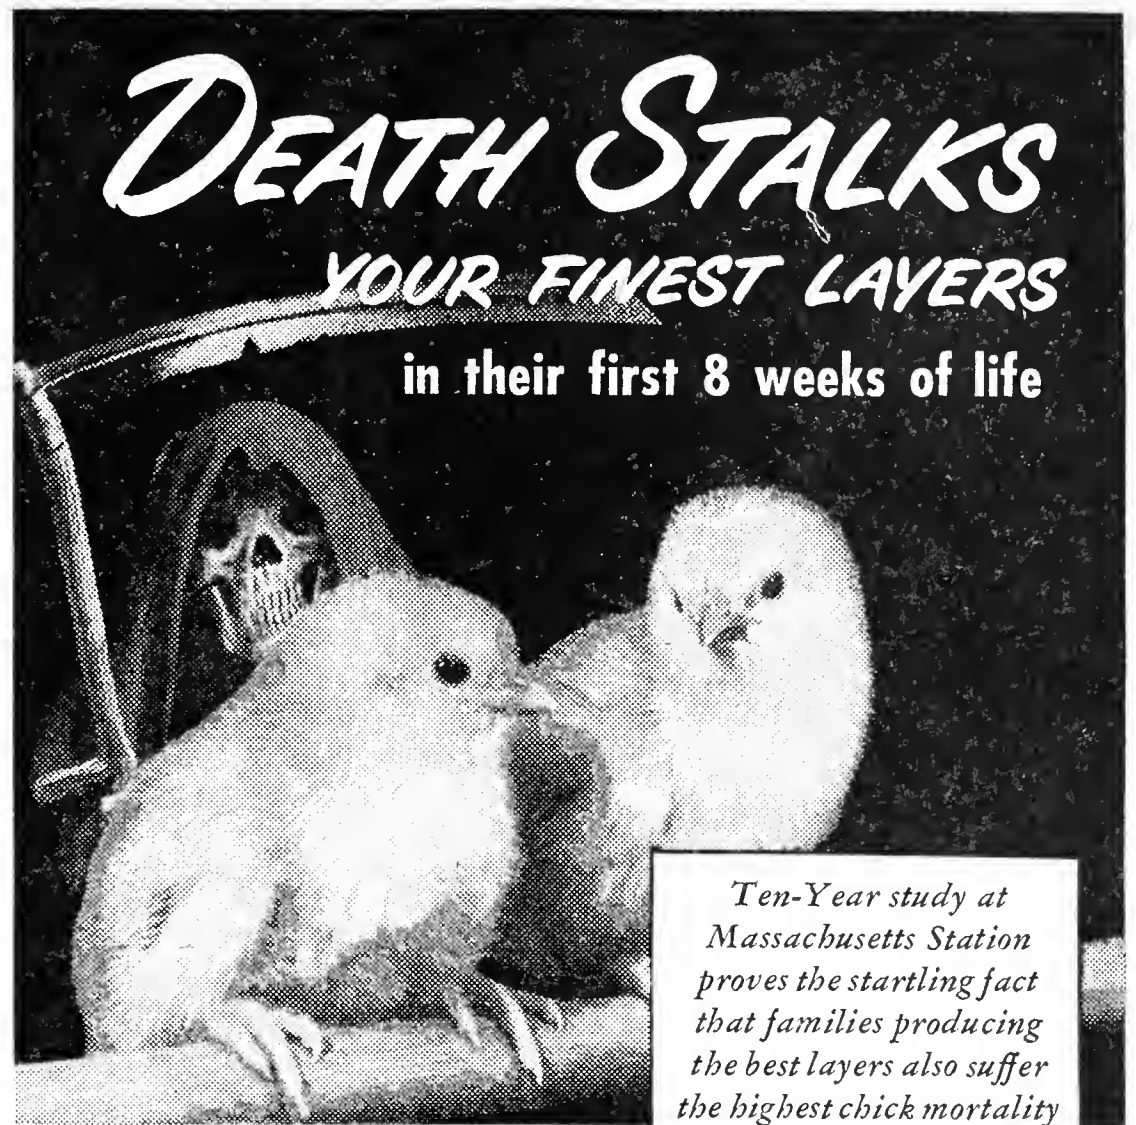

One theory that has been advanced to explain their growth-promoting action is that antibiotics stimulate beneficial bacteria which are in the intestinal tract, so that they speed up the manufacture of vitamins. Thus the action is indirect. Support for this theory is the fact that when increased amounts of known vitamins have been added to chick rations containing antibiotics,

(Continued on Page 31)

## DEATH STALKS

### YOUR FINEST LAYERS

in their first 8 weeks of life

Ten-Year study at Massachusetts Station proves the startling fact that families producing the best layers also suffer the highest chick mortality

## THAT'S WHY "Life-Span" Nutrition IS SO IMPORTANT!

As a 10-year Massachusetts Station study, on 297 families proves, it's the families that produce the best layers that suffer the most chick mortality.

And that's another reason why the "Life-Span" Nutrition purposely built into PRATTS CHICK STARTER is so important.

Here is starter so pure, so wholesome, so abundantly nutritious it can even cure many chick troubles that begin in the egg.

The USDA and most other stations have demonstrated again and again that chick mortality can be significantly influenced by the type of starter fed. So, simply by helping you raise

more of your best layers, PRATTS STARTER can pay for itself many times over.

But, the "Life-Span" Nutrition in this great feed does still more. It helps produce a *LIFE-TIME* of high profits! The 2 pounds of PRATTS STARTER you feed each chick favorably affects:

- Feed efficiency for the entire growing period.
- Time required to grow pullets to maturity.
- Body size ultimately attained, and
- Intensity of first-year egg production.

See your dealer today and ask for PRATTS STARTER.

The APF Factor—antibiotics—and all the other new discoveries are used in "Life-Span" Nutrition.

## A Bell Rings Out

By Paul Work

ONE of the fondest memories of my childhood is the sound of the church bell which came to our ears as our little party, walking three miles on a sunny Sabbath morning, came to the brink of the hill where we could look down on the little village of Lumber City, nestling on the banks of the Susquehanna's West Branch.

Churches have changed since then, with the coming of a new appreciation of the total needs of the rural community. New life has come as new methods have been tried out to draw the interest of the young people; to bring the church schools up to date; to link the whole program of the church to the interests of the farm, the family and the neighborhood; to put the teachings of the Lord Christ to work in every phase of rural life. This process is going on successfully, and one of the agencies that is helping is the Rural Church Institute, with headquarters in Barnes Hall on the Cornell University campus at Ithaca, New York.

### Church Extension

The Rural Church Institute through its directors, the Rev. Ralph Williamson and the Rev. Stanley Skinner, undertakes to do for country churches about what the state colleges do for farmers through the services of research, teaching and extension. It was founded by Hugh Moran, now retired, then Presbyterian student pastor at Cornell, and Mark Rich, then graduate student and pastor at Groton, now rural leader for the northern Baptists. Dr. Rich recently helped the Institute to celebrate its 15th anniversary at the annual meeting. John Wickham, Suffolk County farmer, was the lay speaker. He called for recognition of the changes that have taken place in farm life as in farm methods, and he suggested that the country churches have only scratched the surface of their possibilities.

One of the services of the Rural Church Institute is to help communities that are interested in the substitution of cooperation for competition among local churches. When its help is sought, its workers assist in such surveys as may be needed and in presenting possible plans as well as the experience of other groups.

### Initiative Gets Results

Those who travel Route 20 in New York State are familiar with the hamlet of Pompey Hill, high up on a ridge just south of Syracuse. Here two congregations, one Methodist, the other Presbyterian, formerly struggled to keep the lights burning. They have now federated and there is new life in the

parish. The pastor, Ellis Cowling, found a good pipe-organ in a private home in Syracuse. With the help of some of his flock, it was set up in the church. Mrs. Cowling plays and it has been a wonderful help in the worship services—and a pride to the community. The Lord's Acre Plan made it possible to buy a bus to bring children and parents to the services on Sunday mornings.

In the Groton area of Tompkins County and in Southern Cayuga the larger parish plan has been serving for years. The congregations retain their

### The New Rural Church Emerges from the Old

identity but work together in arranging for pastoral service and preaching, in united young people's work, and especially in providing week-day religious education and vacation bible schools to supplement the short time available on Sundays.

In some cases actual union has followed federation, as at Preble where Methodist and Presbyterian churches united as a Congregational church. Altogether, New York has about 165 parishes where some form of comity is in practice, a larger number than in any other state. Denominational officers and committees are in many cases cooperating wholeheartedly, feeling that the Kingdom comes before the sect and that the denominations gain by exchanging weak churches for strong and active ones.

### Training Young People

Were you to come to Ithaca, New York, on a Saturday afternoon, you would be likely to see one to several cars of Cornell University students setting off for a weekend of service and experience. Under the guidance of Director Ralph Williamson and Jean Whittet of Cornell United Religious Work, five teams are taking assignments to churches not too far away and each making four or five trips a season.

They go to a parish, visit in the afternoon, help stage a young people's party in the evening, assist with church school and the worship service in the morning and then return to their books. Thus these young collegians, mostly in agriculture or home economics, are learning things that will be priceless to them and to their communities after they graduate.

Associate Director Stanley Skinner of the Institute has given much time and travel this year to work with older

# Typewriter Farmers Annoy This Dairyman

— By Richard S. Overton —

Jefferson Co., N. Y., Dairyman.

**A**BOUT four years ago, I started dairy farming in Jefferson County, New York, leaving a fairly successful and promising business career. In retrospect, I am not entirely certain it was a wise move. However, it seemed like a good idea at the time.

It is apparently obligatory upon a person moving from city to farm to write a book or a series of articles. The theme is generally the same: Upon arriving at his newly purchased farm—generally a family possession—the urbane observer with horror, but not trepidation, the erosion and generally rundown condition of the mistreated acres now under his care. Fortunately, he possesses the knowledge to correct the errors of his predecessors. His neighbors, at first sympathetic, grow angry at his innovations. He, undaunted, forges ahead with his carefully laid plan, and in due time his barren acres become a blossoming Eden. His neighbors (whose lands and crops now suffer by comparison) realize their error in not immediately recognizing his superior knowledge and ability—and they now regard him as their benefactor, all but a few following his example.

At this point, the acres having been restored, the ex-urbanite places a deserving young man (who otherwise would never have had an opportunity in life) in charge of the farm and proceeds to write his books and articles. Copies of these will be avidly read by suburbanites, frustrated business executives and apartment house dwellers. These people will draw the only conclusion possible—namely, that the poor benighted farmers in this fellow's neighborhood have been despoiling the land and living in poverty until this fellow came along and showed them how to attain the more abundant life.

After four years of dairying, I can only conclude that most such books and articles are written to obtain income with which to recoup losses in the farm venture. The building up of land and of a dairy herd is a complicated process requiring years—and the highly enthusiastic and popularized articles on revolutionary developments are, in my opinion, about 75% expert journalism.

Of course, my ideas as here expressed, are based only upon observation locally and on such reading as a working farmer has time to do. Nevertheless, I have come to two conclusions about farming in the Northeast which I believe are basic and will bear discussion.

The first conclusion is that success in farming calls for about the same set of abilities required for success in other businesses. In general these are the abilities to:

1. Determine what it is you want to accomplish.
2. Find out what you have to do to accomplish it.
3. Find ways to do the things you have to do.
4. Do them.
5. Know when the things are done.
6. Determine whether or not you have accomplished what you set out to accomplish.
7. Be sufficiently flexible to change your objectives and methods to fit the environment in which you find yourself.

Unfortunately, some people have only ability number four—and they proceed to do a lot of things, try out a lot of new angles, and persist in a lot of old ones with no particular relation to any program which they are

trying to accomplish. Such people are further likely to muddle up their thinking with a lot of emotion so that their path is never quite clear.

The primary skills of farming (the amateurish performance of which provides considerable amusement to some farmers) are readily learned by any intelligent 12-year-old boy. They can be learned with equal ease by any intelligent 40-year-old man. They constitute an important part of working on a farm—but they have little to do with the intelligent exploitation of property for long-term profit.

And that leads to the second conclusion:

Farmers in this area do not give themselves credit for what they are. They are highly intelligent, successful and well disciplined businessmen and production engineers, and, as such, are worthy of their own self respect and the respect of their urban counterparts.

Unfortunately, some farmers regard themselves as "different." They are taciturn, defiant, abusive, self pitying—in fact everything but what their obvious capabilities should let them be. Most important, they collectively are obsessed with the idea that the rest of the people in the nation are out to take them for all they have.

There is no higher profession than agriculture. There is no economic function more basic. The president of a large corporation has less responsibility and less difficult decisions to make than the owner of a 200-acre dairy farm.

If the farmers of the Northeast would recognize themselves as being what they are, and act, live and speak out accordingly—and continue to grow and develop as any successful businessman must grow and develop—they would rapidly solve a great many of the problems which now perplex them; their communities would become live, interesting, attractive places, and they and their families would lead fuller lives.

— A. A. —

## DRYING OFF COWS

Occasionally we hear of a man who says he has a cow that can't be dried off. Certainly many cows will produce right up to freshening time unless particular attention is given to them, but it is doubtful that there is a cow that can't be dried off by proper procedure.

First, take all her grain away and feed her on dry hay and water. Milk her only when it is necessary to relieve her udder. You will find that the cow's udder can hold a considerable amount of milk without doing any damage. When you do milk her, milk her out thoroughly and if there is any mastitis apparent, milk her every day until this condition disappears.

With this treatment it shouldn't take long to dry off the most stubborn cow.

— A. A. —

## FORAGE HARVESTERS

There has been much recent interest in forage harvesters for grass. Certainly they have their good points, but let's not overlook the most efficient harvester of all—the dairy cow. Each cow can harvest from 100 to 150 pounds of grass a day, or up to 12 tons during the pasture season. While doing this she works for her board besides giving a good return to her owner in the form of milk.

But let's back up and make one point clear! A cow can harvest better than 100 pounds of grass a day on the right kind of pasture. Furnishing her this kind of pasture is one of the No. 1 jobs of good dairymen.

# Identical Twin Heifers used in Amazing Feed Test\* at DAWNWOOD FARMS

\*Test conducted under normal dairy farm conditions. Weights taken monthly by E. Van Steenburgh, D.H.I.A. supervisor.

We take pride in the calves we raise on our farms. That's why we created CAF-STAR. When the identical twin heifers, Candy and Sandy, were born, we made the famous feed test which proved that CAF-STAR helps develop bigger animals with better bone growth—and at a big saving. We feel that all dairymen should know about CAF-STAR.

Cordially,

*Dawnwood Farms*

Just mix CAF-STAR with water and feed quart for quart instead of milk. The 25-lb. package feeds a calf for one month at a cost of 16 cents per day.

Buy at your feed dealers in 25-lb. bags or 100-lb. (economy) bags. (Metal pails sometimes available.)

DAWNWOOD FARMS, AA-1, Arden, N. Y.

Dear Sir: Send me absolutely FREE:

1. Special chart for keeping my records of Calf Weight increases with Accepted Breed averages for comparison.
2. Special tape that tells the calf's weight by measuring the heart girth.

### WORKING UP WOODPILE SIMPLIFIED AT WAYSIDE FARM

GETTING in the wood supply at Wayside Farm in Hampton, New Hampshire, is not the prolonged process it once was. M. S. Holman, its owner, has simplified the task by designing a

wood carrier of second-hand lumber, which he attaches to his tractor shovel by means of chains through rings in the floor boards.

Lowering the carrier for convenience, Mr. Holman then splits the wood and tosses it in until full, when the carrier

is elevated and the load taken to the wood shed.

At least one handling is eliminated by this method, so that time and labor have been cut down considerably. The carrier may be removed easily when the shovel is needed for other work.

—D.D.H.

American Agriculturist, March 17, 1951

### HOW TO STAPLE FENCING

There are three sizes of fence staples—short, medium and long. When I go to the dealer, I always buy the long ones.

When I build a fence 20, 40, 60 or 80 rods long, I always stretch the whole length at one stretching, and when I drive the staples I never drive them in tight but leave from one-fourth to one-half inch out so the wire can give either way. With this method a snow bank at one end of a 40 rod fence can pull the wire down, and when the snow melts, the fence will stretch right back again. It can take up the slack out of the whole 40 rods; while if it is stapled tight to every post, it will break the wire or let it hang loose between the posts where the snow bank occurred or a cow reached through the fence. This goes for woven wire also. We have some fence which has not been re-stretched for ten years and it is still reasonably good.—I.W.D.

—A.A.—

### TIGHT GARBAGE PAIL

Here is a way to prevent dogs from getting in your garbage pail and strewing garbage all over the yard. First, bend down the center of the handle on the cover, then hook a screen door spring on the handle on one side of the pail; put it over the top of the cover in the depression in the handle, and hook it to the handle on the other side. If the spring is too long, tie a knot in it to make it shorter.—Ray Harrison, Dufur, Sask.

—A.A.—

### REPAIR PART NUMBERS

When you have a broken piece of machinery and want to get the serial number and it is where it is hard to read, just take a piece of modeling clay, soften it and press it against the serial plate. The clay takes a perfect impression of numbers without having to bother to take the machinery all apart. It saves a lot of time, especially if the bolts and nuts are rusted.—Mr. David Jerome, New Haven, Vermont.

## Farmers Can Pull Their Own Weight

(Continued from Page 8)

money out to farmers. The talk and publicity then swung to conservation for reasons which are obvious. In the quest to cut down production, there was a lot of talk about shifting from soil-depleting to soil-conserving crops to avoid shipping soil fertility to foreign countries. This argument went over big with a lot of non-farm people and some farm people.

Certainly lime and superphosphate are essential to good farming, especially the types of farming we have in New York State. Benefits from their use accrue largely to the user thereof in the form of better crops. Their use is primarily for soil enrichment rather than soil conservation. At one time the government actually gave lime to farmers and many of you will recall seeing piles of sacked lime standing unused around in fields. Remnants of those piles can still be found. While farmers now pay a substantial part of the cost of the lime and superphosphate they get through the government, the government is still making a very sizable contribution in addition to the cost of administration. For example, in 1949 the practice payment allowance to New York State together with the cost of administration amounted to \$6,153,000.

### Farmers Must Show Character

Conditions have changed a lot since the dark days of the '30's, and the board of directors of the New York State Farm Bureau Federation believe

that if farmers are ever going to be able to buy lime, superphosphate and such materials out of farm income, that time has arrived.

For many years we have contended that the government should not be the source of farm supplies, nor should it be the market for farm products. Such matters over the years can be worked out best through the normal channels of trade.

Certainly government has an important function in cooperating with farmers in helping to devise ways and means of improving practices both in production and marketing. It has an important function to perform in connection with the stabilization of the price level and the utilization of surpluses when they occur. The great research programs of the U. S. Department of Agriculture, Land Grant colleges and experiment stations have contributed greatly to the high standard of living of the American people.

The Farm Bureau Federation has launched no attack on the Department of Agriculture, the Production and Marketing Administration or any other agencies of the department. They are performing many useful services.

Perhaps the time may again arrive when government needs to help the farmer pay his fertilizer bill but we do not believe such need now exists.

If we are going to do something in this country about reducing non-essential government spending, we had better begin working at it today.

# A Bell Rings Out

(Continued from Page 18)

rural youth groups statewide, cooperating with Extension Service, Dairymen's League and other agencies.

One of the needs most commonly stressed is for better trained ministers for country churches. It is complained that seminaries are urban in outlook and subject matter, though many theological schools have become acutely aware of the need and are now making substantial provision for training that fits rural life.

Realizing the sacrifices—and the advantages—of a rural pastorate, many young seminarians are planning to live in the country. For these, Rural Church Institute offers, with the generous support of the Auburn-Union Seminary Board, a program of summer field training, a sort of internship. Last year sixteen young people were placed for thirteen weeks in parishes within sixty miles or so of Ithaca. They worked with the minister and the people, and they took courses in agriculture in Cornell's summer school.

## Many Workers

Country church people know about Rural Life Sunday, Harvest Festivals, and the Lord's Acre Plan. All of these are successfully promoted by Rural Church Institute. CROP, Heifers and Goats for Relief, and migrant work have all had active help from the Institute staff members. Contributions are made to several radio and TV programs, some now carried by local groups.

This is only part of the story. Who does all this, you ask? Just Director Ralph Williamson and Associate Director Stanley Skinner, with the faithful help of Mrs. Carrie Scheltz, office secretary. Both directors are experienced rural pastors, and they are sawing wood every day of the week. They see a lot more to saw, if only there were more than 24 hours in a day! They do have constantly increasing volunteer help from ministers and lay people all over the state.

The Institute serves as the rural department of the New York State Council

of Churches and works closely with county councils where they exist. It is a membership body, enrolling nearly 400 at present. We think it would be larger if more people knew about it.

## Farm Groups Interested

One of the most encouraging features of Rural Church Institute growth has been the increasing interest and support of the leaders and members of farm organizations. On the Board of Directors are Jacob Pratt, of "Milk for Health"; L. L. Bruce and Genevieve Judy of the Dairymen's League; Henry Sherwood of the Grange; Ted Clausen and Paul Taber of G.L.F.; Fred Morris and L. D. Kelsey of the Extension Service; Mrs. Florence Potter of the Home Bureau; Miss Evelyn Hodgdon of Oneonta Teachers College, and so on.

The Grange, Home Bureau and 4-H Clubs have given wonderful support, especially in setting up union community observances of Rural Life Sunday. The College of Agriculture at Cornell has been unstinting in lending its teaching and other services, as for the Town and Country Summer School.

And who provides the money for this good work? The budget for 1951 is about \$16,500, as much as is raised by three moderately strong rural churches. The New York State Council of Churches meets about a quarter of the cost; the Auburn Seminary Board takes care of the summer project for theologs. A small amount comes from denominational agencies. Most of the rest is from personal gifts and memberships and from Rural Life Sunday and Harvest Festival observances. Though the load is not very big for a state like New York, it is quite a job to come out in the black each year.

The present task is to acquaint more people with the significance of the spiritual values in rural life. This done, there will be little question about the support of our country churches, their valiant ministers and their wives and children, and of the other agencies that are working to the same consecrated ends.

## LIKES MODERN EQUIPMENT

O. D. DUDLEY of Meridian in Cayuga County, New York, and his son, Edwin, had their dairy barn equipped just the way they wanted it when I called there one morning last summer. Within the year they had remodeled the barn for their 26 head of Holstein and Guernsey milkers and had installed 26 tie-stalls and a barn cleaner.

Mr. Dudley was especially proud of the efficiency of the barn cleaner, which in 7 to 9 minutes did a cleaning job that for years had taken a good hour morning and night.

On their 100 acres the Dudleys grow, in addition to their silage corn and hay, enough corn and oats to mix 50-50 with a 32 per cent supplement for

grain feed. Mr. Dudley, who said he has been taking AMERICAN AGRICULTURIST all of his 63 years and his Dad had taken it before he was born, likes to keep up with new efficiencies in farming and puts them into practice in his own fields. For instance, in his corn he cultivates only once and then sprays with 2,4-D, which gives him the weed control he needs. However, he has not yet found anything to control wild geese. Last spring they completely cleaned out one 6-acre patch in one morning, and the whole thing had to be replanted the first week in June.

The Dudleys raise their own heifers, using both their own bull and artificial breeding. In the spring flush last year they were getting 1,000 pounds of milk a day from 24 cows, with one of the grades going as high as 75 pounds a day on 2x milking.

Another Dudley boy, Robert, just set himself up in the dairy business about two years ago on a 300-acre farm near his Dad's.—Jim Hall.

O. D. Dudley, who with his son, Edwin, operates a 100-acre dairy farm at Meridian, New York, demonstrates the latest method of cleaning gutters. A flick of his finger and the automatic cleaner does the job in 7 to 9 minutes.

# LONG "50"

## Automatic Pick-Up HAY BALER

## A NEW BALING PRINCIPLE!

The LONG "50" brings you a new principle in automatic hay baling — the automatic bale tension bar. This new principle eliminates the need for constant re-adjustment of bale tension due to wet or green hay. Square, compact bales every time, too!

You can save time, work, and money with a LONG "50". Fewer moving parts assure a long life with low up-keep costs. Simple, efficient operation means a good job done in less time.

On large and small farms, or for custom baling, the LONG "50" means a profitable operation season after season. Tested and proven in fields across the nation!

**FREE**

Colorful booklet, describing the many other superior features of the LONG "50", and the name of your local dealer. WRITE postcard or letter TODAY!

**LONG Manufacturing Company, Inc.**  
TARBORO, NORTH CAROLINA

## Help Yourself to Healthy Herds

**CALF-KIT** One pound of Peebles Calf-Kit replaces 8 lbs. of milk, contains 98% milk serum solids, vitamin-fortified to raise big, thrifty calves. Saves you money, lets you sell your milk.

**MASTITIS CONTROL** Use Penstix and Penstix-SM bougies for prevention and local treatment of this destructive disease. Effective, easy to use, individually wrapped in sanitary envelope. 24-page booklet tells full story.

**MILK ROOM HEATERS** Safe, low-cost heat and circulation saves labor and makes dairy work easier. Electromode all-electric heater has thermostat, lifetime heating element. Simple installation. Will heat average milk house entire season for as little as \$14.46.

**BARN VENTILATORS** Fan-Pac ventilators safeguard cattle health, preserve buildings and increase milk production. Dependable unit comes ready to install, has 2-speed thermostatic control. Operates economically. Underwriters approved.

## USE THIS Easy Way TO FARM PROFITS

Our big line of labor-saving, profit-building farm equipment can help you make more money from your farming operations. Our free cata-

log lists hundreds of products made by dependable manufacturers. Write for it today. Folders on above items also available.

W. M. LEWIS, President

Box 10

Ipswich, Massachusetts

Norman Goodwin's sister-in-law, Sally Goodwin of Norway, Maine, lends a hand when it comes time to pack the cheese into waxed boxes.

## A Young Cheese Maker

By  
HARRY A. PACKARD

**E**X-GI Norman Goodwin of Norway, Maine, is gaining fame by his method of converting skim milk into cheese. His cheese commands customers for more than 300 pounds a week, and although he isn't telling all the secrets of his success, his name for his cheese gives away one of them. He calls it "Creamed Cottage Cheese," and admits that he uses upwards of 2 quarts of heavy cream to 100 pounds of the cheese.

By experiment, Norman found that whole milk did not work well in this kind of cheese, but that the adding of cream gave it a fine flavor. He says that melted butter, in addition to the cream, also imparts a fine flavor.

There are a number of names by which skim milk cheese is known—cottage cheese, curd cheese, sour milk cheese, etc. The other day an elderly lady christened Norman's cheese, "Pot cheese." It seems that the early settlers always had a pot of it handy to team up with their helpings of hot apple pie.

Probably the first people to make skim milk cheese in this area were the German housewives who were among the early settlers. What surplus milk they could keep away from the calves

was set in pans or shallow dishes in a warm place, usually on the back of the stove, and permitted to sour and ripen by natural processes. Norman employs a modern culture method, and prefers the long aging of some 15 hours to the shorter method which requires only about a third as long.

"It doesn't pay to hurry the ripening and souring process," he says.

### Another Secret

One of his secrets is the sparing use of salt. He learned this from a Mrs. Karl Schenk who made similar cheese many years ago. She always insisted, he says, that too much salt on food, whether in making cheese, pickles, or sauerkraut, destroyed the good flavor and imparted a bitter taste.

After the skim milk has been soured and ripened fully 15 hours, the 100 pounds of curd—which is made in a special stainless steel tank—is permitted to dry out for several hours. Working the white curds over with a paddle or a wooden scoop helps to remove more of the liquid. Then the salt is added and stirred or worked thoroughly into the curds. Cream is then added, and the cheese packed into waxed containers, ready for the customers.

No wonder that Norman Goodwin's Creamed Cottage Cheese is popular with his customers! He adds heavy cream—2 quarts of it to 100 pounds of cheese—to get that fine flavor which keeps customers coming back for more. The cream is added last, after the salt has been worked in.

## Peach Men Expect Good Crop --Tomato Co-op Studies Prices

By L. B. SKEFFINGTON

**D**AN DALRYMPLE of Lockport is the new president of the New York State Peach Growers' Association, succeeding Donald Nesbit of Albion. Reports from the counties at the annual meeting indicated there had been no winter damage and that, barring later damaging freezes, a good-sized crop is on the way.

In contrast, reports from other states indicate a light crop. Through Ohio, Indiana and Illinois buds are reported damaged and the Pacific Northwest still is suffering from winter damage to trees a year ago.

### Winning Family

For 24 years Art Wager has been clerk of the potato show at the annual Steuben County Potato Convention. Because of his official position he never felt that he should have an entry of his own—until this year. He was declared grand champion.

"I just thought I would try an exhibit for once," he said. It may be that the stuff of champions runs in the family. His nephew, Charles Stone, also of Cohocton, was declared top winner in the 4-H exhibits by growers under 16.

### Milk Rationing?

Dr. Charles J. Blanford, administrator of the metropolitan New York milk marketing area, told the annual meeting of the Rochester Cooperative Milk Producers' Bargaining Agency that milk rationing is possible. He said production of milk cannot be increased very much in a short time and that set-asides of milk may be necessary to provide for manufactured products.

Blanford said that on an all-out basis this country could up its total productive capacity two and one-half times, but that the dairy industry is held back by three limiting factors. These he listed as the biological nature of the industry, manpower and facilities. He said that if milk production was stepped up 10 per cent it would equal the gains of the past dozen years. "The nation may have to choose between a guns or butter economy," he said, "and when that choice is made we may find that we do not have enough milk."

### Tomato Prices

Up to this writing the New York State Canning Crops Growers' Cooperative has not announced prices it will approve for tomatoes. Unofficially, it is indicated that there is strong sentiment for \$40 per ton for Number 1 Grade and around \$30 for Number 2s. At contract prices of \$28 and \$18 last year, a number of growers say they got an average return of about \$23.

The BAE has announced that the parity price of tomatoes for processing is \$31.50, and that this would be the minimum if any ceilings are set. The USDA has suggested that acreage of tomatoes for processing be increased 35 per cent this year. Many growers are pessimistic about this goal being reached. They point out that even with a substantial price increase the big headache will be obtaining enough labor at picking time.

### Even Milk Pricing

After being kicked around for several years, there seems to be strong sentiment among dairy leaders for the so-called Louisville plan of pricing milk to farmers. The Legislature is expected to enact a bill which would clarify power of market administrators to withhold money from producers' checks. Under the plan, 20 or 30 cents would be deducted from the price of each 100

pounds of milk marketed in May and June. The money would be put back in the pool and prorated on October and November deliveries.

The Class 1 price in Rochester and Buffalo markets is \$5.80 until May 1. Producers figure that normally it would drop to \$5.40 then and that if costs keep going up they may have to ask for \$6.20 next fall. These price changes, with frequent resulting changes in retail prices, are confusing to consumers. One dairy leader said "they forget price cuts and protest about restorations." Under the Louisville plan there would be no change in the price dealers would pay in the spring and money held out would come back to producers in the fall. Such a plan also encourages more fall production.

\* \* \*

### Michigan Grapes Out

E. A. Beers of Lakemont told a five-county grape growers' meeting at Penn Yan that a first-hand survey confirmed that the Michigan grape crop was ruined by freezing this year. He said county agents are advising vineyardists to prune their vines for the 1952 crop.

— A.A. —

### DEALER SHOWS

Farm machinery and implement dealers across the Northeast are sponsoring shows and meetings to give prospective buyers a preview of the equipment that is going to be available.

Typical of these dealer-sponsored farmer meetings was one held at Dryden, New York, late in February by Russell Marion, John Deere dealer in that area. Several hundred farmers and, in many cases their families, gathered at Marion's big show room for lunch, to look over equipment in stock and to view several movies. The movies demonstrated modern farming methods and one was devoted entirely to farm safety.

— A.A. —

### WOMEN'S PROGRAM MARCH 20-23 AT FARM, HOME WEEK

**T**HE women's program at this year's Cornell Farm and Home Week, March 19-23, at Ithaca, N. Y., will start on the second day, March 20, one day after the men get going. There'll be four full days of exhibits, lectures and demonstrations, with topics including:

Weight control; simplification of kitchen work; how to freeze pork; children's behavior; family life; laundry problems; quantity food preparation; cane seated chairs; children's books; wool fabrics; textile stenciling; drying clothes; food freezing and preparation; colorful meals; care of feet; new styles in hair arrangements, and housing for health and safety. There'll also be a free nutrition clinic; an evening sacred concert; bird lectures with sound recordings, and travel talks and singing.

A very interesting feature this year will be a rural art exhibit and movies in the Seminar room on the fourth floor of the Plant Science Building. About 25 paintings by rural people who have had no formal art school training will be shown; also, some of Grandma Moses' paintings. Three movies will be shown every morning at 11 o'clock, including "Grandma Moses at Work" and "Keyed Color." The object of the exhibit is to encourage people who are interested in painting to have fun working by themselves if they cannot get outside help. Helpful books on sketching, drawing, and painting will be part of the exhibit.

# Apples for Stock Feed

By E. STUART HUBBARD

WHAT is the dollar and cents value of apples as feed for farm animals? What is their value as a catalyst in making minerals and proteins more readily available for animals? What is their value as an inhibitor in preventing disease? Are apples and other feeds higher in these values when grown on soil high in rich organic matter, including animal manure, limestone and rock phosphate? Is it safe to feed apples to milch cows?

The first three questions are being scientifically investigated by the National Apple Institute and leading nutritionists for both humans and animals. The other two are under observation in many farm herds.

These questions concerning animals were suggested by the splendid results I have had in wintering dairy heifers and several cows on high grade roughage with apples in place of silage or roots. As our top soil became deeper and more highly organic with the use of limestone, rock phosphate, poultry and stable manure and mixed legumes and deep rooted grasses the quality, vigor and amiability of the animals improved so that they are said by those who know to be outstanding in these qualities and in ease in getting the heifers bred by our young bulls similarly fed.

## Find Apples Safe

Many dairymen are finding apples not only safe feed but a valuable substitute or supplement for silage. Ralph Smith of Poughkeepsie feeds the sortings from his orchards to his top bracket producing herd of Holsteins, starting in the fall and continuing until the apple storage is empty in May. He is feeding  $\frac{1}{2}$  bu. per cow and is able to delay opening his silo until the cows are off pasture. Less silage is fed when apples are fed. He cuts the apples with a root cutter.

Carl Wooster of Union Hill says that he has fed a bushel a day per cow to his famous herd when apples were surplus, with fine results. Other dairymen give similar favorable reports on feeding apples and apple pomace.

When visiting the ranch of a prominent Californian, Truman Nold of the National Apple Institute was asked by his host to admire his Shorthorn herd. "These animals," he said, "are no better than others in the show but I will win first prize." "Why?" asked Nold. "Because I fed them apples." "How come?" asked Nold. "Well, we grow apples. I started feeding them to my stock and found that they developed a finer finish. It is this superb condition that has made my animals consistent winners."

We, also, have found that our heifers

and cows seem to glow with health and well being on an apple supplemented diet of roughage in an open front pen stable.

One dairyman says apple pomace is a good feed for his cows. He has used it from a pile three years old with good results. Some cider mills consider it a favor to them for farmers to come and take the pomace away so they do not have to cart it and dump it.

Some farmers fear to use apples to feed cows because of an old saying that apples will dry up cows. This is undoubtedly due to the effect of cows overeating apples when turned into orchards where they can gorge themselves. As part of a balanced ration, apples are demonstrating their value. Our scientists will soon be able to tell us why.

— A.A. —

## Better Roughage for Lower Costs

MORE and more emphasis is being given by many different authorities to the need of feeding dairy cows more high quality roughage in order to reduce the grain bill. Dr. Ralph E. Hodgson of the USDA Bureau of Dairy Industry, recently said that the average increase in milk production during the past few years, the nation over, was due largely to increased grain feeding and not to the pasture and roughage part of the feed supply. Therefore, this increased milk production is produced at higher cost than it would be if better roughage and pastures were used.

Dr. Hodgson also believes that if cows had the opportunity, they would consume many more nutrients in the form of roughage such as pasture, hay, and silage, and furthermore, they would produce just as much milk as they would if less good roughage and more grain were fed.

At Beltsville, Maryland, Bureau of Dairy Industry scientists were able to save 86 per cent of the dry matter and 83 per cent of the protein in the alfalfa crop by putting it in the silo. Where alfalfa had been rained on and cured in the field, they saved only 60 per cent of the dry matter and 49 per cent of the protein.

The saving in protein per acre, per cutting, when the alfalfa was made into silage instead of hay, was equal to about 200 pounds of soybean meal. When the hay was damaged by rain, the saving in protein was equal to about 400 pounds of soybean meal.

"This is a very significant saving in protein, which otherwise might have to be provided as purchased protein-rich supplement," Dr. Hodgson said.

Born without a tail, this calf belonged to Mr. Sylvester Tincknell, R. D. No. 4, Auburn, Cayuga, New York. This Guernsey calf has a half sister with a deformed tail. However, Dr. F. B. Hutt, geneticist at Cornell, does not believe that it is an inherited characteristic. The half sister freshened last summer and is a good producer, as is her dam.

Montgomery Worsted Mills, Inc.,  
Montgomery, Orange County, New York

**MORE EGGS!**

**FREE!**  
This booklet shows how to build modern, improved-type poultry houses for all climates. Shows structural details.

Housing your hens in a comfortable, sanitary, rat-proof concrete poultry house is a good way to insure bigger egg production. When built of concrete a poultry house will last a lifetime and its modest first cost will be practically the last.

Long-lasting concrete is the thrifty material for feeding floors, dairy barn floors, milk houses, foundations, grain storages, manure pits, water tanks—improvements that help you raise more needed foodstuffs.

Send today for "how to build" booklets. If you need help, get in touch with your concrete contractor or building material dealer.

# Alaska Summer Tour

**AUG.**  
**1-26**

**YELLOWSTONE • MT. RAINIER • ALASKAN CRUISE  
LAKE LOUISE • BANFF**

FOR many years, the people who have gone on our AMERICAN AGRICULTURIST winter tours have said, "These winter trips are wonderful, but why don't you have a summer tour, too, and go to Alaska?" So here it is, folks—the trip of a lifetime, the best one we have ever planned (and that's saying a lot, as anyone who has gone on our tours would tell you!)

The tour dates are August 1 to 26, and Mr. Verne BeDell, our well-known and popular tour leader, has planned the very best and most comprehensive Alaskan cruise possible, with visits to other celebrated places, including Yellowstone National Park, Mt. Rainier, Seattle, Victoria, Vancouver, Lake Louise, and Banff.

Best of all will be a glorious ten-day cruise in a beautiful modern ship to the Land of the Midnight Sun. As the ship threads its way among the thousands

of islands en route to Alaska, you catch your breath at every turn, awed by the overpowering majesty of the mountains, towering up and sweeping down to the very water's edge.

Our ship, the S. S. Chilcotin, specializes in comfort, hospitality and entertainment for guests. It has all outside staterooms, excellent beds, running hot and cold water in all rooms, exquisitely furnished lounges and dining room, spacious decks where you can sit and watch the scenery go by or take part in deck games.

## Northern Wonderland

While in Alaska, we'll visit Ketchikan, Juneau, the capital of Alaska, and Skagway, where we'll see places made famous in early Klondike days. From Skagway we'll take a trip you'll talk about the rest of your life. Aboard a narrow gauge railway train, we'll follow the Trail of '98 to Lake Bennett, and then go to Ben-My-Chree, into a world of encircling mountains, mantling glaciers, and vividly colored flowers.

On our way West, we'll spend three whole days in Yellowstone Park, where we'll see strange and curious things and astonishing sights: Old Faithful geyser throwing a column of steam and water 150 to 180 feet into the air every hour; the beautiful Grand Canyon of the Yellowstone, with its marvelous coloring and gorgeous waterfalls; scenic Cody Road, the paint pots, petrified trees, and ghostly geysers.

The train trip across the continent, aboard the Northern Pacific's crack train, the "North Coast Limited," famous for comfort, high standard of service, and delicious meals, will be one of the highlights of the trip. On reaching Seattle, we'll go to beautiful Mt. Rainier, where we'll have lunch and dinner at Paradise Inn. At Paradise Inn you'll find over 500 varieties of flowers, roaring mountain streams, thundering waterfalls, towering evergreen forests, and Mt. Rainier with its mighty moving glaciers.

On our return to Seattle, we'll board the S. S. Chinook for a restful overnight ride on calm waters from there to Victoria, Canada, a city famed for

its beauty and old English atmosphere. We'll have a sightseeing trip around the city, and lunch at the luxurious Empress Hotel; then back to our ship for a 4-hour cruise among picturesque islands to Vancouver. There we'll board our Alaska cruise ship—the S. S. Chilcotin—our home for the next ten days.

On seven of the ten days aboard the S. S. Chilcotin, we will call at Alaskan and Canadian ports and go ashore—sometimes for a few hours, and once for overnight. Every moment will be filled with interest and happiness as we visit this northern wonderland, with its souvenirs of gold-digging days, majestic scenery, vivid flowers, and long, long days of sunshine.

## A Time of Enchantment

After Alaska will come another marvelous experience. We will go by train from Vancouver to Field, Canada, and then motor to Emerald Lake through a region of lofty peaks, canyons, glaciers and forests—scene after scene of matchless beauty. We'll visit celebrated Lake Louise, set like a precious gem midst towering peaks. We'll spend two enchanted days and nights at the lovely Chateau Lake Louise, and will motor from there to the amazing Columbia Icefield. Then on to Banff, where we'll stay at the magnificent Banff Springs Hotel.

The cost of this trip is very reasonable in view of the absolutely perfect boat, train and hotel accommodations, the delicious meals, the expert escort service, and the opportunity to see so many celebrated places. The "all-expense" ticket includes everything except such personal expenditures as souvenirs and laundry. Our only regret is that we must limit the party to 93 persons. We could not secure accommodations for more on the S. S. Chilcotin.

If you have made one of our trips, escorted by Verne BeDell, you know how enjoyable and perfectly planned they are. If this is your first one, you have a new experience awaiting you. You'll find it the trip of a lifetime; a carefree, restful vacation filled with delightful surprises and good times in company with the nicest folks in the world. You'll have absolutely no travel

worries; no tickets or luggage to carry, no tips to pay, nothing to do but to enjoy every moment of it.

To get a copy of our illustrated itinerary, fill out the coupon below and mail it to E. R. Eastman, AMERICAN AGRICULTURIST, Box 367-T, Ithaca, N. Y. This Alaska Tour is sure to be a sell-out—so don't delay, or you will be disappointed in getting a reservation.

**E. R. Eastman**

▲ The trip to Paradise Inn on the slopes of majestic Mt. Rainier, where flowers and glaciers meet, is the greatest scenic attraction in the entire Pacific Northwest.

Travelers agree that the Alaskan cruise on the calm blue waters of the Inside Passage, midst spectacular scenery, is the last word in pleasurable, memorable vacation travel.

▲ Magnificent Chateau Lake Louise where we'll spend two enchanted days and nights. Thrilling scenery, cosmopolitan comfort and delicious meals have made it famous the world over.

The amusing antics of the roadside bears are one of the delights of Yellowstone Park.

Nature outdid herself in the Canadian Rockies, as you'll agree when you see the surpassing beauty of Lake Louise's jade green waters, bordered by vivid poppies and framed with towering, snow-clad peaks. We'll have an unexcelled view of the lake from Chateau Lake Louise. From there we'll motor over a scenic highway to the luxurious Banff Springs Hotel, just 40 miles away.

DIRECTOR, RESEARCH DEPT.

## Well-Grown Pullets Lay Well

Early last spring a brood of cross breeds was started at the Research Farm. Our poultry breeding work is restricted to 3 standard breeds, but because of widespread interest in them the crossbred chicks were secured. They were managed and fed according to our program where feeds are not under test. Now that the pullets have been in production several months a summary of our records should be of interest:

Average weight at 6 weeks 1.35 lbs.  
Mortality to 6 weeks 1.80%  
Age when 1st egg was laid 18 weeks  
Production at 20 weeks 11.7%  
Production at 24 weeks 53.4%  
Production at 28 weeks 71.5%

Our research work prohibits culling, since removal of birds would nullify other phases of the experiment. This was not an attempt to prove superiority of one line of breeding over another, but it does show that birds bred for eggs lay well when properly grown.

Without benefits of culling production at 24 weeks of age averaged 53.4%.

## 226 Turkey Eggs in 323 Days

Turkey breeder hen No. 4893 laid 226 eggs from Oct. 13, 1949, to Sept. 2, 1950. Thirty-two of the 193 eggs set were infertile, but 147 poults, or 91.3% of the fertile eggs hatched. This again proves that high hatchability of fertile eggs can be obtained from a high producer provided she is well fed and cared for.

## A Good Cow Starts as a Calf

CALF raising at Willowbrook Ayrshire Farm, Cortland, New York, is considered the backbone of their dairy operations. Calf raising is planned to give maximum results at minimum cost. The records show this program has paid off, too. This herd has been among the top 10 Ayrshire herds for the past ten years. Production and butterfat records shown for the last five years help illustrate this point:

Year	Average Production per Cow (Lbs. Milk)	Average Lbs. Butterfat per Cow
1945	10,450 lbs.	446 lbs.
1946	10,906 lbs.	463 lbs.
1947	10,921 lbs.	488 lbs.
1948	11,405 lbs.	495 lbs.
1949	11,301 lbs.	482 lbs.

Willard Walker, farm manager, credits their calf raising and heifer growing programs as primary reasons why the herd has stood out so year after year.

Here's the way they do it at Willowbrook Ayrshire Farm:

1. Calves are taken from their mothers after 12 hours, but are kept on colostrum milk for 3 days. Mr. Walker believes cows come to their milk quicker when calves are taken away at 12 hours.

2. During the first month, calves are fed only a limited amount of milk along with Purina Calf Startena. They also get water and block salt but no hay.

3. No milk is fed after 1 month. Mr. Walker says: "I've learned calves grown on Calf Startena are bigger and better than those grown on milk. Besides, it costs only

about half as much to grow them this way."

4. After 2 months, calves are fed good quality hay. However, they are kept entirely off pasture

8 months old heifer weighing 568 lbs. 10 replacements like her per year are ample for their herd maintenance.

until at least 4 months old. Calf Startena is before them at all times.

5. After 4 months each heifer gets 3 lbs. of D & F Chow daily, plus all the good hay and pasture she wants. 90 days before freshening the amount of D & F Chow fed is increased.

Of course Mr. Walker does not give the calves and heifers all his attention. Consistent production averaging more than 10,000 pounds of milk per cow reflects many factors of good management, such as the conditioning of cows while dry and the careful feeding of the milkers. His pasture improvement program has been so effective this herd showed no slump even through the severe drought of the 1949 summer. Even when pasture is at its best the animals in this herd have choice hay within easy reach.

Tottie Girl is classified excellent. Her production each year has been in excess of 10,000 lbs. of milk. Tottie's daughters are setting even higher records.

# PURINA CHECKERBOARD NEWS

## It Took 1028 Tests But We're Getting Bigger Chicks, Pullets

Miracle growth promoters combined into Formula "1028" now added to Purina Startena and Growing Chow

Discussions dealing with miracle growth promoters described as Antibiotics, Vitamin B<sub>12</sub> Supplement (formerly APF), and Growth Vitamins are confusing. Only highly trained research scientists can understand much about them. Yet, your chicks, pullets, poults, broilers, pigs, etc., can't make maximum growth without them.

Now, after a total of 1028 feeding tests in Purina Laboratories and at the Purina Research Farm a new combination, "Formula 1028" for poultry is perfected. 571 tests resulted in a perfected formula for poults. Still other tests conducted in similar detail resulted in special formulas for pigs, for growing pullets, and for broilers.

The Antibiotics, Vitamin B<sub>12</sub> Supplement and Growth Vitamins are very complex in their action. Chicks respond best to one combination; poults to another; pigs to another, etc..

Whis Millhollen makes thousands of individual weighings in conducting these tests

The illustration shows growth contrast on poults resulting from the new formulas perfected through 571 poult feeding tests. Growth results on the new formulas for chicks, pullets, broilers and pigs are similarly startling.

Without Purina's background of knowledge gained from these

feeding tests, mistakes might easily have been made that would be costly to our feeders.

★ ★ ★ ★

Your Purina dealer will be showing a film that tells an exciting story about Formula "1028." Ask him for an invitation.

## POULT RAISING HINTS...

By HOLLIS H. BROWER  
Purina Turkey Field Specialist

Your hopes are pinned on a profit from every poult, but profit chances die with the loss of each poult.

**Don't give disease a chance.** Be ready when your poults come.

Scrape and sweep brooder house and equipment clean, then scrub with Purina Disinfectant. Wait 'til house is dry before poults go in.

**Don't guess about the heat.** Hang up a thermometer and make sure

the temperature is 90°-95° at first. Lower 5° per week. Too much heat is as dangerous as too little.

**Give 'em fresh air.** As birds grow, open the house for ventilation. Open windows or vents on one side, but avoid floor drafts. It's necessary to let excess heat out and to let fresh air in.

## HOME HANDIES

Keep an extra pair of clean cotton work gloves near your freezer to save your hands when taking foods out, rearranging, or putting foods in the deep freeze.

It's easy to do a professional pressing job if you remember that pressing means setting the iron down and lifting it up, never moving it to and fro across the material.

Here's an unusual—and welcome—way to wrap your gift for a baby shower. Instead of paper, wrap the gift in a diaper, fasten it with safety pins, and decorate it with a tiny rattle.

## EGG FUTURE LOOKS BRIGHT FOR 1951...

A looming egg shortage points to exceptional profit opportunity for those whose birds are ready.

Government figures released December 1 showed the following startling situation:

**1. Only 58,000 cases** of shell eggs in storage as against 250,000 cases on hand one year ago. This was the smallest number of eggs in storage since 1916. Average for the past 5 years was 710,000 cases.

**2. 18,000,000 fewer layers** than a year ago. There were only 438 million hens and pullets (potential layers) on farms as against 456 millions last year, and a 5 year average of 466 millions.

**3. Eggs at their peak** in December brought 22.4 cents more per dozen than at their low point in May.

**4. The gain in price** from low in the spring to high in the fall has never been less than 10 cents per dozen. Usually it is much more.

Instead of worrying about what eggs will bring next fall, wise poultrymen are ordering chicks for immediate delivery, and are making plans to properly grow their pullets. They want to be ready with eggs to sell while prices are best.

# PURINA CHECKERBOARD NEWS

## "Gosh They're Big," Says Pennsylvania Grower...

DAVID SUSMAN, R. No. 4, Chambersburg, Pa., has been a grower for six years. He has built his operation to 14,000 birds raised yearly. "The most amazing thing to me is the way poult size and livability have increased in the past few years," he said last summer. "I never got such whoppers as these 10-week-old birds grown on Turkey Startena and Growena Checker-Etts."

Here's an example of the care Mr. Susman uses in getting this kind of results. He had his equipment all set to move out his first batch of 3,000 poults last spring. He walked out over the grass and found that some of it was moldy underneath, due to excessive rains.

"I took to the hills right now," he related. "Not a bird was moved out until the equipment was located on a dry spot without moldy grass."

Another thing that Susman watches closely is feed consumption. The minute they begin to droop or go off feed, he starts the two-day coccidiosis treatment. He uses Purina Sulfa-Nox and points out that when the treatment is started early, he seldom loses a poult.

"I did have a bit of tough luck on this group of birds," said Susman, referring to the ones pictured above. "Started 3,445 paid for, plus the extras. When they were 9 weeks old, I put out 3,415. The very next day a

David Susman with one of his 10-week-old toms. He believes in plenty of water. This range has five 100-gal. hog waterers with turkey grills.

twister and heavy rain storm came through and killed 31. That cut my livability on this bunch down to 98%!

"I've usually hit above 95% livability on all poults the last few years," he reported. "This I attribute to absolute cleanliness. I also found that birds start a little quicker on the Checker-

Ett form of feed, which probably cuts down my starvation losses."

David Susman markets all his birds dressed. Some are sold locally, but most go to New York to a certain buyer who pays a premium for Susman's birds.

"This commission man likes our clean dress," he explained.

"He also pays for our extra plump finish and color. I've found that Purina Growena to 16-18 weeks with Fatena from then to market puts on the finish that brings a premium. In fact, I'm dressing birds from neighboring farms now, and I insist on that Fatena finish so I can hold the extra price in New York."

Ready for a new batch. House and all equipment are disinfected. After poults are started, dirty litter is removed daily. Feeders and founts are cleaned and disinfected regularly. Brooder house was converted from an old barn.

Purina fieldman Bob Keith calls on David Susman every other week to check on troubles, bring local turkey information. He renders the same service for all his turkey customers, has done so for 10 years. Most Purina men offer same friendly help.

## CALAMITY CAL...

# PURINA CHECKERBOARD NEWS

## FAST GROWTH SAVES YOU MONEY

4½ WEEKS OLD  
weighs 1 lb.

1st lb. gain takes  
2 lbs. feed

9½ WEEKS OLD  
weighs 3 lbs.

3rd lb. gain takes  
4.2 lbs. feed

14 WEEKS OLD  
weighs 4 lbs.

4th lb. gain takes  
5.5 lbs. feed

Recently the men at the Purina Research Farm have been studying records on pounds of feed required to make a pound of gain on broilers. These figures back up the old story that the faster they grow, the less feed it takes to get them ready for market.

The pictures show how feed conversion slows down as birds get older. When you speed up growth, you get more weight gain in the early weeks when feed conversion is best. This saves you feed—as much as ¾ pounds per broiler—when you speed up growth one week.

## FARM HANDIES

Edgar S. Alderson, Kingman, Ind., installed a handy overflow funnel in the upper floor of his laying house. This way water used to wash fountains can be easily carried outside the building.

A gravity flow water tank is suspended in the barn loft. It is filled with an electrically operated pump.

This pig brooder, "home-made" by W. P. Moore, Higginsville, Mo., costs just a little over \$3. A light socket is fitted into the bottom of a metal can. The can is set down through a hole in the top of the triangular brooder and rests on hardware cloth nailed on the inside.

The Meyer hay conditioner manufactured by the Meyer Manufacturing Company of Morton, Ill. While the power mower is cutting the hay, the machine picks up the swath previously mowed and cracks and splits the stems, thereby cutting drying time by 30 to 50 per cent.

## A FORUM FOR Backyard Gardeners

I had a small piece of sweet corn in my garden last year, and it had a lot of smut on the ears. Is there anything that can be done to treat it?

Unfortunately, there isn't much that can be done to control smut. One thing you should do is to cut off and destroy the smutty areas before the spores get ripe. Also it helps some to grow the corn in different parts of the garden.

On the fortunate side is the fact that you very seldom get enough of it on the ears so that your crop is seriously reduced. It looks bad, but it actually does less damage than it would seem.

I have been a reader and subscriber of the **AMERICAN AGRICULTURIST** for 20 years. I have a garden which has wild morning glory in it and I would like to know how it can be destroyed. The land is very hard to work as the weed grows so fast. I would like to know if you can give me any information on it.

From my own experience, the only practical way of handling wild morning glory in the garden is the good old cultivator and hoe. Some work has been done on chemical weed control in gardens, although it has been found that some crops are definitely injured this way.

If I had this trouble, I would plow the ground in the fall and then cultivate several times in the spring before the garden is planted. If your garden site could be moved, it might even be worth while to leave your garden fallow and cultivate all summer. If any readers have had experience with this weed, we would like to hear from them.

### "GLAD" EXPERIENCE

I noticed an item in the January 3 issue of **AMERICAN AGRICULTURIST** on how to have gorgeous glads for a long season by planting at different times and different depths.

I plant about 2,000 every year and I find it best to plant different kinds, such as Yvonne (pink) and Bagdad (smoky old rose) from early to late in that order. Plant early and deep, as Picardy and Bagdad are large, and the latter will hang on until frost kills it if you have both old and young corms and treat them for thrip just before planting. A corm left out in the ground, if not frozen, will be free from thrip in this section. Of course, there are hundreds of other named glads (I have had about a hundred). These are my favorites. Use plenty of fertilizer.

—A. E. Stearns, Springville, N. Y.

### USE PLENTY OF PLANT FOOD

Unless you actually figure out how much fertilizer your vegetable and flower gardens need, there is at least a good chance you are not using enough. It is worth while to pace off the areas which need fertilizer and then to broadcast 50 pounds of a 5-10-5 or 5-8-7 for each 1,000 square feet of space.

That is at the rate of about one ton per acre, which is about the minimum that a good potato grower would use; so it wouldn't hurt any, in addition to that, to use a little in the row when you plant and a little more for side dressing later in the season. One of the joys of gardening is to have things grow rapidly.

### CONTROLLING RABBITS

It is discouraging to a backyard gardener to find in the spring that small fruits and blueberries have been ruined by rabbits. The surest control is to buy enough woven wire to enclose them. We have used hardware cloth with mesh small enough to keep mice out as well.

—The Backyard Gardener

## WHEN YOU BUY **RILCO Rafters**

Your Barn's  
Almost Half Built  
Before You Start

● When you buy Rilco Rafters, you get complete, pre-engineered, pre-fabricated structural members . . . all ready to be put up. You don't waste costly man-hours measuring and sawing and fitting and nailing. Nearly half your barn building work is already done. Think of the time and construction money you can save by buying the most important parts of your barn *all ready built!*

Rilco Rafters are strong, too . . . four times stronger than any rafters you could build on the job! They're laminated into single structural units with amazingly strong structural glues . . . without a joint from foundation to ridge.

Make the next barn you build the last one . . . build it with genuine Rilco Rafters . . . build it faster, better, cheaper.

## BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

At the 1950 Storr's Conn. Egg Laying Test, our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds, all tests won in 1944-45.

WE HATCH THE YEAR 'ROUND  
White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. . . own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

SEND FOR FREE CATALOG  
This 36-page illustrated catalog describes our breeding program. Write today for your free copy.

# Infrared Heat for Brooding

By L. E. WEAVER

**R**ECENTLY a great new interest in infrared brooding has sprung up. The idea of using "heat lamps" to keep chicks warm and happy is not new. They have been used in "Ohio" home-built brooders for about ten years. Even the idea of using them without a hover is not new. During the war a bulletin which was prepared jointly by the agricultural engineering departments of Cornell and Penn State, the G.L.F., and the Pennsylvania Farm Bureau Cooperative Association pictured and told how from 80 to 200 chicks can be brooded with two "infrared reflector" lamps, without a hover. Today they use six or eight lamps and thermostats on a saw horse sort of standard. Otherwise nothing new has been added.

It is a good system. It has some excellent features all its own. Without a hover you can see all the chicks, and that is a lot of satisfaction to most people, to say nothing of the probability that the chicks will be breathing fresher air. Of course you have no hover where you brood on a heated floor by the so-called "radiant heat" system. But with infrared brooding only the area beneath the lamps is warmed. Many of us are convinced that more rugged stock is grown when the chicks can spend a part of the time away from the heat. This is one of infrared's distinctive features.

### Handy Features

Another is its light weight and small size as compared with other brooders and brooding systems. You can shift operations from one building to another if you want to, or from floor to floor. That might be easier and quicker than moving out some half-grown pullets and cleaning up for another lot of chicks. A system that depends on a boiler or furnace anchors your brooding operations to one spot. From my limited observations I would say that infrared brooding gets away, to quite an extent, from the ring of damp litter that often encircles electric brooders that have hovers.

On the other hand, infrared has its limitations just as all other systems have theirs. The first that comes to my mind is that you better not try to brood very young chicks with it in a room that is really cold. Recently I went with Lyman Hammond and some other men from the electric company which serves our territory, to a farm when the thermometer out-of-doors read 5 below zero. The week-old chicks under an eight-lamp battery in a non-insulated brooder house were not spread out in a "blanket of contentment" under the lamps, as I think they

should be for best results.

They were packed together in a rather compact mass directly under the lamps, and a constant milling went on as chicks around the edge of the mass tried to get closer to the center. Room temperature about two feet from the floor was 40 degrees, and a paper guard surrounding the brooder cut off floor drafts, yet it was evident that the area of chick comfort did not extend far enough. I have seen pictures of small chicks under I. R. lamps in large rooms where no such milling was to be seen. And at several county poultry expositions this winter, chicks in demonstrations have been quite happy and normal, even with some of the lamps blacked out by the thermostats. Room temperatures were probably around 70 degrees.

As I see it right now, if I were going to brood with infrared lamps I would wait until the worst of the winter was over, or else I would set up a coal or oil stove, or by some other means provide enough heat to keep rooms the temperature around 60 or 70 degrees. That would cut down the bill for electricity a lot too. In this connection I have heard some people question all electric brooding because of the possibility of power failures due to storms and so on. If you stop to think of it, the men with modern hot water and hot air systems are also vulnerable to power failures, with their blowers, stokers and water circulators. They too might do well to have a few coal or oil brooders for emergencies.

### Higher Cost

It costs more to brood with infrared. On a per chick basis it is not a great deal more than with other brooders, but the total for a given lot runs to several dollars. On small installations the initial cost of equipment, I believe, may be less than for equivalent capacity in hover brooders. For large jobs the story may be different.

I am assured by Mr. Hammond that neither his company nor the folks who make the lamps are anxious to promote infrared brooding, at least not right now. For one thing the supply of lamps has been exhausted. What these men are trying to do is to find the facts and answer the deluge of questions that the new interest has brought them. When something new comes along, exaggerated claims are usually made by overly-enthusiastic users, and then unfair criticism may follow when others have less glamorous results. It is not too early to say that infrared brooding has a great deal to recommend it. It is too early to pass final judgment on how it ranks in relation to other systems.

## Wonderful Results Raising Baby Chicks

Mrs. Rhoades' letter will be of utmost interest to poultry raisers. Read her experience: "Dear Sir: I think I must be one of the very first to use Walko Tablets. Some 35 years ago when I started raising chicks I saw Walko Tablets advertised as an aid in preventing the spread of disease through contaminated drinking water. I tried a package for my baby chicks with happiest results. I have depended upon Walko Tablets ever since." Mrs. Ethel Rhoades, Shenandoah, Iowa.

### You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

## Antibiotics in Poultry Feed

(Continued from page 17)

the effect of the antibiotic has been reduced.

Another theory is that antibiotics in the intestinal tract restrain the activity of harmful bacteria that otherwise would be producing mild poisons. Antibiotics have completely prevented the growth of certain disease-producing bacteria in the intestines of sheep and of pigs.

Still another possibility is that antibiotics simply kill off or prevent the multiplication of bacteria in the digestive tract so that all nutrients in the feed are available for the use of the animal, little or none having been destroyed by bacterial action. There is not much support for this theory. In fact, in some experiments the number of bacteria has actually been increased when an antibiotic was in the ration.

As for the man with chicks to be fed, he can leave the solution of this puzzle to the scientists, and be thankful for the new assurance that the mash which he buys will be more nearly complete than he has ever been able to buy in the past. The feed companies know about this new development. No doubt adequate amounts of antibiotics will be included in all starting, growing and broiler mashes. The cost is low; it should not add more than two dollars to the price of a ton.

To date, it has not been shown that it is practical, or essential, for best results to add antibiotics to rations for laying or breeding hens.

Let's keep in mind that a chick can only grow as fast or as large as its inheritance will allow. No miracle drug is going to make ostriches out of baby chicks. It is quite possible that when all the facts are in, it will be shown that when the best possible combina-

tion of energy feed, proteins (amino acids), vitamins and minerals has been put together, no addition of antibiotics or other drugs will step up the rate of chick growth still further. There is already some evidence to that effect.

Sulfa drugs can do a lot toward controlling coccidiosis, but you still can't neglect sanitation in your brooding program. Neither can antibiotics become a substitute for good nutrition.

— A. A. —

### CHICKEN SENSE

**D**ESPITE all the changes that have taken place in the poultry business there remains one factor as an essential—A good Poultryman—. The human factor must still be considered in success or failure.

Apparently the poultryman in the Northeast can do little about his largest cost—feed. The prices the poultrymen receive for their products are often beyond their control. Increasing the volume of business can be carried to a point where other factors increase costs or the management problems become greater. In most cases one cannot go on forever becoming a larger and larger operator.

Labor saving devices have a definite place but they are not a substitute for being a good poultryman. Poultry still need that personal touch or attention. A poultryman still needs to have "Chicken Sense." A big farm or a big business isn't the only hope left. There still remains unchanged the need for a poultryman who has the "know how" with birds. Quality of job with the birds, still exists as an essential objective and has not changed through the years.—Robert R. Stockbridge

— A. A. —

### DISEASE RESISTANT HENS

One of the most serious groups of diseases troubling poultry are known technically as avian leukosis. The diseases include those commonly known as "big liver," "gray eye," and "range paralysis."

Dr. F. B. Hutt and Dr. R. K. Cole of Cornell report the production of a strain of hens that are resistant to this group of diseases. This discovery may develop into something of extreme importance to poultrymen as this group of diseases accounts for more deaths than any other disease among half-grown and adult hens.

— A. A. —

### HEAVY LIFTING

Above is a drawing of a man in the proper position for lifting. Farmers have to do altogether too much lifting, with the result that thousands of them have ruptures and back injuries.

The average age of farmers is now above 50. It is dangerous for a man of that age to be throwing around hundred-pound sacks of feed or fertilizer. For years I have been advocating that these commodities should come in smaller packages and some progress has been made along this line.

In the meantime, farmers can do much to protect themselves, and one way is to get your body in the right position before you do any heavy lifting.—E. R. E.

## d-con will help you WIN the WAR ON RATS

**GUARANTEED TO CLEAR YOUR PLACE OF RATS AND MICE COMPLETELY OR YOUR MONEY BACK . . . . .**

Now, with amazing ease, you can clear your place of these disease carrying, property destroying rodents—and keep it clear, thanks to D-CON and its wonder working active ingredient WARFARIN. This scientifically developed product, discovered by the University of Wisconsin, is recommended by Federal Departments, county agents and the Farm Press of America. Its miracle, result producing action has been proven again and again in hundreds of supervised and controlled tests.

**SAFE, CLEAN, EASY TO HANDLE**  
D-CON is new, different. It outsmarts the rats because only cumulative doses prove deadly. Tests prove that rats return for successive daily feedings—they do not detect the source to avoid it—and a few days of feeding spell their doom.

**ENOUGH TO CLEAR YOUR PLACE OF RATS**  
Enough D-CON to clear the average farm of its entire rat population will be sent you in a plain wrapper with an ironclad money-back guarantee, for only **\$2.98**

**RUSH YOUR ORDER TODAY**  
**UNITED ENTERPRISES**

531 W. WEBSTER AVE. • CHICAGO 14, ILLINOIS

### RESULTS ARE GUARANTEED

Rats are smart—they have survived all efforts to destroy them. Now with miracle working D-CON, their days are numbered. D-CON will clear your place of rats in 15 days—or it won't cost you a penny. By following the simple feeding instructions, your troubles with rats and mice are over—now and forever.

**WHY FEED  
YOUR CALF  
DOLLARS?**

**When you  
can feed**

**KAFF-A**

**The safe replacement for milk!**

**Sell your cow's milk!** Don't waste it on your calves. That's just like feeding them dollars! Low cost Kaff-A is an absolutely safe replacement for milk! When you feed Kaff-A, the milk your cows produce goes to the dairy—puts dollars in your bank account. Just 1 lb. of Kaff-A can replace up to 10 lbs. of milk in calf feeding. That means every 50 lb. box fed with low-cost hay and grain can release as much as 500 lbs. of milk you can sell! A handsome extra profit!

**With Kaff-A no milk is needed after the 10th day.** Kaff-A is test-

ed, tried, proved a safe replacement for milk. A million healthy heifers have been raised on it! Its dried buttermilk base is known for its nutrition. Also, Kaff-A contains other dairy by-products, some cereal products, and Vitamin A and D Feeding Oil!

**Don't risk your calf's health** on inferior imitations of Kaff-A. A few pennies saved now may cost you many a dollar if your calf becomes a stunted cow. Feed Kaff-A and be sure that your calves get the nutrition that helps develop good milkers... good breeders! Ask your dealer for a box or pail today.

## Five Minutes to Florida!

By  
**W. B. LEWIS**

**G**REENHOUSES are nice. Through successive winters they are a source of enjoyment and give one a comfortable feeling of wealth. They do not cost too much; prorate the cost of a greenhouse that you may enjoy for twenty years and the cost per year is very small.

Looking down on our 12x40 one from the window where I am writing, I can see one section of it a mass of geranium blooms on the plants taken up from the porch boxes and flower beds last fall, and begonias as large as bushel baskets. A flat sets there in which lettuce was sown broadcast. The lettuce is six inches high and half gone, but another box has been sown. Six tomato vines five feet high are up on trellis and have 90 tomatoes, some of which are turning, and there are many blossoms.

### February Melons

In the center on the floor is a box of rich dirt 16" wide and 4 ft. long, in which cantaloupe are growing, and also blossoms to form fruit that will yet mature. We had seventeen nice melons last year in February. In the center, also, is a space 5 ft. long which is a maze of upright strings on which sweet peas are already 7 ft. high and a mass of blooms in a great variety of colors. Two green pepper plants have eight peppers for salads. Another flat, 16"x16", is thick with white hot winter radish. There is a small tank of gold fish in the corner.

It is just 5° above zero outside, but in the greenhouse it is 84°. Twenty feet away in the cellar is the freezer which is 16° below zero. In there are processed peas, green beans, carrots, sweet corn, beets, cherries, etc. Beside the freezer in the cold storage room it is 34°. In there are potatoes, cabbage, apples, squash and turnips.

On Mr. and Mrs. Jessup's place up the road, their greenhouse is about double ours—24'x36'—and one section is for potted roses, pots of lilacs and rubber plants, and things they give to friends. They have peas on strings for their table all winter long by successive planting, as well as plenty of tomatoes, cucumbers and lettuce. In flats Mr. Jessup grows several boxes of tomato and cabbage plants, for he sets out quite an acreage for the Buffalo market.

Farther up the road, Mr. and Mrs.

Sobeiski have a greenhouse about the size of Jessups'. Four years ago they went to Florida, and it cost them \$1,600 down there. When they came home they sent for an estimator on greenhouses. "Now," says Mr. Sobeiski, "we sit out in the greenhouse and read the farm papers and magazines, and it doesn't cost us \$15 to \$30 a day for the room."

Mrs. Sobeiski has a plot of lawn 4'x4' in their greenhouse over which she runs the lawn mower each week; her rocking chair with her darning basket and radio are beside her "lawn," and she listens to her favorite soap opera. She brings the cage with her four singing canaries out for an hour each morning, and opens the door. They fly around the greenhouse and take their bath in the bird bath in the corner and splash all the water they want to. No one cares.

The feeling of well-being and satisfaction you get pattering around in there in your shirt sleeves while just outside the snow is drifting is worth a thousand bucks. When you are shoveling paths around the barn doors and caring for the stock, it's nice to know that when you're through you can be in "Florida" in five minutes!

— A. A. —

### TRANSPLANTING

Why is it that some transplants start growing with hardly a setback while others hang on and eventually die or grow into stunted plants?

There are several reasons and procedures which will help. First, of course, is the growing of the plants—particularly in giving them room enough in flats so that they can develop stocky stems and good root systems. Second, about a week before you plan to set them out, run a knife lengthwise and crosswise between the plants to "block out" the plants. This will cut off roots where they have encroached on other plants, but it will cause the development of new roots within the block of soil. Third, soak the flat a couple of hours before you transplant, so that the soil around the roots will hold together. Fourth, do your transplanting in the evening and water the plants after they are set out. If added protection seems advisable, you can cover the transplants with berry baskets until they have a good foothold.

# Black Leaf

## Warfarin KILLS RATS

**Economical**—Mix one part Black Leaf Warfarin with nineteen parts corn meal or other acceptable bait material. Concentrated, tasteless, odorless, never develops "bait shyness". Destroys entire colonies of rats and mice. Full directions on the package. Sold at drug, hardware and farm supply stores.

## Use Black Leaf 40

**TO KILL Chicken Lice AND Mites**

Apply Black Leaf 40 to roosts with handy Cap Brush. Fumes rise, killing lice and feather mites, while chickens perch. One ounce treats 60 feet of roosts—90 chickens. Directions on package. Look for the Black Leaf brand when you buy pest control products.

Tobacco By-Products & Chemical Corporation • Richmond, Virginia

## Question Box

**Is Borax or Boron necessary on soils here on Long Island?**

Borax is merely a carrier of Boron. The kind used in fertilizers is generally called Borate, which is merely Borax that has not been quite so highly refined as the kind the housewife uses in the kitchen. Borax is, in fact, more widely recommended today than it was some years ago. Many fertilizer companies put a small amount in each ton as an insurance factor, and also have special grades for crops requiring more. Where they do not do this, most of them are prepared to add Boron at the request of the farmer purchasing fertilizer from them.

Boron is definitely recommended for cauliflower and rutabagas on Long Island at a rate to provide about 15 pounds of Borax to the acre. Alfalfa is another crop that in many parts of the Northeast should have regular applications of Borax. Here the usual recommendation is to apply it in sufficient quantity to average out about 20 pounds an acre a year. It can be put on, though, at two or three intervals. Some crops, like snap beans, are very sensitive to Borax and no more than 5 pounds per acre should be in the fertilizer applied for them.

In the Champlain Valley, Borax is generally recommended for apples, the amount depending on the size of the tree, and it is usually recommended for celery production to control the physiological disease known as cracked stem.

—G. H. Serviss.

**I have had four calves vaccinated, second calf heifers, that freshened from 4 to 11 days ahead of time this winter. Can you tell me the cause of this? The cows seem perfectly normal—clean quickly. The calves are large and strong.**

This does not seem to be anything unusual. The gestation period in all animals is a relative thing so that a period of a few days sooner or later than the so-called "normal" is to be expected. After all, you have four large strong calves and it seems to me you have nothing to worry about.—H. L. Gilman, N.Y.S. Veterinary College.

**I would appreciate it if you could give me any information on the control of worms in rhubarb stalks.**

This is probably the rhubarb curculio, which is similar to the plum curculio. We have evidence of slight injury from it here at times, but it has never been serious. It also infests burdocks, so keeping burdocks out of the place might help, assuming that you have them around.

The period of damage by the curculio, I am told, is only about 10 days in late May or early June, and about all there is to do is to pick the beetles.

It is also possible that the European corn borer may cause the trouble. It sometimes works on rhubarb, but I question whether you have it as far north as your location. — Paul Work.

**How does millet compare with corn for silage as far as analysis is concerned?**

Millet compares very favorably with corn for silage as far as analysis is concerned. However, the yield of corn per acre is usually much greater. Below is the analysis of each of them:

	Digestible Protein	Total Digestible Nutrients	Fat
Millet	1.6	17.5	1.0
Corn Silage	1.2	18.1	.8

Japanese millet is probably the best millet to seed for either hay, silage or for a soil building crop. Fox-tail millets and others are not so good and have at times proved injurious to some farm animals when eaten to excess.

—Frank Naegely

# CARLOADS ROLLING YOUR WAY

**HIGH TDN**

Carloads of the fresh new crop of Florida Citrus Pulp are rolling to market daily providing dairymen with a bulky, highly concentrated carbohydrate feed that provides high TDN at extremely low cost!

Florida Citrus Pulp, which is available year 'round, contains factors which stimulate milk production, thereby bringing dairy feeders increased profits. Important minerals, necessary to animal growth, are contained in Florida Citrus Pulp, and the feed imparts a sleek appearance to the cows, giving them a glossier coat of hair. It is mildly laxative, but will not cause scouring.

Ask your dealer about Florida Citrus Pulp, or write a card today to

## AUCTION GRAND CHAMP'S SONS AT ANKONY SALE

THE third annual Ankony Farm public auction sale of Aberdeen-Angus breeding stock will be held at Rhinebeck, Dutchess County, New York, at 1:00 P.M. Monday, April 2nd.

Four young bulls and 53 females will be sold, among which will be 3 sons of the 1949 International Grand Champion bull, Eileenmere 1032nd, and 8 of his daughters, 5 of the latter bred to the 1950 International Reserve Champion bull, Homeplace Eileenmere 999-35th. In addition, 30 heifers will sell guaranteed safe in calf to the Grand Champion, Eileenmere 1032nd.

Last year's Ankony Farm sale was attended by breeders from 27 states, Canada, and England, and a world's record was established when a bull calf less than three months of age sold for \$15,000.

The Ankony herd was founded 13 years ago and has established itself as one of the leading Aberdeen-Angus herds in the country. Owned and operated by Allan A. Ryan, former New York State Senator and now Chairman of the Board of Directors of Royal Typewriter Company and his partner, Lee Leachman, nationally known cat-

tleman, the herd has grown from an original investment in ten young Angus females until now there are over 400 head of purebred cattle on the farms.

— A. A. —

## HIGHEST PRICES EVER AT EARLVILLE SALE

The Feb. 7 Earlville sale averaged \$447 apiece for 111 head which is the highest average ever obtained at a regular Earlville sale, and this was the 262nd of the series.

Nine head sold for over \$700 and nine more over \$600. Sixty-eight buyers were present from 23 different counties of New York State and 6 buyers came from Penna. About 1000 people attended and it was a fast spirited event.

The cattle selling in this Feb. 7 sale were consigned voluntarily no personal selections, and the high average is remarkable when it is considered that 26 bulls were included in the average.

## APPLE LAND

By  
MABEL HEBEL

**F**ARM people who raise their own apples and only have to go to the orchard or down cellar for a supply are perhaps less aware of what has been happening to apples offered at the grocery store than city people are. Like most other fresh produce the housewife buys so easily and so casually today, apples haven't always been as available or of as high quality as they are now.

Everyone from the fruit grower to the storekeeper who arranges a tempting display can take some credit for what has happened to apples in the past 30 or 40 years. Sometimes it's hard for the grower, with all his troubles in raising apples, to realize that he is only one member of a great team. The scientist, the researcher, the transportation man, the processor, the growers' promotion man, the cold storage operator, the wholesaler, and the retailer all play vital roles. Together they and the grower make up the highly efficient food production, processing, distributing, and merchandising system that has been called "the lifeline of America," the system which has given our country the highest standard of living in the world.

Apples got their first big break when growers began to be more selective about the apples they grew. In the Northeast, even as late as 1910, much of the crop was grown in family orchards, and a lot of these orchards were in areas not ideally suited to apple culture. When competition from fancy Western apples and other fruits—oranges, bananas and even pineapples—began to make itself felt, the well located growers could afford to put more money into the crop in order to turn out a quality, competitive product. And the poor apples fell by the wayside.

Agricultural colleges and experiment stations have contributed their share through the development of better varieties of apples with better keeping qualities. Great advances have been made also in disease and insect control, and storage has come in for a lot of research and improvement.

### Change in Handling

But even the best apples, handled in the most modern fashion, are no good when they reach the market unless the storekeeper does his job too. Of late there's been a remarkable change in store handling. Part of the credit for this progress goes to the stores and part to growers' organizations such as the New York-New England Apple Institute. These organizations actively promote apple sales, and could do a lot more if they had more money to work with. It's been said that if apple growers spent just a fraction of what orange growers spend to promote their product, apple sales would skyrocket overnight.

A Cornell University professor, M. E. Brunk, has been studying apple sales in stores—or rather, he's been studying that important person, the

American housewife, to see the whys and wherefores of her buying habits. He found out that:

Sales were low on apples in bulk and in paper bags.

Sales increased somewhat when the bag had a transparent "window" so the customer could look in.

Sales went higher when cellophane bags were used.

Professor Brunk then started to experiment with various size packages. He discovered that:

A 2-lb. transparent bag sold an average of 13 pounds of apples for every 100 customers in the store.

In 4-lb. bags, average jumped to 23 lbs. per 100 customers.

In 6-lb. bags, average was 28 lbs. per 100 customers.

In 4-lb. bags of bright red apples, average was 33 pounds per 100 customers.

Quick-acting grocers already have taken advantage of this information. In checking local stores last week, I found that the A & P supermarket was using the "window" type bag, as well as selling apples in bulk. A block away, the Market Basket was selling apples mostly in 4-lb. cellophane bags—90 per cent of their apple sales, according to the manager. The cellophane bags of Macs were piled every which way on

**C**OUNTLESS babies now enjoy an apple product put up especially for them—canned strained applesauce. Here, Mrs. Jack Conner of Sunnygables Farm, Ithaca, New York, feeds her young son his applesauce direct from the sanitary small jar in which it is sold.

—Photo: C. Hadley Smith

**I**N THIS Ithaca, N. Y., A & P supermarket, McIntosh apples move at the rate of 90 bushels a week. Housewives go for the new apple package—a bag with a "window" in it which permits them to see at a glance what they're getting.

—Photo: C. Hadley Smith

**A** WHOLE new market for apples was opened up 40 years ago when Robert Douglas of Fairport, N. Y., discovered how to make Certo from dried apple pulp. His product became a best-seller when women found out that it shortened boiling time to a few minutes, produced 50 per cent more jelly, and made the jelly jell every time.

a counter, and in pointing this out to me, the manager remarked that if the bags were carefully arranged, fewer women would buy them. "Women don't like to spoil the looks of a perfect arrangement," he commented.

Vital as the fresh market is, it can't begin to use up the entire apple crop, and more than a third of it now finds an outlet through food processors. Last year, fruit growers were paid nearly \$25,000,000 by New York State food processors alone, and a large part of that sum was for apples.

Ten years ago, apple products on store shelves included apple sauce, canned sliced apples, dried apples, apple butter, cider and vinegar. Now you'll also find canned apple sauce for babies, frozen apple slices, apple juice, both canned and frozen—and just yesterday I found two more: canned baked apples, and Mott's "Apple Pom-etts." The latter, in a glass jar, were delicious looking little chunks of apple, cooked in syrup. An attractive recipe

# EASTER Breakfast

By LOUISE PRICE BELL

EASTER is a wonderful day, and the Easter season is one of the happiest in the entire year, both because of its religious significance and because the world seems to come alive at Easter time. Spring is here then, or just around the corner. So for Easter morning, plan a breakfast that will delight the family, even if it means getting up a little earlier in the morning to do it.

Make the table look as attractive and springlike as possible. If you have a sunny yellow tablecloth, put that on it. Then make a centerpiece of green shredded "straw", such as all stores have for Easter baskets each year, and a white setting-hen, with colored Easter eggs and chicks around the base.

This can be arranged on a large plate or oval platter. If you're the lucky possessor of some of those little dishes our grandmothers had with hen tops and bowl bases, they would be perfect containers for jam or marmalade.

For flowers, bring in some forsythia branches and force the blossoms. They will be lovely with the yellow tablecloth and Easter decorations. Or you might use some pussywillows, or spring flowering bulbs.

Set an Easter basket or two filled

Easter Sunday morning calls for a gay, springlike breakfast setting, no matter whether it's a buffet-style breakfast party after church or just a family breakfast that the children will love and remember a long, long time!

with rolls or cookies or toast on the table—and you might put a brightly colored Easter egg at each place, with the person's name written on it. The children would love it.

The meal can be very simple—orange juice, scrambled eggs and bacon, rolls, coffee, and milk for the children. If you plan to attend church early and breakfast afterwards, you might set the table the night before, and then you can get breakfast in a jiffy on your return.

## APPLELAND

(Continued from Opposite Page)

folder, attached to the lid of the jar, bore the Mott slogan which I borrowed for the title to this article, and pictured in color a dozen easy, wonderful desserts using the contents of the jar—apple cake, fruit cup, apple sundae, apple charlotte, apple shortcake, gingerbread with apples, apple dumplings, and others. My mouth watered at the sight of them and, needless to say, I carried home a jar. With such sales appeal, it's no wonder that processed apples are taking a larger and larger share of the crop.

Like the proverbial pig, which can be processed right down to its squeal, there's mighty little waste in an apple. Pectin jelling aids, made from apple pomace (dried apple pulp), have given Grandma a real contest in jelly making. It's forty years ago since Robert Douglas, a Scotchman who made his home in Fairport, N. Y., discovered how to extract pectin from apple pomace. At first he sold his jelling aid only to commercial jelly packers, but in 1921 housewives were able to buy it under the name of "Certo," which had

been suggested by a maid in the Douglas home.

Getting women to buy Certo was not easy at first, as they were used to boiling down their own jams and jellies. But when they found that the new product reduced the boiling time to only a few minutes, produced 50 per cent more jelly, and made it certain that the jelly would jell every time, they began to buy it in a big way.

Besides food processors, apples get another big helping hand from the manufacturers of other foods. Literally thousands of delicious recipes pour out of their test kitchens every year, and a great many of these feature apples in combination with a company's own product. The apple has such great adaptability that it is hard to think of any food it doesn't "go with."

Apples have always been outstanding for the contribution they make to good eating, and for their help in keeping the doctor away. Recently, Dr. Clive McCay, Cornell nutritionist, added another score in their favor. "Besides being one of the best regulators," he said, "apples are excellent for cleaning the teeth after a meal." So now they keep both the doctor and the dentist away!

Another crop of apples will soon be in the making in Northeast orchards. Apple blossoms will sweeten the springtime air and, come summer and fall, luscious fruit will hang from apple boughs. Countless people along "the lifeline of America" will work to grow and transport and store and process and sell those apples, or to find new uses for them; and millions of us, from babies to grandparents, will eat them and their products and be the happier and healthier for it.

### BEFORE BLOSSOMS

By Edith Shaw Butler

The March winds blow across the land,  
The March winds blow a warmer rain,  
And earth grows warmer to the hand  
Where banks of snow so long have lain.

The flowers stir beneath the sod,  
From slumber long and slumber deep;  
They stir, they push aside the clod;  
For they have promises to keep.

# Speed Queen

the washer with a  
**trouble-free future**

In buying a new washer, some important questions to ask are: "How long will it take me to do a week's washing? Will it get dirty work clothes really clean? What about repair bills and upkeep cost?"

Your Speed Queen dealer has plenty of evidence to show you that a double-wall Speed Queen is your surest guarantee for fastest wash-days, cleanest clothes, long life service and freedom from repair bill worries. See your Speed Queen dealer, or write to Speed Queen Corp., Ripon, Wis., for literature.

I have enjoyed using my Speed Queen Washer now over 35 years. It not only cleans my clothes, but does it in a short time. I sure hate to see it wear out. I can recommend this machine for anyone's use. I think it the best one ever.  
MRS. T. D. GREGORY, Okmulgee, Okla.

Our washer, which we bought in 1935, has given such good service that the only expense we had up to now was a new belt which cost us \$1.00. I still use it at an average of once each week. If all your washing machines do as much as ours has, I'm sure many people are grateful they purchased a Speed Queen.  
Mrs. EARL JOHNSON, Farmville, Va.

# For Care-Free **HEATING COMFORT** install a **MODERN Automatic Heating System**

Heating Boiler for Oil, Coal or Gas

Utica Radiators

If you are thinking of installing a modern, automatic heating system which will give you care-free heating comfort, be sure that it has all of these features:

- \* Provides dependable automatic heating.
- \* Engineered for low fuel consumption.
- \* Tailored for homes with or without basement.
- \* Made of durable, lifetime cast iron.
- \* Equipped with large capacity tankless heater.
- \* Extended jacket to house boiler and burner.
- \* Available in five sizes.

There's a *Utica* Heating System exactly right to meet your requirements... for hot water or steam, oil or coal. Mail the coupon now for complete information, without any obligation on your part.

**UTICA RADIATOR CORP.**  
UTICA 2, N. Y.

## Sewing Specials

No. **3061**. Whether you choose cotton or a dressier fabric for this button bodice style, it will be sew-easy—it has no collar, no set-in sleeves! Sizes 12-20, 36-46. Size 18, 3 5/8 yds. 35 in., with 2 1/8 yds. ruffling.

No. **2387**. Basie is the word for the bolero suit, in wool or faille now, and in linen later! The jacket, fitted, features collar and cuff detail; skirt is in four gores. Sizes 12-20, 36-46. Size 18, suit, 3 1/8 yds. 54-in.

No. **2472**. This is the perfect blouse to partner with your new Spring suits! It's quickly made—has the high neck and round yoke that looks so neat under jacket lapels. Sizes 10-20, 36-40. Size 16, 1 1/2 yds. 39-in.

No. **2209**. With its simple, cap

sleeved lines, this yoked dress is the perfect background for crisp, fashion-favored eyelet banding! Sizes 10-20. Size 16, 3 3/4 yds. 35-in. fabric, with 2 7/8 yds. eyelet banding.

No. **2146**. It will be almost no trouble to keep this dainty tucked dress ironed for daughter — because it buttons up both sides! Sizes 2-8. Size 4, 1 3/4 yds. 35-in., 7/8 yd. trim. Panties, included, 5/8 yd. 35-in.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our new Spring-Summer Fashion Book which has pattern designs for all ages, sizes and occasions. Send to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.**

## Baby's First Solid Food

By **KATHLEEN BERRESFORD, Nutritionist**

**T**he doctor tells you your baby can now have cereal or fruit, in addition to the milk or formula he has been getting. He explains that the cereal must be a refined one, long-cooked, or a prepared baby cereal. First fruits are usually applesauce or very ripe banana, mashed.

You are very thrilled about this step in your baby's progress. You prepare the new delicacy with patience and loving care. You hold Baby tenderly in your arms and feed him his first spoonful of solid food. What happens? He probably spits it out. You are disappointed. He doesn't like it. And after all the time you spent fixing it!

There are many possible reasons for Baby not accepting this first solid food. Did you place the spoon far enough back on his tongue? Babies have to learn to swallow solid food, and unless you place it far enough back on the tongue, they don't know what to do with it and spit it out. Was the food

too warm or too cool? Some like it one way, some the other. Was the texture smooth? Perhaps Baby could have handled it better if the food had been thinned with a little formula.

Some babies will eat almost anything when they are very hungry. This is usually the early afternoon feeding and a good time to try something new. Other babies demand their milk first when they are hungry, and then are willing to consider anything else you have to offer.

The important thing to remember is this: your baby does not **NEED** this little bit of solid food just at this particular time. He will grow and develop anyway. Your doctor suggested adding it now so that he could learn slowly to eat it and enjoy it by the time he does need it. So experiment a little with the suggestions above. Then if Baby really objects, wait several weeks before trying again. Babies have to be "ready" for learning experiences.

# It's OUR Library and we LOVE it!

By EDITH HORTON

**M**ORE than sixty years ago the people in our little town of Newfield, N. Y., had a great desire to start a library. Only a great desire could have made one, possible, for the people had no help from any source. They gave ice-cream socials, and oyster suppers, and trips down the lake, and plays. They had two shelves built in the post office and whenever they had a few dollars they bought books. Sometimes they even gave a note at the bank to buy them. But however they got the money, they kept right on buying books until today we have nearly five thousand volumes.

Perhaps just because the people of our town have had such a large part in developing our library and in choosing the books, it has become a beloved part of our town. It's not that our library is beautiful. Far from it! It is located in a converted store, a long narrow building in an old brick block housing a row of stores. The ceiling is high, and in places the plaster is cracked and peeling because rain has seeped through from our neighbor's gutter. The floor is old and there's no color in the room except for the bindings of the books which reach from floor to ceiling along two sides. But it is our own.

About twenty years ago the library received its only bequest. This was for one hundred dollars, and with it we bought a desk for our librarian and a sturdy oak table and chairs where folks sit to read magazines. These cost \$87, and we still have \$13 left of that one hundred! And eighty-seven, by the way, is the age of our librarian, Mrs. Buena Weatherell. She, and her sister, Miss Dora Ham, except for a brief period, have been our only librarians in these more than sixty years. Mrs. Weatherell took over on the death of her sister in 1931.

We're very proud of our librarian and couldn't imagine what the library would be without her. Still slim and straight, she runs lightly up the ladder to reach the books on the high shelves. It's her plants and flowers and pictures that give the library a homey air. When we return a book, she's always interested to know if we liked it, and she helps us to find another which she thinks we might like.

Mrs. Weatherell goes to the library

three afternoons a week from her home nearby, where she lives alone. She does all her own work, even the outside work of mowing grass, raking leaves, tending flowers, and washing windows. One of the amazing things about her library work is that she has never stopped growing in it. She adopts every suggestion, particularly about new methods of cataloguing, which the visiting librarian from Albany suggests. She keeps her finger on everything and tells the Board of Trustees what should be done and when. For all this she now receives \$250 a year from our current budget of \$700, but she would gladly serve for nothing if it were necessary.

Our comparatively large income today (compared with the old days) grew this way: About ten years after

—A. A. Staff Photo

Little by little the library at Newfield, New York, grew to today's 5,000 volumes. In the picture are Mrs. Buena Weatherell (on stepladder), librarian since 1931, and Miss Edith Horton, author of this article and trustee of the library.

the library was started, it received a charter from the state. This gave it \$100 a year. The next to contribute was the town. The amount it gives each year has now reached \$300. The last to give support was the county. From it also we receive \$300 a year. This is how we now spend our \$700 a year:

- Librarian's salary, \$250
- Books and magazines, \$200
- Janitor, wood for stove, and incidentals, \$250

The books for our library are chosen by a Book Committee, and are broken down into three main categories: fiction, non-fiction, and children's books. It is no longer necessary to send our list of selections to Albany for approval, but we think it is better to do so, and so continue the custom.

Out of our small income we have saved, over the years, about one thousand dollars with which we hope some day to repair and redecorate.

Perhaps the state librarian smiles and winces inwardly when she visits our little country library, and we do wish it were more beautiful, but it serves a great many people happily and that, after all, is the function of a library. Anyway, it's our library, and we love it.

## Words for Easter

By Eleanor Alletta Chaffee

Man's sorrow suddenly has grown as wide  
As earth is wide. So let us think today  
Of Him whose stone of grief was rolled  
aside;  
Whose night was, true to promise, etched  
by day.  
Something He said is heard across the  
sea  
Of trouble: All ye weary, come to Me!

## Mayville Woman First Prize Winner in Grange Cooking Competitions

Three-time cooking champion praises New Dry Yeast

Mrs. Olga Stratton of Mayville, New York, was a first prize winner not once but *three times* in 1950. Her food exhibits took first place at her local Grange, at the Pomona Grange, and finally at the State Grange Contest . . . where women from all over New York competed!

Relatively new to the ranks of prize-winning cooks, Mrs. Stratton joins her fellow-champions in praising Fleischmann's New Improved Active Dry Yeast. "I know I can count on

this New Dry Yeast," she says. "It gives me grand results . . . so quickly and easily."

Now's the time for yeast-raised goodies. Make Lenten and holiday meals more delicious, with delectable, wholesome treats made with yeast.

And when you bake at home—use the fastest, easiest yeast yet! Fleischmann's New Improved Active Dry Yeast dissolves in a few moments—it's faster rising, easier to use. Buy some today—you'll like it.

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. He is followed into the army by his brother Charlie, his father, George Wilson, and by Ann's father, Fred Clinton. The Wilson men join the army bands. After Mark's return to camp from an unexpected Christmas leave, the growing cold made it necessary for Enoch Payne and Tom Wilson to work a good deal of the time in the woods getting out wood for the one fire which the Wilson and Clinton families allowed themselves. During one of the tree-felling sessions Enoch is knocked down and stunned by a falling tree. Meantime, Henry Bain, who hates Mark, is making more frequent visits to the Clinton home, and one evening he declares his love for Ann, leaving in high dudgeon when she refuses to listen to him.

## CHAPTER XIV

THE long winter inched along into March. The days were longer now, and sunshiny days became more frequent. The warm sun started the sap running in the trees and burned off the snow so that the higher knolls in the pastures and meadows were beginning to show. But this year the hope that usually springs eternal in springtime was mingled with dread, for spring meant the opening of military campaigns and offensives, and perhaps wounds and even death for loved ones on the fighting front. Nancy and Ann knew, too, that spring came earlier in the South and that therefore war plans and new campaigns were well developed or even under way.

But the letters from camp continued to be cheerful. George wrote that the monotony of the long winter had been greatly lessened by the fact that he and both boys had been designated as musicians.

"You'll remember," he wrote to Nancy, "that when you and I were first married I used to get you really provoked sometimes because you couldn't stand the shrillness of my fife — although I thought I could play one pretty good. Then I added insult to injury for you by going the fife one better in noise with the rattling of my snare drum. Well, that small accomplishment has come in handy here. One day I overheard an officer say that they were having difficulty in finding musicians. I told him I could play either the fife or the drum, and also that I could teach my two boys to drum if we were permitted to do it and were appointed to the same outfit. By golly, he took me up on it, and we got the special assignment! Both Mark and Charles have shown real talent and learned quickly. We have practiced all winter in the big drum corps and we can really make the fives and drums talk. Best of all, it has given us a lot of opportunity to be together."

When Ann got Mark's letter about this news she was overjoyed, thinking it would keep him out of the front lines. Nancy said nothing, but she felt sure that musicians didn't miss much of the fighting.

Their worries about new spring campaigns were soon confirmed. Both newspaper reports and letters told of the great hope throughout the North when at last the slow and hesitating General McClellan began to move toward Richmond the army that he had spent nearly a year whipping into shape. This time instead of trying to cross the swampy wilderness country and the rivers or go overland, Mc-

Clellan landed his forces at Fort Monroe and marched up the peninsula between the York and the James rivers toward Richmond, the Confederate capital.

Letters from the front were rare now, and when they did arrive it was easy for the women to read into the attempted cheerfulness the real discouragement that lay deep in the hearts of the men. An occasional sentence would creep in about the poor food, the awful weather, and the floundering of McClellan's whole army in the swamps and mud of the peninsula. News of a battle meant days or weeks of dread for those back home until they were sure that none of their men had fallen.

Finally, early in July, the news swept the North that after months of maneuvering and days of terrible fighting on the peninsula, ending in victory for the Union forces at Malvern Hill on July 1, McClellan had decided to give up his peninsula campaign and retreat toward Washington.

Disgusted with McClellan's wavering and what many believed to be his cowardly withdrawals, the North seethed with criticism which culminated in demands on Lincoln for a new leader of the Union army. Yielding to this pressure, Lincoln appointed General Pope to succeed McClellan, and he promised to attack the Confederates straightway. Suiting action to promise, Pope advanced to the Rapahannock. The two great armies met on the old battlefield of Bull Run, where again the Union forces met disaster and were forced to retreat.

Happy and confident over the victory

at Bull Run, Robert E. Lee, commander of the Confederate forces, advanced into Maryland, with the idea that the copperheads and other Southern sympathizers would join with the Confederates to bring the war to a close. But Lee's hopes in this respect were not realized. He met McClellan, who was in command again, at Antietam on September 17, and at the end of a bloody battle Lee gave up the contest and retreated across the Potomac into the South. Once again, in spite of Lincoln's urging, McClellan failed to follow up his victory, and again Lincoln took the command from him, this time transferring it to General Burnside.

In December, Burnside attacked Lee at Fredericksburg on the Rapahannock River. Here the Union forces met defeat, Burnside was removed from command, and General Hooker took over.

Ann and Nancy were never able to forget that harrowing year. News of battles would come several days after they had taken place, followed by an agony of waiting for the slow letters from Mark, George and Charlie. It was a blessing that the hard work of everyday living filled their days so fully that there was not much time even for worry.

Early one June day Ann was cultivating a piece of corn that she had planted. As she reached the end of a row she pulled the old mare around with the lines and swung her cultivator expertly into the next row. Then she climbed to the top of the rail fence to give herself and the horse a breathing spell. Looking out across the cornfield, where the crop was now several inches high, and thinking of the oats and potatoes that she had managed to get planted in addition to the regular chores of a small dairy, Ann was conscious of some pride in her own husbandry. Enoch had plowed and fitted the ground for her, but aside from that she had tarred the corn, got it dropped and covered by hand, and had planted the potatoes; and the sight of her crops in the bright summer sunshine made her realize that they looked better than any her father had ever had at this time of year. Again she thrilled to the thought of how much help she could be to Mark when he got back and they started out to make a living together.

In spite of her hard work, she felt

strong and well, and she rejoiced for Mark's sake in her strong, supple young body. But then came the disturbing fear that he might never come back. Seated on the crooked rail fence, with only the hum of insects to break the silence, it almost seemed to Ann that if she listened carefully she could hear the rumble and grumble of the battle far away to the South. She shivered, but then, shaking her head resolutely, slid down from the fence, put the lines over her shoulder, took hold of the cultivator handles and started the old horse along the row. If she worked hard enough, she thought, she could drug herself with it and leave no time nor energy for thinking.

It was a high spot in Ann's day when Mark did write, but she never blamed him when he didn't, for she realized how hard it must be for him to do so, particularly when he was with McClellan in the peninsula campaign. How she prized his letters. She saved every one, read and re-read them, and carried them next to her heart day after day until they were almost worn out. It pleased her to note how much Mark's writing had improved as time went on. It seemed that he was able to express in the written word his loneliness and his love for her as he never could have done orally.

"My darling," he wrote some time before the second Bull Run battle, "tomorrow, or maybe the next day, rumor has it that we are going into another great fight. So before I sleep tonight I want to tell you all over again how much you mean to me, and how much I love you. When I enlisted, I thought it was my duty to do so, but honestly I also thought it would be a great adventure. Well, it isn't. War is terrible. I know that now. Of course, there is some excitement and a lot of comradeship with other boys, all of which helps to pass the time and makes it easier for us than for you and Mother who have to keep things going at home. Father and Charlie and I talk about you and the family so many times, and we worry about how you can keep the farm work going so that you all have enough to eat and to wear."

As you know, we have tried not to spend a cent of the small pay we get so that there may be a little to send home, but I know that it doesn't help much, especially when you have to worry about that old mortgage. I hope Henry Bain isn't bothering you about the interest, or anything else."

Ann paused in her reading and thought:

"Now I wonder what Mark means by that 'anything else.' Maybe he's a little jealous. And maybe he has some right to be. If I told him how much I worry about Henry Bain, not only about the interest on the mortgage but about his hanging around so much, I honestly believe he'd desert and come home. I can't do a thing about it, either, for if I send Henry packing, then he'll be mad and put Mother and me out of our home just as sure as preaching. Well," she sighed, "there's no use worrying Mark about it."

She went on with the rest of Mark's letter:

"What I really wanted to say in this letter, sweetheart, was just three little words which I didn't say often enough when I was beside you, three little words which I hope you will write on your heart. You know what they are: I love you!"

"Ann, I don't want to be gloomy or silly, but I'd like to say to you just once that if anything should happen to me, I want you always to remember that you owe me nothing but what you have given me, your love. That's the greatest and most precious gift of all. You have all of your life ahead of you. I know that you wouldn't think of nor have any desire for marriage for a time, but I want to tell you now that if I should not come back, I hope in time that you will remarry. You can, you

(Continued on Opposite Page)

## SLIM &amp; SPUD

## Farewell

# NO DRUMS

(Continued from Opposite Page)

know. An attractive girl like you has everything, and above all, in this world and the next, I want you to be happy."

Ann shed tears over that letter.

"The big ninny," she said aloud, "to think that I could ever love anybody else."

She laid the letter down and her thoughts again came back to what Mark had said about Henry Bain's worrying her.

"I am worried," she thought, "and Mother's attitude makes the situation worse. I suppose Mother feels that if we aren't friendly with Henry, he'll dump us both out."

She got up and paced restlessly back and forth across the room.

"For me, he can take the old farm and I'll go back to teaching!"

Struck with the new idea, her face lighted up.

"Maybe that's the answer. I'll talk with Mother tomorrow."

Next morning Ann said:

"Mother, I want to talk with you frankly about something that has worried me for a long time. I don't like Henry Bain's coming here so much, nor the things he has said to me two or three times lately. After all, I'm a married woman, I love my husband, and I have no interest whatever in Henry Bain."

Mrs. Clinton said, quickly:

"I know, my dear, I know. But that's no reason why we shouldn't be pleasant and kind with our friends, and you're almost impolite to Henry every time he comes."

"Well, I just don't want him coming here. I don't think it looks well, either."

"Well," said Mrs. Clinton, "if we make him mad, you know what he may do to us. He holds the mortgage, and we aren't making the payments."

"Don't think I haven't thought about that," Ann snapped back. "But now I think I know the answer. Let him take the place. I'll go back to teaching, and we'll be in better shape financially than we'll ever be trying to make a living on this old farm, especially with someone like Bain on our necks."

At this her mother started to cry.

"This is my home," she wailed. "I'd never be happy anywhere else. And besides—think of your father. What would he have to come back to?"

"Oh all right," said Ann, hopelessly. "I might have known it would be this way..."

She said no more about it, and tried not to worry.

After Bull Run no more letters came and Ann would turn away from the post office sick with fear. Sometimes she was irritated. He must know I'm worried and he could write a few lines, she told herself. I know it's hard for him, but somehow he should get word to me. Nancy, too, was worried, for she had no word from George and Charlie, but she tried to reassure Ann.

"You know how hard it is for them to get time to write. No news is good news, you know."

Then disaster struck. Ann found a letter at the post office, not from Mark but from George to Nancy. Running most of the way back to the Wilson home, she pushed the letter at Nancy impatiently and cried:

"Read it, quick. Read it and tell me."

With fingers that no effort of will could keep from trembling, Nancy tore open the letter and glanced over the contents. Her face turned white and she sank into a chair.

"What is it? What's the matter, Mother?" cried Ann, in terror.

Nancy braced herself to tell Ann the contents of the letter.

"I can't believe it," she said slowly, her voice trembling, "but George says that Mark has been court-martialed!"

Stunned, Ann stared at her uncomprehendingly.

"Court-martialed!" she echoed. "But

why? I don't believe it! There must be some mistake."

Then with a sob, she sank to her knees and buried her face in Nancy's lap.

## CHAPTER 15

"I can take it now," said Ann, quietly, a few moments later. "Please read the letter to me."

Nancy looked at the girl's dead-white face, drew a deep breath, and began to read aloud her husband's long letter:

"You'll remember, Nancy, that boy from Virginia who came to our neighborhood to visit the Royce's two years ago this summer. His name was Floyd Morton. If I remember right, he was some relation to Mrs. Royce. He was a very agreeable young chap, made friends easily, and our Mark took quite a shine to him.

"Well, when the outposts and picket lines of the armies were close together on the night before Bull Run, Mark was on picket duty. He told me what happened. He was walking slowly back and forth across his beat, waiting for the hours to pass until he could be relieved and get some sleep. Suddenly he heard a noise in a clump of brush that he had just passed. He dropped flat on the ground and bringing his musket to bear on the brush challenged: 'Who goes there?' The answer surprised him. It was, 'Someone you know.'

"Mark told the man to drop his gun and come out of the brush with his hands up to where he could be seen in the half light. The fellow obeyed, and then Mark found it was this Floyd Morton. He told Mark he was unarmed and that he wasn't in the Confederate forces—wasn't even a Rebel sympathizer. He had a convincing story about being engaged to a girl behind the Union lines. Said he hadn't heard from her in months, didn't even know if she was alive, and in desperation had started out to go to her home. Mark asked him why he hadn't been drafted, and he claimed he had been doing some kind of civilian war work back of the Confederate lines.

"The boy claimed that while hiding in the clump of brush, waiting for an opportunity to get through, he had recognized Mark and purposely attracted his attention. His logical story, plus Mark's old liking for him and sympathy for anyone in love, won Mark's confidence. Some way or other Morton also convinced him that his civilian clothes were proof that he was just what he claimed to be, a Virginia farm boy trying to get news of his girl.

"Anyway, Mark let him through, but just then the pickets were changed and the man who relieved Mark saw him talking to Morton. He arrested Morton, marched him back to an officer, and reported that Mark had allowed the fellow to pass the picket line. Morton was recognized as a spy, court-martialed the next day, and sentenced to be shot. For allowing Morton through, Mark was arrested and court-martialed, and is also under sentence of death.

"Fortunately, I have made friends among the officers, and through them I succeeded in getting a stay of execution, at least for a short time on a reasonable doubt of Mark's guilt. But I feel that you and Ann have a right to know the truth. The constant reverses of the Union forces, frequent desertions, and the prevalence of spies within our lines are making our officers stiffnecked in their determination to enforce discipline and to get this army of citizens on a military basis. So Mark's chances aren't too good."

Nancy paused to try to control her voice and her trembling hands, and then continued:

"S-some of his friends and mine have suggested an appeal to President Lincoln, but when I tried to get a furlough or even a few days to go to Washington, the officers refused. They

didn't give me a reason for not letting me go, but it is generally known that they try to keep information about these court-martial cases away from the President because of his tendency to pardon the prisoners, which the generals feel interferes with military discipline."

In closing his letter, George added: "Don't give up hope. There must be some way out."

But his own agony and hopelessness were very evident. When Nancy ceased reading, she glanced at Ann sitting in the chair opposite, and noticed how white were the knuckles of her hands as she gripped them in an effort to keep control. Suddenly Ann's face flushed and she jumped to her feet and stood over Nancy, her eyes snapping!

"All right," she cried. "They wouldn't let Father Wilson go to Washington, but they can't keep us from going."

The sheets of the letter fell from Nancy's lap as she, too, sprang to her feet and clutched Ann's arms so hard that the black and blue spots showed later.

"Of course, we'll go! she exclaimed, excitedly. "We'll start tomorrow morning."

"Maybe I should go alone," said Ann. "Can you leave the children?"

"We can do anything when we have to," said Nancy. "You aren't making a trip like that alone. Mary Curtis'll come in and stay with the children, and Enoch will be glad to help out with the chores both here and at your place, and see that your mother gets along all right. We'll get off tomorrow morning at daylight, and Enoch can drive us to Owego. Better go home now and tell your mother. Don't pack too many things for the trip. Get what sleep you can, and Enoch and I will be at your place early tomorrow morning."

That trip behind the old horse to Owego next morning and then by train to Washington was an experience both women tried to forget for the rest of their lives, but never quite succeeded in doing so. Every farm passed, every foot of the dusty highway to Owego was like a knifethrust to Ann as she recalled the journey with Mark the morning after their wedding. Every

"In an issue of *American Agriculturist* I noticed a picture of a little baby and a calf. By an odd coincidence I have a similar picture which is one of my favorites. I have entitled it, 'Is Your Head As Hard As Mine?' This picture of my son was taken when he was six months old, the Holstein bull calf was two months old."—Mrs. William Smith, Tunkhannock, Penna.

rhythmic turn of the car wheels on the long rail trip to Washington seemed to be saying: "You can't do it; you can't do it."

Their eyes bloodshot from lack of sleep and the dust and cinders of the train, and their clothes disheveled, Ann and Nancy, feeling completely exhausted, finally arrived in the great sprawling city that was the capital of the United States. They descended from the train into a welter of heat, confusion, noise and bustle, punctuated by the yells of the cab drivers just outside the station. The crowd that they finally pushed themselves through were a motley and varied lot, most of them different from anyone the women had ever known. There were men with tall stovepipe hats, expensive clothes, immaculate linen and black bow ties, who had somehow managed to keep themselves looking well groomed in spite of the train ride; there were a few women looking as lost and bewildered as Ann and Nancy felt, making their way hesitantly through the crowd, perhaps going to visit a wounded soldier son or husband in the Washington hospitals. And then there were the young men, also looking bewildered and homesick, recruits for Abraham Lincoln's army, who were being guided by the shouted commands of a non-commissioned officer in uniform.

Outside the station, Nancy succeeded in getting a bewhiskered, one-eyed cab driver to stop shouting long enough to listen to her request to be driven to the White House. His gaze showed that he wondered what two plainly dressed country women could want at the White House. Then, shifting a cud of tobacco to the other side of his mouth, he drove a long stream of tobacco juice toward the wheel of his cab, and grunted:

"Climb in! I'll take ye up there. Whether ye can get in or not is something else again!"

Accustomed to thinking of Washington as a storybook city, the Capital of the great United States, Ann was disappointed with the reality. Her tired state added to her disillusionment. It had rained the night before, turning the inches of dust on Pennsylvania Avenue to a soft, disgusting, sticky mess, through which their cab driver raced his old horse. Mud rained from the horse's flying hoofs and from the rapidly revolving wheels in a spattering shower, some of it reaching the occupants of the cab. But in spite of the mud and the hard going, everyone seemed to be in a hurry, joining in the mad rush of vehicles of every description that raced up and down the wide Avenue.

Ann had read about the beautiful government buildings, and they lived up to the description, but they were surrounded by rambling, down-at-the-heel business places and dwelling houses. Washington, Ann reflected, was certainly no dream city. The whole aspect of the place was in keeping with her own churning thoughts.

When their driver pulled up in front of the White House, even that was disappointing to Ann. She had expected something of a palace to house the head of the nation. But later she was to realize that the very simplicity of the White House was in keeping with the President who now lived there and with his ideas of the basic principles of democracy.

To the guard at the outer door Nancy said, simply:

"We want to see Mr. Lincoln on a matter of life and death!"

The man looked them up and down, noting their countrified appearance and their white, strained faces, then muttered:

"Life and death! That's what they all say." Then he added, gruffly:

"Go ahead! But don't be surprised if the President can't see you. He's a busy man."

## SUNNYGABLES NOTES

By John Babcock

**A**NIMAL agriculture and grassland farming are two terms that have a familiar, warm ring to the ears of north-eastern farmers. They are, in fact, two broad agricultural practices that are fast breaking ground to provide everyone in the United States with better meals and a higher standard of living. Happily, an animal agriculture program based on a system of grassland farming is something that not only benefits the farmers who adopt it but also serves human welfare in general. That is the kind of endeavor a fellow likes to latch onto during times when service to others seems to be at low ebb throughout the world.

In the interests of mankind, our country is making titanic efforts to hold a shaky world together. We are trying our best to seek out and most effectively combat communism by feeding people, by talking fairly with people when we can, and by fighting them where we have to.

Of all our national efforts to reach the same end, there is a meeting taking place next month that may ultimately achieve more toward happiness and health in this country than anything else being attempted.

April 16th through 18th, the first annual meeting of the National Institute of Animal Agriculture will take place at Purdue University in Indiana. At this centrally located and justly famous agricultural college, the very top leaders of business and agriculture from all over the country will seek the means of giving teeth to a program of animal agriculture. Their common meeting ground is that no one opposes a philosophy that benefits everyone.

We farmers of the Northeast have been living animal agriculture and grassland farming for a long time. A nationally backed program to support and advance our livestock population finds its roots on the family farms we live on.

### Basement Barn

Since pen stabling has been recognized and adopted by dairymen, the basements of many barns have come under serious study to see whether they have the necessary ceiling height, square feet of space and possibilities for arrangement into a pen stable set-up.

Beets' pen needs cleaning twice a year. With a lot of hills to cover and the rugged winter we have had, the first cleaning took more time than usual. Things are in good shape now, thanks to frozen ground and some hard work. At one time though, Beets' brother Bud was racing to see if he could get to the floor before the cows reached the ceiling.

Martin Sine, whom I previously have mentioned on this page, started from scratch to house the cows he already owned. This sounds like a backwards way to go at things, but Martin was burned out by lightning last summer. The cows were saved, and the problem was a place to house them. Today Martin has what I consider an ideal barn basement for handling a dairy herd. All he lacks is a barn on top of the basement.

Starting with the theory that cows need housing worse than feed does, Martin skidder out lumber with his team this winter, had it rough sawed, and started to build his new barn on the site of the inadequate old building. There has been no barn raising. Yet, his Guernseys are comfortably housed and look fine.

### Planning Ahead

With blocks, or walls poured by a sand and gravel business which is conveniently only a few hundred yards from his farm, Martin planned a ceiling with plenty of height for manure pack accumulation and built a barn floor that is adequately braced for all of the weight a barn floor has ever been required to take. Over the floor, Martin laid inexpensive waterproof paper which will eventually serve as an

airtight seal between the basement and the feed storage above. Now it serves as his roof.

By inexpensively refinishing the stanchions which went through the fire, Martin has a conventional stanchion barn. He so utilized the equipment that survived the fire that he is able to plan ahead to the day when he can clear out the stanchions and with the adjoining space he has added have 4,000 square feet of bedded pen stable space.

I guess they call it vision when a man plans way ahead of what his present means can provide, but that is what Martin has done. He has adequate housing for his cattle, a place to have cover for his forage and bedding before they are ready to go in, and a sensible dream of an efficient, easy-to-manage pen stable.

### FERTILIZER SCHEDULE

When it came to buying fertilizer for our meadows this spring, Jack and I had to make the decision as to where the amount we had budgeted for would be applied. Since there was just so much money to go around, we could not be "book" farmers and cover each field just as the best recommendations suggested. Quite often a farmer can nod his head in agreement with the practices recommended by experts, but digging up the money to put them into action is another thing.

### Stay Close to Home

We finally decided first to give a heavy application to the pastures and hayfields that have produced heavily because of irrigation, and then to concentrate on the fields handiest to the barn.

Our decision to get the most out of the fields next to the farm buildings satisfies us. In the first place, as pastures, the dual purpose meadows will carry more cows for more days, and keep the cows within easy reach for milking and inspection. The time each busy summer day spent in rounding up the milking herd cannot be afforded.

Then, too, when the fields are used for grass silage and hay, the travel time and cost of hauling forage is reduced by having maximum production close to the home base.

Out where I have been working in Ohio and Indiana, farmers have many fields laid out in nice forty-acre squares around the barn. We have to fight for enough productive acreage that can be worked here in the Northeast, and sometimes we tend to range out too far to get it. Half of our time is spent on the road transporting ourselves or equipment from job to job.

To keep our production close to home, we at Sunnygables finally decided to start from the barn and concentrate on each field that is handy for hay or pasture. They will get a heavy dose of phosphate and potash early in the spring, with a second application following after first cutting. This will slight some nice meadows farther down the road, but we'll try to get to them later.

In addition to covering hay and grazing land, we are giving the wheat an early treatment of superphosphate to get the seedlings off to a good start before they are completely shaded out by the wheat.

### A CALF'S BEST FRIEND

Some of our calves are raised under confinement without milk, and others are run on nurse cows. Either method works out well, and there is some gain in marketing the milk saved by taking the calf away from the cow early.

We have noticed, though, that if there is the slightest slip in management, a bad break in the weather, or any accidental happening that injures the calf's delicate start in life, the ones with their mothers (or in our case—nurse cows) come through with flying colors. In fact, where calves have been running with nurse cows, we have given them far less protection from the cold and far less personal attention. The little rascals have rough looking winter coats, but under the hair they are growthy and bright-eyed.

## EXPECT ONE-MILLIONTH TRAFFIC DEATH

THE National Safety Council has estimated that recorded deaths in America will reach the one million mark some time in December of this year. Who the one-millionth victim will be, or where he or she will be killed, nobody can say because with traffic deaths averaging 95 a day, it will be virtually impossible to single out the one that will be the millionth.

Fatalities in January were up 17% over January of 1950. This represents the greatest monthly gain in almost 4½ years. The January total of 2,890 raised the United States death toll since the turn of the century to 966,250. That leaves only 33,750 victims to be counted until the one million mark is reached, which probably will be in December if the current upward trend of fatalities continues.

Ned. H. Dearborn, President of the National Safety Council, says that the day when the millionth person will be killed in a traffic accident can be deferred several months "if every motorist and pedestrian makes a personal pledge to avoid only one accident—the one that involves him."

The Council has begun a nationwide educational campaign to postpone the day of the millionth traffic death. Its aim is capsuled in this slogan, "Don't YOU be one in a million."

## HIGH PRESSURE TACTICS

Some time ago, a salesman tried to sell me some blankets, claiming they were 100% wool and absolutely perfect in every way. I told him I would not buy them until I had talked it over with my husband. He insisted on leaving them, and said he would be back in a few days. I did not sign any contract or order. Later, another representative of the company called on me, and I told him about these blankets. He said he would have them picked up. I have heard nothing since then except for several dunning letters asking me for pay for them.

Since the subscriber did not sign any order, she cannot be made to pay for the blankets. We are reporting the whole transaction to the company, and are asking them to pick up the blankets and discontinue the dunning letters.

The subscriber tells us that she found, on examining the blankets, that they were cotton rather than wool and that they were frayed in places. Since he misrepresented the merchandise, it seems probable that the salesman never intended to come back after the blankets. Much difficulty could have been avoided had the subscriber insisted that he take them along with him and bring them back later when her husband would be home.

## TAXES

I recently bought a small country place which has about seven acres, and have been told that the taxes will probably be raised to almost double what they were, based on the price I paid for the property. This doesn't seem fair to me. Other people, who have owned their property for years, have not had their assessments raised in spite of the fact that their property has also been getting more valuable and would have a much greater sale value than it had fifteen years ago.

The Service Bureau has had a number of letters similar to the one above. It doesn't seem right that taxes should be doubled in one year, since the increase in value of the property has been gradual over a number of years. We know of one case where the new owner argued that the increase was too much for any single year, and the taxes were lowered somewhat.

When increases in taxes have result-

ed after property has been sold, assessors have maintained that they run into complaints from state officials if the assessed value is too far below the actual sale price.

The best thing to do is to take your case to the authorities on the next Grievance Day, which should be some time in August. Present the facts to them, and argue that the increase be cut down somewhat.

— A.A. —

## REPORT CLAIMS PROMPTLY

About a year ago, I bought 26 capons. I didn't know much about them at the time, but later learned that more than half of them were just plain roosters. Since we paid a good price for them, we complained to the hatchery, but we never got any adjustment. Could you help us get a refund?

Under ordinary circumstances, the Service Bureau cannot handle claims that are over a year old. One of the reasons for this is that if a claim hasn't been settled in that length of time, our efforts are almost certain to be wasted.

Had we known about the above complaint soon after the birds were purchased, we probably could have arranged a satisfactory adjustment. We are contacting the hatchery, but are not too optimistic about the outcome.

If you have occasion to call on us, remember that promptness in reporting unsatisfactory dealings is extremely important.

— A.A. —

## NOTES

I am holding a note signed by a woman who formerly worked with me. Several attempts have been made to collect this, and one small payment was made on it. However, I can't get the balance. Isn't there any way a person who holds such a note is protected and can get his money back without legal action?

Loaning money is a ticklish proposition. It is usually done with the idea that the person to whom you loan is honest and will repay it at the earliest possible moment. Actually, a signed note is little more than an acknowledgment of a debt. If the signer refuses to pay, it is a civil matter and the holder of the note must go to court to collect. Even then he doesn't always get his money if the debtor has no assets. Of course, a judgment can be obtained, but it may be years before the creditor can collect on it.

— A.A. —

## CANADIAN STOCKS

I have a letter from an outfit in Toronto, Ontario, Canada, offering stocks in some mining operations in Canada. What do you think about such stocks?

Periodically, the Service Bureau gets a flood of inquiries about investing in oil or silver mines in Canada. We are suspicious of firms that solicit investments through the mail from Canada. We have found that in many cases these fellows have been asked to discontinue doing business in the States, so have gone to Canada to carry on from there through the mail.

We do not give advice on any kind of investments. However, we feel it is important to investigate very carefully before putting money into unknown enterprises. In the case of the company mentioned above, information about it could no doubt be secured by writing to the Toronto Better Business Bureau.

— A.A. —

## CORRECTION

On the editorial page in our February 17 issue, I referred to the Boston strike and the promptness and courage with which Cal Coolidge put it down, and referred to Coolidge as the then Mayor of Boston. That, of course, was an error. He never was mayor of Boston, but was Governor of Massachusetts when the strike occurred.—E.R.E.

# DRIVER CRUSHED INTO DASH

AARON B. WITHAM, of Deerfield, N. H. was killed.

They had to free his twisted body from the control panel with an acetylene torch after his pickup truck sped off the highway, glanced off one tree and twisted into another. Apparently the gas pedal which recently had been sticking snapped to the floor causing the pickup cattle truck to go out of control with a sudden burst of speed.

## His Widow Writes:

Dear Sirs:

Your agent Mr. Thompson has delivered my check for \$1000.00 in payment for my claim in connection with my husband's tragic death in his pickup truck on November 17, 1950.

May I take this opportunity for thanking you for this splendid service offered at so low a cost. It is my hope that more farm folks may avail themselves of this wonderful insurance.

Sincerely,

*Esther A. Witham*

**THIS ATLANTIC  
ONE-STOP SERVICE IS  
A GREAT THING  
FOR A BUSY FARMER**

That's what Harry Erwin told me the first time I drove up to his farm. "You know," he told me, "I've had my gasoline, tractor fuels, kerosene and fuel oils delivered for years. But it always seemed that all the things I wanted were never on the truck."

Well, just to show both you and Harry that won't happen now, we unloaded every compartment of my new truck, and had this picture taken. Not much chance of my running out or not having enough, is there?

"And this meter ticket printer," Harry said, "tells a man what he's getting. I see it in black and white, and I've got a record for taxes. And I don't even have to be on hand."

"I like your having separate tanks and hoses for gasoline and oil, too," Harry told me. "There's no chance of any gasoline or tractor fuels getting in a kerosene or fuel oil tank that way."

Just before I left, Harry said, "You know, this is the first time I've ever been able to get all I wanted at one time. And I like it! Because when a man's busy he just doesn't like to fuss around waiting for a gallon of this or that." You can see from what Harry Erwin said that he's mighty glad he called us. And we think that, if you give us a try, you'll be happy about it too. We'll do our best to give you good service. And we've got the finest products you can buy . . . Atlantic products. So let's hear from you. All it takes is a telephone call.

## Run YOUR Own PUBLIC BUSINESS

ATTEND YOUR SCHOOL AND TOWN MEETINGS  
AND MAKE GRASS ROOTS GOVERNMENT WORK

**O**NE OF MY earliest recollections is of going to the annual meeting of our local school district with my father. The meeting was held in August. The one-room schoolhouse, closed since the last day of school in June, was hot and stuffy and smelled evilly of the kerosene lanterns. There might have been 8 or 10 voters present.

The meeting was poorly conducted. Someone who was absent was elected trustee, for if he had been present the chances were he wouldn't have taken the job. Other officers were elected, and a budget and tax rate were approved.

### It's Your Money

In spite of all the good progress that has been made in schools since that time, there has been little improvement in attendance or procedure at school meetings. Just recently a friend was telling me about a central school meeting where it was necessary to approve or disapprove a budget calling for the spending of thousands of dollars of taxpayers' money and to act on other important issues. But not over 20 voters were on hand.

With the exception of some communities where people are beginning to take some real interest in their schools, about the only time there is good attendance at a school meeting is when there is some kind of a row on. With one notable exception, this is true, also, of the annual town and village meetings and caucuses. The exception is in the New England

states. There the town meeting is still a great democratic institution, where both town and school affairs are discussed and voted upon, and where the people are interested enough in their schools and in their government to get out and take part in these meetings.

In recent years we have been rapidly losing control of our affairs through centralization of government away from the localities. But we, the people, and our local leaders are largely to blame for this sad state of affairs. We can be sure that if we don't attend to our public business, somebody else will.

### No Cause for Complaint

I have absolutely no patience with the man or woman who is constantly complaining about the schools and the town or county government, but has not taken the trouble to visit the schools or attend the annual meetings, or to keep himself informed in any other way as to what is going on. That person gets nowhere with me, either, when he comes back with the excuse that there's no use going because everything is cut and dried. My report is, Why not do a little cutting and drying yourself?

All right, you say, what can I do?

To answer that question let me remind you of what farmers and farm leaders have done in their organizations. When I first started to work with farmers, the average farm meeting

(Continued on Page 10)

*Good News  
for Careful Buyers  
... the Formula is*

# Back on the Tag

**T**HE open formula tag, showing the exact amount of each ingredient in the feed, is back again on the G.L.F. flexible formula dairy feed bags.

In 1947, the ingredient picture was changing rapidly from day to day. Slight changes in feed formulas had to be made frequently and on short notice; new feed tags couldn't be printed fast enough to keep up. During this period the formula was shipped with each ear of feed, and was always available at G.L.F. Service Agencies. Now that supplies of most ingredients are fairly stable, the open formula is again on every tag.

The open formula is just like having a window in the feed bag—it lets you look right into the feed and see what it's made of.

It lets you see not only what ingredients are used to mix the feed, but the exact amount of each ingredient as well.

## *A Standard - For Quality and Price*

Right now, during one of the heaviest feeding periods of the year, it is important to know just where every feed dollar is going—the kind of feed it's buying, and the results it's getting. Take a good look at the open formula on a G.L.F. Dairy Feed tag—compare the market cost ingredient by ingredient with other ready mixed feeds or a locally mixed combination of similar ingredients. The facts will be convincing.

Cooperative G.L.F. Exchange, Inc., Ithaca, New York.

**G.L.F.** *Flexible Formula* **Dairy Feeds**

# Livestock Champions

**T**HE first annual New York Fat Stock Show was held at Empire's Caledonia Stockyards on Friday, November 3, 1950. Farmers and Extension Service people organized this stock show for three reasons:

1. To provide an object lesson in marketing and market grades.
2. To stimulate a greater interest in the production of higher quality livestock of the type desired by the consumer.
3. To offer boys and girls an incentive for greater effort.

In addition to the open classes, there was a section for boys and girls' livestock.

Since this was a fat stock show, classes were for lambs, hogs and cattle. Each class showed for five place ribbons and Champion and Reserve Champion rosettes were awarded.

Judging of the pens and lots took place in the morning. Singles were judged in the afternoon. The judges—C. R. "Bob" Martin for cattle, Robert E. Rector for lambs and Palmer Flournoy for hogs—explained their placings carefully for the benefit of the exhibitors.

All livestock consigned to the New York Fat Stock Show was sold at auction on the evening of the sale. Buyers received duplicate ribbons with the livestock they purchased.

The show was open to anyone and livestock was consigned on a statewide basis. The winner of the 4-H Steer class, for example, lived in Columbia County.

This New York Fat Stock Show is going to be carried on year after year according to the present plans of the farmers and Extension Service men who act as the guiding committee.

4-H Grand and Reserve Grand Champion steers. Lawrence Brink, Barton, on left. Richard Hoellerick, Malden Bridge, with his Grand Champion 4-H steer on right.

Sam Adams, Sodus, right, and his Grand Champion 4-H pen of lambs. George Stottman, Conesus, on left, helps Sam hold the lambs. The four lambs were Southdown-Cheviot crosses and weighed 360 lbs. P and C Family Foods, Syracuse, paid 60c per pound.

Helen Acomb, Dansville, affiliated with Steuben County 4-H Clubs and her first place 4-H pen of hogs. Helen's three Hampshires weighed a total of 625 pounds and Keile and Kless, Buffalo, paid 34c per pound for them.

Richard Hoellerick, Malden Bridge, Columbia County, New York, and his Grand Champion 4-H steer. The Angus weighed 1200 lbs. and brought 52c per pound and was bought by Loblaw's, Inc., Buffalo. On right is George Zitzler, Loblaw's buyer.

Teddy Marshall, Venice Center, Cayuga County, New York and his 4-H Grand Champion barrow.

Sam Adams, Sodus, Wayne County, New York, poses with his Grand Champion 4-H lamb, a cheviot. The lamb weighed 90 lbs. and Mrs. E. P. Forrestel, Akron, New York, right, bought it for \$1.40 per lb.

Tune in "Grand Ole Opry", Saturday Nights on NBC

# THE EDITORIAL PAGE

## BALING WIRE AND TWINE STILL SHORT

IN OUR March 17 issue we called attention to the serious situation that exists regarding the ability of dealers and farmers to get enough baling wire and twine. As a result, both wire and twine were put on a priority list by the government.

But the serious situation still exists. In 1950, New York State farmers alone used 1,471 tons of baling wire. Already in 1951 farmers have ordered 1,895 tons. But according to delivery promises, New York farmers will get only 1,240 tons this year out of the 1,895 tons needed, or 65% of their needed supply. Unless this situation can be changed, one-third of these farmers won't have any wire, or all of them will have only two-thirds of what they need. The same scarcity problem exists throughout the Northeast.

The twine situation is a little better. Indications are now that there will be nearly enough, providing each farmer doesn't take a pound more than he actually needs. But in order to make sure of a supply, many farmers will take more than they need, so others will go without.

This situation regarding the supply of baling wire and twine has been presented to the authorities in Washington. But we need help. If farmers would only do what labor union members and officers and other city people do in the way of writing letters and sending telegrams, agriculture would get a better deal. If you use either wire or twine, won't you write Mr. W. R. Alstetter, Deputy Director, Office of Materials and Facilities, Production and Marketing Administration, U. S. Department of Agriculture, Washington 25, D. C., and ask him to make sure that farmers are not handicapped by lack of these very essential supplies?

## IF YOUR BUILDINGS BURNED

I WOULD feel that I had done you a real service if you would lay down this paper at this point, look up your insurance policy, and give some thought to where you would be if your buildings burned. Chances are ten to one that your insurance would not cover your loss.

We are coming into the lightning season again. Every time we get an electrical storm I am glad that my buildings are well protected with lightning rods, and I make sure several times a year that the rods are properly grounded. A few moments taken right now to check over the fire hazards on your place, your electrical wiring, your lightning rods (if you have them), and your chimneys could be the most valuable time you ever spent in your life.

## CLEAN THE RASCALS OUT

NO AMERICAN citizen can listen to television, to the radio or read newspaper reports of the testimony of witnesses before the Kefauver Congressional Committee investigating crime without a shiver of dread and without wondering what is going on in this country.

By the same token, no one can read of that other investigation of the scandals in the Reconstruction Finance Corporation, the huge Federal lending corporation, without the same feeling of loss of confidence in and despair of our government leadership. It has been brought out that loan after loan, running into millions of dollars, was made not on its merits but on the amount of influence with and actual bribery of officials. There are dismaying reports of minor employees who lived in Florida's most expensive hotels, and of a secretary on the White House staff who received a mink coat costing thousands of dollars. Other investigations have shown government departments and offices infiltrated with Communists, who are actually publicly sympathized with by high-up officials after they had been arrested.

The Kefauver Congressional Committee has shown that the police and other officials in some of our

*By E. R. Eastman*

American cities received millions of dollars in bribes to protect great gambling and other criminal syndicates.

Yes, the picture is black. Crime and corruption are on the rampage. But there is a silver lining. Through the press, the radio, and television, millions of good American citizens are at last getting the facts, so that they know what is going on. In our American history it has always been the case that while it takes a long time to arouse the people, once aroused they have cleaned the rascals out. And I have faith to believe that they will do the same now.

But as J. Edgar Hoover, head of the F. B. I., so forcibly pointed out just a few days ago, this job of cleaning house must be done by the people themselves back home in the cities and communities where the crime and rottenness exist. This idea of depending upon the Federal government, on confused and sometimes unworthy Federal officials to clean house, will never work.

## MY IDEA OF HEAVEN

LAST NIGHT I dreamed that I was a boy again living in the old farm home with my father and mother and brothers, and I woke with a lump of loneliness in my throat.

Before I went to sleep again I fell to wondering, as all of you often have, what Heaven is like. How anyone got the idea that there were golden stairs leading to Heaven and that the streets were paved with gold, I'm sure I don't know, for my idea of Heaven is quite opposite to streets of any kind. To my mind, Heaven is more like a quiet summer day in this north country of ours, with the apple trees in blossom and a mantle of green spread over the woods and fields.

I am sure that when you think of Heaven, the first thought that comes into your mind, as it does in mine, is of all those whom we have loved here and lost, and of the infinite joy of meeting them again. A poet whose name I do not know has said it better than I:

*Life changes all our thoughts of Heaven:  
At first we think of streets of gold,  
Of gates of pearl and dazzling light,  
Of shining wings and robes of white,  
And things all strange to mortal sight;  
But in the afterward of years,  
It is a more familiar place;  
A home unhurt by sighs or tears  
Where waiteth many a well-known face.  
With passing months it comes more near,  
It grows more real day by day;  
Not strange or cold, but very dear—  
The glad Homeland not far away,  
Where none is sick, or poor, or lone,  
The place where we shall find our own.*

## TRIBUTE TO H. E. BABCOCK

AMONG THE many great contributions that Ed Babcock made to agriculture and to America, the last one he worked on was probably the most important.

With limited energy and failing health, he aroused agricultural and industrial leaders and consumers across America to the great need of better nutrition. As a reader of AMERICAN AGRICULTURIST you will remember that the basis of Ed's nutritional program was animal agriculture, the need to get everyone to eat more dairy, poultry and meat products, balancing these animal foods with plenty of fruits and vegetables.

It is very fitting, therefore, that Cornell University is setting up an outstanding memorial to Ed through the establishment of a permanent endowment in the field of nutrition. This memorial is to be in the form of an endowed professorship, the holder to be the kind of man who can carry forward the whole broad program of better human nu-

trition which Ed started and promoted so well.

To establish this H. E. Babcock Memorial a fund of \$500,000 is now being raised by Mr. Babcock's former friends and associates. Already more than \$200,000 has been contributed to the fund, mostly from sources other than agriculture. Now the suggestion is made—and we of AMERICAN AGRICULTURIST heartily endorse it—that you readers of AMERICAN AGRICULTURIST, whom Ed served so long and so well through his page "Kernels, Screenings & Chaff" and in many other ways, and who his nutritional program will continue to help, will wish to contribute to this memorial fund. Any sum is acceptable. If \$1 is all you can afford, send it along out of your respect and love for a great man and in order to have a share in carrying on his work. But be as generous as you can. Send your contribution to the H. E. Babcock Memorial Fund, Cornell University, Ithaca, N. Y.

## FOR BETTER EATS

IN 1930 the total American frozen vegetable pack was only approximately 100,000 pounds. In 1947 it was nearly 348 million pounds, and last year the figure was higher still. Not only does deep-freezing make it possible to have fruit and vegetables the year round that taste almost as good as when they were harvested, but equally important, says the Medical Society of Pennsylvania, is the nutritional value of frozen foods. Chemical changes take place much more slowly at lower temperatures; therefore, frozen foods undergo smaller losses of vitamin content than those preserved by any other method.

From personal experience, I can testify that in our family we just would not know how to get along without frozen foods. We even have two freezers, and we fill them to capacity with meat and with almost everything that is grown in this climate. Even if you feel that you cannot afford to buy a freezer at this time, the chances are good that you live near a locker plant where you could rent a box and at least have some frozen fruits, vegetables and meats.

One thing further should be said. Nothing can come out of a freezer better than it is when it goes in. It is highly important to select only top quality vegetables and fruit, harvest them at just the right time, and get them into the freezer in the shortest possible time.

## LIGHTEN YOUR LOAD

AGAIN I remind my older farmer friends that if you have a son who is working with you and interested in farming, or if you have a reliable hired man, it's a good bet from both your standpoint and his to take him into partnership with you, or at least to work out some kind of a share-the-profits plan.

Let him take some of the responsibility; use his enthusiasm, listen to his ideas, and shift some of the heavy load from your own tired shoulders to those of a younger man who is ready and willing to help carry it.

## EASTMAN'S CHESTNUT

THE old railroad chestnut stories are still pouring in. Here is one I hadn't heard before which was contributed by three or four different friends. It's not about a slow train, but a fast one:

A man standing on the lower steps of a car leaned over to kiss his wife goodbye. But the train pulled out so fast that he missed his wife and kissed a cow two miles out of town.

Jim Hall says that that's not the right version of that story. The true story is that the man leaned over from the train steps to kiss his wife goodbye and the train pulled out of Camden, New Jersey, so fast that he found himself kissing a girl in Philadelphia.

I didn't question Jim's version because he seemed to be speaking from experience!

# AA's Farmers' Dollar Guide

**I**N FIGHTING a war or preparing for one, which is best, to follow free enterprise or adopt bureaucratic regimentation? A clear, logical answer was given by Frank Pearson of the Cornell Department of Agricultural Economics and Farm Management to a Farm and Home Week audience week before last.

When fighting or getting ready to fight, said Dr. Pearson, three things must be done; (1) **Civilian consumption must be reduced;** (2) **industrial and food production must be increased;** (3) **production must be shifted from civilian goods to war goods.**

Free enterprise lets prices go up. This automatically reduces consumption, encourages increased production, and encourages shifts in production to the things most needed. It also encourages imports.

Regimentation through bureaucracy attempts to keep prices low by ceilings (everyone favors low prices when he buys). To the extent successful, price ceilings **increase** civilian consumption rather than **decreasing** it, and **discourage production by making profits less likely.** Inasmuch as civilian consumption must be decreased to provide for war or defense needs, the next necessary bureaucratic step is rationing. (But no one likes this so Congress delays it as long as possible). Finally bureaucratic government finds production slipping and encourages it through government subsidies. Controls discourage imports because other countries bid above our ceiling for scarce goods.

In shifting production from consumer to war goods, bureaucracy sometimes gets quick results. An auto manufacturer is told to make fewer cars and more tanks and does it. It is less easy to get the desired results from thousands of small businesses and next to impossible to regiment 150 million consumers.

Professor Pearson's conclusion is that the two systems—free enterprise and regimentation—eventually get approximately the same results, **but that free enterprise will get those results faster, cheaper, with less manpower and with fewer mistakes.** Anyway, price controls fool the public. You may buy goods at the old price but you don't get the old quality. Furthermore, government statistics on prices never include black market sales.

You might think of it this way: We and the rest of the public have been told many times about the sacrifices we must make to keep our freedom. Among those who have told us are congressmen who then **immediately take every possible step to fix things so that nobody has to sacrifice anything, so that we can buy at the old prices, work for the same wages or higher, and have all of the necessities and luxuries that we ever enjoyed.**

**WRITE A LETTER:** The man who thinks that congressmen ignore letters is wrong. One letter makes little impression, but dozens, hundreds or thousands of **personal letters**, all in substantial agreement, have tremendous influence. Have you told your senators and congressmen that you expect less spending and more economy and efficiency in government? I have. We can get it if enough of us demand it.

**INTENDED ACREAGES:** U. S. Department of Agriculture is reported as amazed over the smallness of the crop acreage that farmers intend to plant, as recently reported to the Department. **Total figures are sharply below the PMA "suggestions" and 4½ million acres below last year.** The crops where increases are intended are: Corn, 1.6%; spring wheat, 18.1%; tobacco, 9.5%; rice, 19.2%; dry beans, 2%; dry peas, 1.7%. **Decreased** acreage is reported on oats, 5.3%; barley, 13.8%; flax seed, 3.5%; sorghum, 24.4%; potatoes, 14.8%; sweet potatoes, 22.5%; soy beans, 6.3%; cow peas, 13.6%; peanuts, 5%; hay, .01%, sugar beets, 12.4%. Of course, farmers may change their plans between now and planting time.

Among possible reasons for decreased intentions to plant cultivated crops are: (1) labor shortages resulting from draft and competing industrial jobs; (2) price uncertainty resulting from threat of ceilings; (3) rising production costs; (4) unwillingness to forsake grass farming which has proved profitable, and plow up meadows for cash crops which are always more or less speculative.

The result may well be an increased awareness by government of the dangers of a possible food shortage. —Hugh Cosline

## The Song of the Lazy Farmer

**W**HEN cold war starts to gettin' warm, it naturally blows up a storm of drafting boys and building planes and puttin' many other strains upon the whole economy, which always upsets you and me. But things don't really get too bad until the public gets so mad that government decides to try some price controls on things we buy. That may be perfectly all right, but it is always quite a sight to watch the boys in charge sweat o'er the price that farm stuff should sell for. So once again, just like I done back there in nineteen forty-one, I'm headin' down to help 'em out and tell them what it's all about.

Of course, no one's invited me, but I can't stand to wait and see how inexperienced city men might get things all mixed up and then show great surprise when farmers say, "We can't grow this, it doesn't pay." If they'll keep still while I explain 'bout feedin' steers and

growin' grain, it shouldn't take me very long to tell them what they're doing wrong. But even if I have to take a month to get 'em all awake, I'm sure Mirandy (ain't she grand?) will have the spring work well in hand.

**Now—Choose from 3 Great NEW IDEA Mowers**

- each features quick, easy hitch
- each makes clean, square turns

**Brand-New NEW IDEA No. 40 Semi-Mounted Mower**

Easiest handling mower of its type! Readily moved by hand on retractable rollers—hitched to tractor drawbar or mounting brackets by only two bolts. Tough tubular steel frame provides extra strength without excess weight. Cutter bar is fully protected against hidden obstructions by Automatic Safety Release. This new No. 40 offers exceptional cutting ability in heaviest growths—PLUS all-round maneuverability that has no equal. Get all the facts about the all-new NEW IDEA No. 40—the semi-mounted mower that's second to none! Check coupon for detailed literature.

**NEW IDEA No. 30-A Mower—** favored by thousands of farmers. Quickest "on and off" mower on the market. Trails straight and true—with full weight balanced on its own heavy but free-rolling wheels. Power-take-off operated lift and sickle. Special Pitman lock cuts sickle vibration. Described in free folder listed in coupon.

**NEW IDEA No. 30-AH Hydraulic Lift Tractor Mower** Hydraulic power quickly puts cutter bar up or down to any desired height from ground—holds it firmly in position. Send for folder.

Introduction of a remarkable newcomer—the No. 40 Semi-Mounted Mower—puts NEW IDEA's line-up of mowers farther ahead than ever. See them all at your NEW IDEA dealer's. You'll see mower engineering at its farm-proved finest!

**Another reason why a NEW IDEA is a good idea!**

# FARMERS TELL WHY THEY LIKE THE CASE FORAGE HARVESTER

**CHOPPED HAY**, green or wilted for silage, partly or fully cured for barn curing or simple storage, is handled with the clean-raking, gentle-acting windrow pick-up unit. Also salvages combined straw.

**GRASS SILAGE** is cut, chopped and loaded in a single one-man operation by use of the cutterbar unit. It cuts full 4½ feet. Engine attachment (extra) permits fast work with light tractor.

**CORN SILAGE** up to 16 tons an hour can be harvested in good corn by one man with 3-plow tractor. Saves broken and blown-down stalks that too often are missed.

**IT'S SIMPLE**

**IT'S LIGHT RUNNING**

**IT'S FAST**

"I looked over all makes of forage harvester, chose the Case. I am highly pleased with its performance, especially the cutting it does, and with the pick-up," writes C. E. Cross. "Have harvested 110 acres of green grass. Machine operates easier and faster than any," says John Hughes. "We are able to cut finer and put more silage into the same space," says Gregor Barthel. "Simplicity of the machine is an added advantage as to upkeep, and its light running always makes an impression."

The Case Forage Harvester works well with a full 2-plow tractor, faster with 3-plow or larger size. Get full details from your Case dealer.

**PLENTY OF BLOWER CAPACITY TO KEEP AHEAD...**

The new Case Forage Blower has extra capacity to keep ahead of Case Forage Harvester. Big hinged hopper, spring-balanced for easy handling, permits driving straight through—no backing to unload. Power unloader for apron-bottom wagons available as extra equipment.

The three Trouts of Detour, Maryland, and "Old Blessing" who produced 65 lbs. fat and tested 4.2% in December. From left are: Dick, Harry, Sr., and Harry, Jr.

## Visits with Maryland Dairymen

By JIM HALL

MARYLAND men I called on recently in Frederick and Carroll counties keep themselves up-to-date on markets, labor and equipment to face wartime conditions better. They are also keeping as up-to-date in their thinking in regard to their own farm management as in the over-all problems.

For instance, up at Detour, Maryland, I found that Harry Trout and his sons, Harry, Jr., and Richard, had been taking steps designed to give them higher milk production at less cost.

The Trouts joined the D.H.I.A. just last April, and Harry says it is already saving them money because their milk has gone from a 3.5 to a 3.8 test. Some of their black and white grade cows produce 55 to 65 pounds of fat a month on a 1 to 3 milk-grain ratio.

The natural permanent pasture is limed every four years, manured lightly every year and then disced up every fifth year to sow blue grass.

They are able to turn their 35 cows out to pasture not later than the middle of May, and they stay out until the middle of November and occasionally on into December. On their hay land the Trouts sow a little timothy with wheat in the fall, and then in the spring sow a mixture composed of two bushels of alfalfa, one bushel of red-top, and one bushel of alsike at the rate of one bushel to 7 acres.

The Trouts fill a 10'x40' cement stave silo and an 11'x37' tile silo with corn each fall, which rounds out their roughage program of good pasture, good hay, and good silage.

### Pen Stable

The only pen stable I saw in Maryland was on W. Roger Roop's farm at Keymar, but he said there are 35 in the Baltimore milk shed, with 15 more expected this spring.

Roop's whole operation is out of the ordinary. In the first place he's quite an inventor and a whale of a good mechanic. Back in '42 he added 30 feet to the front of his barn and removed all the wooden stalls and walls in order to be able to clean the whole barn with his manure loader. In 1944, '45

and '46 his barn housed "relief" heifers while awaiting shipment overseas in the Church World Service Program. After that he bought 14 purebred and six grade Holstein heifers out in Iowa and now is on his way to building the herd up to between 40 and 50 head.

Roop has a combine, field chopper, and three self-unloading wagons that he built himself to handle his own work and much custom work for neighbors. For silage he just stacked a pile of third cutting alfalfa and timothy outside and had only 8 inches of spoilage

Roger Roop built 3 of these false bottom wagons. An electric powered spreader unit in the bottom unloads grain or chopped roughage.

around the edge. He backs a wagon load of it to the south side of his pen stable, and cows go out and help themselves to 40 lbs. a day each.

He raises his own soybeans, wheat, oats, barley and corn — just buying salt, lime and steamed bone meal to make his own grain ration. His grain bins hold 2,200 bushels, and pipes lead from them to his Hammermill, on to his mixer and from there to the feed box. He handles none of it by hand.

In his 4-stall tandem milking parlor, which he built out of pipe and concrete, he installed grates over drains in each stall. This stops splattering, and when milking is done he just hoses all drop-pings down the drain.

Mr. Roop hired the masonry work done for his milking house and milking parlor, but did all the rest of the work himself. The open side of the passage between the two structures is required by Baltimore health regulations.

## "Greatest thing since the Milking Machine"

That's what **GREGORY THEW**, Orange County Dairyman, thinks of the **G.L.F. STABLE CLEANER**

**T**HERE are 50 cows in Greg Thew's modern barn at Campbell Hall, New York—25 on a side. When it comes to cleaning the two 96-foot gutters, Greg says: "There's nothing to it with my G.L.F. Stable Cleaner. It saves a lot of darn hard work. I can load a 90-bushel spreader and have the belt back in place in less than 5 minutes by just pushing a switch. It saves a lot of time, but to me its biggest value is in the hard work it saves. For labor-saving devices, I put the G.L.F. Stable Cleaner right next to the milking machine."

### Farmers Helped Build It

The G.L.F. Stable Cleaner is the product of more than two years of practical testing and development on dozens of farms.

Engineers in the G.L.F. Farm Supplies Division set out to find a way to take the back-breaking work out of the meanest, dirtiest job on the farm. The earliest models were installed in dairy barns where farmers used them under day-to-day working conditions.

By operating these cleaners day after day, watching for "bugs" in operations, trying out ideas, making changes, the new G.L.F. Stable Cleaner was developed. Its simple, rugged construction and ease of operation are the result of practical farm thinking coupled with sound engineering.

### Easy to Install

Ease of installation is one of the main reasons farmers like the G.L.F. Stable Cleaner. It is so designed that there's no need for expensive remodeling. Any farmer who has one will tell you, "You don't have to tear your barn apart to put in a G.L.F. Stable Cleaner." If your gutters are at least 14

inches wide, straight, and in good condition, anyone can do the small amount of concrete work necessary to prepare your stable for the cleaner.

The G.L.F. Stable Cleaner is delivered assembled and ready to use. The cows can stay right in the barn while it's installed!

### Simple, Rugged Construction

There are no chains, tracks, paddles, gears or any kind of metal in the gutter. A flat belt especially fabricated to resist acids and withstand abrasive wear is *all* there is in the gutter.

The chute outside the barn to convey the loaded belt to the spreader is made of highly rust-resistant, hard alloy steel which has twice the strength and six times the corrosion resistance of ordinary steel.

The heavy duty motor takes a heavy starting load with ease and is directly coupled to the speed reducer to provide full, positive power even when exposed to the weather.

### Two Models

You'll need Model 500 if your spreader box will be above the gutter level. This unit rolls easily on

wheels to serve two or more gutters and can be wheeled out of the way when a clear barnyard is needed.

Model 300 is for use where the spreader box is at or below the gutter level.

The G.L.F. Stable Cleaner will soon be available through G.L.F. Service Agencies. Ask about it. Particularly if you're planning a new barn or changes in your present one, plan to include the G.L.F. Stable Cleaner as part of your basic equipment.

Cooperative G.L.F. Exchange, Inc., Ithaca, N. Y.

A **STRAIGHT GUTTER** is the one requirement for installation. Here the gutter has been cleaned and the belt is being returned. In case of power failure, there's nothing in the gutter to get in the way of a shovel.

# 21 Years of De Laval Combine Milking

Grover G. Meyer and Sons, Basehor, Kansas, installed this De Laval Combine Milker in 1930 in their milking parlor built in 1925 and said to be the first in the U. S.

**"BEST IN MILKING"**

Says  
Grover G. Meyer  
and  
Sons

Recently Grover G. Meyer and Sons installed this new De Laval Combine in their new milking parlor because 21 years of experience convinced them it was "the best in milking".

In 1925 Grover G. Meyer and Sons, Basehor, Kansas, built what is said to be the first milking parlor in the U. S. For five years they used a De Laval pail-type milker in their original milking parlor and in 1930 installed one of the first De Laval Combine Milkers to be placed in operation.

They have recently built a new milking parlor and installed a new De Laval Combine Milker. Mr. Meyer writes:

"We have had a lot of pleasure and satisfaction in using this milker and certainly, after 21 years of operation and experience with this type of milking, we would not have placed another De Laval Combine Milker in use if we did not think it was the best in milking."

Learn the facts for yourself about the De Laval Combine Milker—the original milker of this type—and the only one with 21 years of successful milking experience behind it on hundreds of farms.

A typical Meyer Holstein—Madge Speckel Aurora, No. 2336226, a member of their all-registered Holstein herd. She is classified "Excellent" and was All-Kansas cow in 1947 and 1948. Production at 7 years, 8 months, in 321 days, was 18,365 lbs. milk and 689.1 lbs. fat, 3.8%. Record made on twice-a-day milking under Holstein-Friesian Association of America supervision.

## Faster Milk Cooling...at Lower Cost!

with the DE LAVAL SPEEDWAY

### MILK COOLER

Engineered for trouble-free, dependable service, long life and most efficient cooling. The cooling coil is immersed in the water within the cabinet. Compressor mechanism and motors are outside. Entire unit hermetically sealed against dirt, dust and moisture. Refrigerant sealed in. The entire Cooling Unit is easily removable.

SEE YOUR DE LAVAL DEALER TODAY

IF EVERY mother in the Northeast could see "Nip" and "Tuck", milk consumption would jump overnight. Nip and Tuck are two white rats prominently displayed in an exhibit by the American Dairy Association and the National Dairy Council in Warren Hall during Farm and Home Week at Cornell.

Both rats were born on January 30, but a month later one weighed 18 grams, the other 89. Both had the same feed but not the same drink. The little one drank nothing but "cola" while the big one drank nothing but milk. It was a startling and convincing exhibit.

In addition to being of financial benefit to dairymen, increased milk consumption would benefit the nation through better health. All right, whose job is it to tell the consumers about those rats and about all the other evidence that has been collected about the connection between milk and health?

### Good Investment

Some say let the dealers do it by advertising! To a considerable extent they are advertising, but the producers are the ones who will profit most from milk publicity. In the Northeast every pound of milk out of every 100 pounds that is sold as fluid milk rather than made into butter and cheese raises the price to the producer by 5 cents. Anyway, if the producer doesn't do his part of the job no other individual or agency is going to do what really needs to be done.

Something is now being done by producers. Two years ago the New York State Farm Bureau Dairy Commodity Committee met in Ithaca and looked the facts in the face, including higher production and lower consumption. Then they called a mass meeting in Syracuse on April 25 which resulted in the organization of "Milk for Health" with headquarters now at 119 South Cayuga Street, Ithaca, N. Y. The chief purpose of "Milk for Health" is to convince dairymen of the wisdom of contributing 1 cent per cwt. of milk produced in order to advertise and publicize milk. It was agreed that of the amount raised, five-twelfths would go to the American Dairy Association which for some years has conducted an advertising program for milk and its products and that seven-twelfths would go to local Dairy Council units as organized. These Dairy Councils work with doctors, nurses and schools, and in markets where Dairy Councils are active the dealers match the money contributed by the dairymen.

### Making Progress

"Milk for Health" is headed by Jacob Pratt, a well-known dairyman of Schaghticoke, N. Y. Here is a recent statement by Mr. Pratt showing some of the progress made to date:

"With the active support of the American Dairy Association, the National Dairy Council, all of the major farm organizations and the cooperation of the extension services in New York, Pennsylvania, Vermont and New Jersey, considerable progress has been made. Ten thousand dairymen in our up-state New York markets are already making payments.

"Six National Dairy Council units

have been established. These are in Syracuse, Utica-Rome, Capital District, Poughkeepsie, Binghamton, and Elmira. Thirty-five thousand dairymen shipping to the New York market have pledged their support. "Milk for Health" is receiving about 400 authorizations per week from the fourteen thousand dairymen in the New York market who have not yet signed authorizations.

"Distributors in the six council markets are contributing and are giving excellent support, and leading dealers in other markets are ready to do their part. Dealer meetings are now being held in the New York City market, and it is hoped that a Dairy Council unit can be organized there in the near future.

"The 'Milk for Health' program is in the public interest. The support it is receiving from dairymen, distributors and public agencies is a clear indication that this is true. Nutritionists are continually pointing to the need of greater use of dairy products in our diet. The program will benefit the dairy farmer and the distributor. It is an industry program in which we all need to do our part. Much depends on the completion of the sign-up in the New York market and the organization of a Dairy Council in New York City, the greatest milk market in the world."

### Tell Your Neighbors

As might be expected the "Milk for Health" program has more support in some counties than it has in others. Without mentioning names, one of the good dairy counties of New York State has over 2,000 dairymen who are now contributing their 1 cent per cwt. Another dairy county not quite as large or quite as specialized in dairying but still an important milk producing county has only 157 dairymen giving their support. The difference is mostly due to the fact that in some counties dairymen who are thoroughly convinced of the importance of "Milk for Health" have been telling their neighbors about it while dairymen in some other counties have not.

These days there is tremendous competition for the consumer's dollar. The evidence that the spending of this dollar is influenced by advertising is overwhelming. No sizable business concern would consider doing business without a regular appropriation for advertising. The only way that milk can be advertised regularly is through a planned budget. The size of the budget is determined by the percentage of all dairymen who agree to the deduction of 1 cent per cwt. from the milk they produce.

Commercial firms never question the fact that advertising pays, but it is extremely doubtful that any of them can show the tremendous returns that are possible with dairymen if consumers drink a pound of milk more out of every 100 pounds that would otherwise go into butter and cheese. That increases the price of all the milk produced in the area by 5 cents a cwt. The results secured by "Milk for Health" have been excellent, but it seems that this spring is the time to finish the job. Won't you help by "signing up" and by persuading your neighbors to do the same?

# More Chicken...

A booming broiler industry adds a billion and three-quarter pounds of "eating" for the nation's consumers

Up to 30,000 birds in many a broiler house.

Broilers are processed by mass-production methods.

It is probable that even to agricultural producers themselves the growth of poultry raising in the United States is news. News worth our reporting and your reading.

Last year America's poultry farmers produced one and three-quarter billion pounds of broilers. With turkeys and other poultry added on, 1950's production of poultry meat equalled half of our beef production.

Not many years ago broilers were the cockerel half of replacement chickens for the laying flock... sold for meat. Quality varied greatly. Some were light, some heavy; some young, some old; some tender, some tough. Supply was seasonal, and consumer demand feeble.

But today, broiler raising is a fast-growing, mechanized, mass-production industry with an established mass market. And a mighty efficient industry, too. Special broiler strains have been developed—plump, meaty birds that grow into 3-pound broilers in 10 to 12 weeks—and make a pound of chicken meat from 3 pounds of feed or less. In a modern broiler house, one man can handle up to 30,000 broilers, up to four times a year. Thus, one man can turn out as much as a half-million pounds of meat in one year.

Starting on the East Coast's Del-Mar-Va (Delaware, Maryland, Virginia) peninsula, broiler growing has spread all over the nation—to New England, the South—to the Midwest, the Southwest, Pacific Coast. It's still growing lustily. So long as Mrs. Consumer says, "More chicken, please," it will continue to grow—as long, also, as ingenious, self-reliant American producers see the possibility of profitable food production via broilers, even in marginal areas—of sharing in a business which last year accounted for four hundred and fifty million dollars of our nation's farm income.

## Martha Logan's Recipe for

### HUNGARIAN CHICKEN

1 chicken, cut up for frying	3 medium onions, diced
1/2 cup butter or shortening	1 teaspoon paprika
Salt	1/3 cup water
Pepper	1 cup cream

Hot cooked noodles or rice

Rinse chicken pieces in cold water and dry. Melt butter in heavy skillet; season chicken pieces and brown on both sides. Remove from skillet. Add onions to skillet and fry slowly until tender. Return browned chicken pieces (skin side up) to skillet and sprinkle with paprika. Add water and cover. Cook slowly for 30 to 40 minutes or until tender. Remove chicken pieces to platter. Add the cream to skillet mixture. Stir and heat thoroughly. Serve with cooked noodles or rice.

### OUR CITY COUSIN

When Biddy is broody, She's sharp with her beak. City Cousin found out on a visit last week.

## Production vs. Price Controls

Meat price controls are aimed at helping to curb inflation. We can all sincerely hope that they will succeed in this. Swift & Company will abide by these controls.

On the other hand, I think there's a better way of doing our part in controlling inflation. I refer to the program worked out together by farm and ranch organizations, various meat packers, and others. This broad plan was presented to the government. It aims directly at curing the cause of inflation—too much money bidding for too little produce. Here's what our livestock-meat industry proposed:

*First, encourage an increased supply of meat.* What we need is more livestock, not less. Do everything possible to induce ranchers and farmers to raise more and better meat animals. Encourage them, also, to produce more feed and to use it efficiently. Reduce livestock death and injury losses. All those things can be done. They all mean more meat.

*Second, take steps so there won't be so many inflated dollars around bidding up prices.* That, too, can be done. By pay-as-we-go taxation. By cutting down on too-easy credit. By encouraging savings. By holding down the expansion of the supply of money. And by strict economy—in government, business and individual spending. All those are strong checks against inflation.

*The results would be certain.* More meat, fairly distributed. The efficiency of maximum production—which we need. No loss of precious medicines and other by-products. Normal, aboveboard business instead of black market graft and waste. And a safe and sound economy for our nation both during and after this emergency. I would like to know what you think.

**F.M. Simpson.**

## Quote of the Month

"No one should be blamed for making a fair profit. If it were not for profit, there would be no incentive to do business. Who wants to work for nothing? We would not have any markets that were good if we did not have financially responsible concerns."

Charles Moss, Tennessee Livestock Farmer

## Tomorrow's Dairy Barns Today

by Professor S. A. Witzel  
Agricultural Engineering Dept.  
University of Wisconsin

S. A. Witzel

Imagine, if you can, a dairy farmer taking it easy! Even with a herd maybe 1/2 larger? The new-type self-feeding, loose-housing dairy barn is the answer. Such a layout will be well filled with grass silage and sun-dried alfalfa, all harvested with a field chopper and finished with heated air. That way you'll save all the feeding value, the proteins, the vitamins, the stored up sunshine for winter feeding of cows and young stock. Self-fed from silo and self-feeding hay mow, it's not much work. And the bedding can be stored directly above the bedded area. With tractor and power loader there's no problem to keeping the bedded area clean.

Now for the milking plant with its elevated stalls for milking. Here the cows are milked in a position where the operator can see what he is doing. No stooping, no squatting, no milk to carry if you install a releaser system. No need to retire from a dairy farm like this because of drudgery. And the cost of operation is reported to be 1/2, 1/2 or even less.

Experiments over a nine-year period reveal that high-producing cows continue to milk well under cold, loose housing conditions. And they apparently are in better health with production equal to or perhaps a little better than the check herd in the stanchion barn. The new-type dairy plant is certainly more sanitary. You have a clean place to milk the cows, better herd health, better udder health, and better controls all along the line.

## Soda Bill Sez...

What we need today is the common sense of our common men—not the wisdom of our wise men.

People who are always gazing into a crystal ball are apt to get all balled up.

## Run YOUR Own Public Business

(Continued from Page 1)

was attended by 15 to 20 people, just like the school and town meetings are now. Today, farm meetings are attended by hundreds! Just this winter I attended two local farm meetings at Ithaca, and at both of them over 500 people were present.

How did this come about? In the first place, a real effort is always made to publicize the meetings, to let people know when and where the meeting will be, and, especially, that there will be an interesting program. Farmers have learned that their meetings are well worth attending. At both of the local meetings I mentioned above, a nice luncheon was served. There's nothing like breaking bread together, and those luncheons weren't too costly, either. In the afternoon the business of the meeting was presented with reports and charts, in such a clear manner and in so much detail that every person in the room knew just what his organization had been doing during the past year and what it proposed to do for the coming year. At both meetings there were excellent short speeches, good entertainment, and a lot of fun.

### Good Meetings are Planned

Those two meetings and hundreds of other successful farm meetings like them don't just happen. They take planning, good organization, and a lot of work. There is no reason why we cannot do the same with our school, our town and other local meetings that so vitally concern every one of us. To be sure, it will take time. It has taken the farm organizations a long time. Maybe your first well planned and organized meeting will not be well attended. But if those who do come are pleased with the meeting, they will come next time and bring others.

### A Suggested Program

Here is a suggested program for the annual school meeting in New York, which is held on the first Tuesday in May, except in certain union and central school districts which have voted to hold the annual meeting the first Tuesday in July.

This suggested program can, with modifications, be used in local school or town meetings in states other than New York.

This type of program has brought about large attendance and successful participation by the people themselves in local farm meetings of different farm organizations.

#### I. GET THE PEOPLE OUT

Use the local newspapers, the radio and the telephone. Tell them that you are going to have the best school meeting in the history of the district. Then make good on that promise as follows:

#### II. DINNER

Can be served in the school cafeteria or in any other suitable place.

May be served by students or by some local church organization. With proper planning it need not be expensive.

The dinner should be served early enough so that the school meeting can start exactly at 7:30 p. m., the time required by law in New York State.

If desired, an afternoon program could be set up where many school matters could be discussed informally, followed by a dinner and the annual legal meeting, with reports, at 7:30.

#### III. ENTERTAINMENT

Many schools now have excellent orchestras and bands. The band or orchestra could well open the meeting, and play several times during the program.

Plan for a good song leader and warm the crowd up with some good

### QUALIFICATIONS OF A VOTER AT SCHOOL MEETINGS IN NEW YORK STATE

#### A VOTER MUST:

1. Be a citizen of the United States.
2. Be at least 21 years of age.
3. Be a resident of the district for a period of at least 30 days preceding the meeting at which he or she wishes to vote.

In addition to the above, all voters must have at least ONE of the following qualifications:

1. Must own, lease or hire real estate subject to taxation within the district. (Where the deed or lease is joint, both persons may vote.)

OR

2. Must be the parent of a child or children of school age, providing such child or children shall have attended the district school in the district in which the meeting is held for a period of at least 8 weeks during the year preceding each school meeting. (Both father and mother may vote.)

OR

3. Not being a parent, has permanently residing with him or her a child or children of school age who shall have attended the district school for a period of at least 8 weeks during the year preceding such meeting. (In this case, only the head of the household may vote.)

community singing.

Frequently, local farm leaders hire an entertainer who may make a short humorous speech or they provide some entertainment with magic, or a radio singer, or a comedian.

#### IV. BUSINESS

Follow the above, or alternate it, with carefully prepared reports by the officers of the district, with an outline of plans for the coming year. Make sure that there is plenty of time for discussion. Both voters and officers should be careful to keep antagonisms and personalities and unfair criticisms out of their discussions. There is just one and only one reason for the existence of the schools; that is to help boys and girls.

#### Duties and Powers of Officers and Boards at School Meetings

**CALL TO ORDER:** The meeting should be called to order by one of the trustees or members of the board.

**ELECTION OF CHAIRMAN:** Some inhabitant should nominate a qualified voter of the district as chairman of the meeting, and the person calling the meeting to order should put the motion.

**CLERK OF MEETING:** The district clerk should act as clerk of the meeting. If he is not present, a clerk of the meeting should be elected by the voters present.

**RECORD OF MEETING:** The clerk of the meeting should keep an accurate and complete record of all the proceedings of the meeting, and should enter in the record in full all motions and resolutions voted upon, and should state the vote upon each such motion and resolution.

**OFFICERS AND COMMITTEE REPORTS:** After organization of the meeting there should be a complete report in writing by the trustees or boards of education, the collector, and the treasurer.

Here is an opportunity for the officers to use charts or in some other

or engine operation  
by A-C auxiliary  
motor.

## Easy BALES IT

Easy on your hay... easy on you. That's the Allis-Chalmers labor-saving way of baling with a home-owned ROTO-BALER.

Your ROTO-BALER rolls the hay, without pounding or shattering, into weather-resistant bales that cannot buckle. Bales that stand rough handling in hauling, storing or shipping, and nestle compactly together in less space.

Best of all is the satisfaction of seeing livestock lick up every leaf and fine stem from rolled bales fed whole, or unrolled down the feedway.

Those high-protein green leaves are money to you. They are more milk in the pail. More meat on the scales. More value in the hay buyer's eyes.

Priced for home ownership, the ROTO-BALER and its running mate, the Power Rake and Tedder pioneered by Allis-Chalmers, capture the nutritive goodness of hay at just the right stage of blossoming. Together, they give you the good feeling of having your hay in leaf-tight bales, safe from the weather.

*ROTO-BALER is an Allis-Chalmers trade-mark.*

## More Home Grown Feed from OATS and BARLEY

By A. A. JOHNSON

Department of Plant Breeding,  
Cornell University, Ithaca, New York

THIS year it's to every dairyman's interest to grow economically a maximum amount of home grown feed. As the spring planting season approaches all dairymen will be looking to each crop for means of increasing production. Oats occupy more acres on the average farm of the Northeast than any other spring planted crop, and in terms of total production oats is our most important home grown grain crop. Barley acreage has decreased somewhat during the past few years; nevertheless, dairymen are looking for means of improving barley production.

There are at least four practices that have an important influence on oat and barley yield and which are controlled in whole or part by the dairyman growing the crop. These are (1) choice of variety, (2) quality of seed, (3) rate of fertilization, (4) time of planting.

### Oat and Barley Varieties

The CLINTON and MOHAWK oat varieties are planted on about 80% of the oat acreage in New York State. They have several desirable features which account for their great popularity. Both are outstanding in stiffness of straw and are thus especially well suited to production of high oat yields on fertile dairy farms. Most oats are combined in the Northeast; hence, stiff-strawed varieties are best where lodging is apt to occur. The Clinton and Mohawk varieties have heavy meaty kernels high in feeding value. They are also relatively early in maturity.

The ADVANCE oat is similar in breeding to Clinton and Mohawk but is four to six inches taller and two to four days later maturing. It is recommended where an oat is desired which grows more straw than provided by Clinton and Mohawk and where lodging is not a severe problem.

AJAX is recommended for dairymen desiring a mid-season oat which has high yielding ability and a tall straw. Ajax is markedly inferior to Clinton and Mohawk in strength of straw and should be grown only on soil where lodging is not a problem.

GOLDWIN and VICTORY are similar to Ajax in most important respects.

Oat diseases are an important factor in oat production. Clinton, Mohawk, and Advance are susceptible to Race 45 crown (leaf) rust but resistant to other common races of rust. Ajax and nearly all other mid-season oat varieties are partially resistant to Race 45 but highly susceptible to all common races of leaf rust.

It is not possible to predict whether rust will become generally damaging to oats in 1951. Based on past experience, Clinton, Mohawk, and Advance are the best varieties. However, on farms where these varieties have been severely damaged by rust, farmers are advised to choose varieties of different breeding, such as Ajax.

There are two varieties of barley recommended for spring planting. These are ALPHA and MOORE. Alpha is the old stand-by in much of the Northeast. Moore, a smooth awned, six-row, stiff-strawed variety developed in Wisconsin, is a recent addition to recommended barley varieties. It is superior in yield and stiffness of straw to Wisconsin 38 and Bay.

Each year more dairymen are looking to the professional seed supplier

# Killing Weeds The Easy Way

By JOHN VAN GELUWE

**W**ALKING up to a farmer last summer whose corn field was knee high in weeds, I asked him if he ever thought of spraying the weeds with 2,4-D. "Well," he said, "I have heard about these new chemical weed killers but I just figured that learning to use them was too technical and complicated for a farmer." I explained that such was not the case; that chemical weed control practices are as simple as most fertilizer schedules and easier to learn than most insecticide and fungicide spray schedules.

The principal need today is not for more or better chemicals for weed control; they are coming all the time. The principal need is for more information on the correct use of existing materials, and a realization that weed control methods are not complicated. Chemical weed control is becoming more and more important as labor becomes scarce and new chemicals and spray equipment are developed. The modern farmer is going to find that to keep up with his neighbor he is going to have to incorporate chemical weed control into his farming practices.

Chemical weed control has been a real boon to farmers in the wheat belt. Twenty-five million acres of crops were treated with 2,4-D in 1949. 2,4-D is probably the best known of all chemical weed killers. It is very effective in controlling broadleaved weeds and some annual grasses in corn, grains not seeded to legumes, grass pastures and hay fields. It is also effective in controlling wild onion and garlic in wheat and pastures. An acre of grain or corn can be treated with 2,4-D for as little as 40 cents worth of it. This is a very economical method of weed control.

New and improved weed killers are constantly being developed. Several very important new materials will be placed on the market during the 1951 season.

### Beans

New water soluble dinitros have been developed especially for pre-emergence weed control in beans and will be made available in some areas under the name "Sinox PE." These materials can be used for weeding snap, dry field and lima beans. Extensive tests have proved that these materials are very effective in controlling broadleaved weeds for 5-6 weeks and annual grasses for 4-5 weeks after application.

Bean growers will welcome these materials, for of the 150,000-200,000 acres of dry beans grown in the Northeast, many acres are abandoned because of excessive weed growth. Field beans being a so-called "low value" crop cannot afford expensive methods of weed control, such as hand pulling or hand hoeing of weeds. With present day labor costs, water soluble dinitros fit into this picture very well. If the grower wishes to cultivate between the rows during the effective period of the pre-emergence treatment, he can apply the pre-emergence weed spray in a 12-inch band over the row only. By this method, weeds in the row are controlled by spraying during this period. Those between the rows are controlled by normal cultivation.

The spray should be applied 2 or 3 days before the beans emerge for best results. With late planted beans, this means spraying soon after planting.

### Strawberries

Hand hoeing and weeding of strawberry plantings is another expensive

operation. There has long been a need for a material that would successfully control weeds and grass in strawberry plantings. Sodium 2,4 dichlorophenoxyethyl sulfate, sold under the name "Crag Herbicide 1," has proved very effective in controlling weeds in strawberries. This material acts on germinating seedlings only, so it must be applied just as weed and grass seeds are germinating and before they reach 1/2 inch in height. A suggested practice is to cultivate the planting and then apply Crag Herbicide 1 just as the weed and grass seedlings start to germinate. This first application can be followed by subsequent applications as necessary. This material should not be applied during the harvest season.

### Sweet Corn

In addition to strawberry plantings, Crag Herbicide 1 is being suggested for trial use on early maturing sweet corn varieties and on sweet corn growing on light, sandy soils. Sweet corn growing on light, sandy soil cannot safely be weeded with 2,4-D. Crag Herbicide 1 fills the need for a pre-emergence weed chemical for corn on this type of soil. From 1 1/2 to 2 pounds per acre of this material has given excellent results.

### Asparagus

Asparagus beds are notoriously weedy areas. By treating with Crag Herbicide 1 after disking and as weeds are germinating, very successful weed control has been obtained. This offers a new and effective method of weed control in asparagus beds.

### Thorn Apple and Brush

Brush growing in fencerows, along roadsides and in pastures is a continual problem to farmers. In the past many laborious hours were spent in cutting and disposing of brush, only to have regrowth within a few months. In fact, cutting of thorn apple causes a continual spread of this "pest" in pastures. The development of new hormone type brush killers has been a blessing to farmers. Brush and thorn apple can be eradicated by spraying during the dormant season with a mixture of 2,4-D and 2,4,5-T.

Treated thorn apple and other brush should be left standing for at least one year to allow the materials to move down into and kill the roots. This gives permanent control of treated brush. Brush killers are especially effective in controlling thorn apple, chokecherry and poison ivy infestations.

This very brief look at some of the newer products should encourage farmers to investigate actively the weed and brush killers now available. There is a place for economical and labor-saving use of weed control chemicals and brush killers on every farm in the Northeast.

Chemical weed control will not completely replace cultivation. It will reduce the number of cultivations necessary and at the same time do a better job of controlling weeds that are always competing for soil moisture and nutrients. Chemical brush control has many advantages: it saves time and labor, it can be a year round operation, and it is more effective than hand cutting.

In the future as new chemicals and methods of weed control are developed, northeastern farmers will find that they must incorporate these methods into their farming practices if they are to maintain their lead in agriculture.

## Protect the PROFIT POINT

## Run YOUR Own Public Business

(Continued from Page 10)

way to make the reports interesting and worthwhile.

Following the officers' reports should come the report of special committees, if any, with opportunity for full explanation and discussion.

**ESTIMATES AND BUDGETS:** The trustee or trustees should report to the meeting the amount of money estimated to be necessary to be raised by taxes during the ensuing school year beginning July 1, for such purposes as payment of teachers' wages, after deducting the amount of public monies apportioned to the district; for the school district library; for fuel and lights; for service of janitor; for insurance of the schoolhouse, furniture, etc.; for repairs, if any are necessary, to the schoolhouse or furniture; for the fees to be paid to medical inspectors; for the installation, repair and maintenance of toilets, and for keeping the same in a sanitary condition; and for such other purposes as are authorized by law.

All votes involving the use of money or authorizing the levying of taxes shall be by ballot or ascertained by taking and recording the ayes and noes of the qualified voters attending.

Among other important powers of the voters at school meetings is the right to vote to provide for the transportation of pupils to schools either within or without the district.

Plenty of time and opportunity should be provided also for informal discussion of any subject which bears upon the problems of maintaining the school.

It should be emphasized, also, that in addition to the powers of the school meeting, the trustees or boards of education elected by the voters have many important duties and responsibilities such as hiring the teachers, determining their salaries within the limits of state law, and in general administering the multitudinous affairs of the district.

In recent years some of these duties have been somewhat restricted, mostly by laws passed by the New York State Legislature, and have been lost to the districts—for one reason because the voters themselves have not attended meetings and taken part in school affairs and have not seen the dangers of losing "grass roots" control.

### Conclusion

In conclusion I would like to emphasize also that most of the facts set forth in this article about the need of voters taking more interest in their schools applies equally well to local government business. The town meeting ought to be one of the biggest and most important meetings of the year. Most meetings of the school boards and of the town boards and the county boards of supervisors are open to the public—or should be—and every one of these regular meetings throughout the year could well be attended by a changing list of citizens. They would thus become familiar with local government procedure and be in position to work with the town boards, the county boards of supervisors, and the boards of education, thereby strengthening our local units of government and keeping our rights and liberties where they belong—at the grass roots.

While the laws and the procedure for these local meetings differ in New England, New Jersey and Pennsylvania, the fundamental principles are the same, and I call upon all of our readers, upon local officers and local educational and political leaders to unite with AMERICAN AGRICULTURIST and other leaders such as that fine organization "Freedom on the March," to save "grass roots" government!

# Save Animals from Bacterial Diseases

THE EASY, LOW-COST WAY

Time-Proved, Reliable

# SULMET\*

SULFAMETHAZINE

*Lederle*

Fast-Acting, Effective in Avoiding Losses  
from

PNEUMONIA • CALF DIPHTHERIA • METRITIS  
BACILLARY ENTERITIS • CALF SCOURS • FOOT ROT

Stop losses from costly bacterial diseases among cattle, swine, sheep and horses by using SULMET Sulfamethazine Lederle promptly after diagnosis. Once-a-day treatment is effective. Return to normal feeding often follows one treatment.

Use SULMET Sulfamethazine in treating acute septic mastitis, in addition to udder infusions of AUREOMYCIN Crystalline OINTMENT Lederle.

Available in six dosage forms: POWDER, TABLETS, OBLETS,\* TINTED EMULSION (for pink eye bacterial infections), SOLUTION 12.5% (for drenching), and INJECTABLE SOLUTION (by, or on the prescription of, a veterinarian).

Your veterinarian is your dependable ally in the constant war against disease. Consult him for the most effective management practices and disease-control procedures to meet your individual needs.

# Seen at Cornell FARM and HOME WEEK

**ELMER MILLER** of Trumansburg (shown below) receives first prize of a sterling silver sandwich tray and \$10 in the Philip W. Pillsbury Award for the best wheat grown in New York State in 1950. The award was presented during Cornell's Farm and Home Week, and judging was by members of the plant breeding department.

Aside from using certified Yorkwin seed, Mr. Miller does not employ any unusual methods. His sample was noteworthy for its uniformity, color, and condition; purity and germination were both 99.9 per cent.

He also placed first in the State in 1949, and his sample won second prize in the soft white wheat class in the national competition at Minneapolis.

Second place in the State this year went to Dwight Minster of Scottsville who grows Cornell 595.

Any wheat grower 18 years or over,

Don MacKenzie of Geneva (above) displaying the technique that won for him the title of New York State Champion Sheep Shearer at Cornell's Farm and Home Week. Judging included shearing time, manner of handling animal, absence of cuts, condition of fleece, and other points.

caught the eyes and held the attention of the thousands of women and girls who thronged the halls of the New York State College of Home Economics during the four interest-packed days

actively raising at least 20 acres, may submit a one peck sample of a variety considered eligible by the Crop Improvement Association in the State to compete in the Award.

— A. A. —

## COLORFUL MEALS

HOW to keep the bright colors of vegetables as they cook was demonstrated to Farm and Home Week visitors by Mrs. Isobel Searls, Cornell foods specialist. She gave these rules: When peeling vegetables, use a sharp knife so peelings will be thin; don't soak vegetables; cook in small amount of boiling water for as short a time as possible; serve at once.

Mrs. Searls' demonstration of "Colorful Meals" was just one of many which

Professor Myron Lacey, left, presenting a plaque to William Hoy, Manager of Sunday Anne Farm owned by L. W. Hooker of Hornell, winner of the 1950 New York Beef Production contest.

Qualifications of the contest were to wean 90% of the calf crop, to grow them to a weight of 500 pounds in 225 days and that some of them should grade choice. Hooker and Hoy placed first by raising a 100% calf crop to a weight of 409 pounds in 156 days with an average grade of choice.

# More Home Grown Feed from Oats and Barley

(Continued from Page 11)

and seed grower for their oats and barley seed. This is a good practice. The professional who makes a specialty of growing, cleaning, treating, and testing seed, furnishes better seed than the dairyman who plants poorly cleaned, untested seed from his feed bin. Highest quality seed costs but little more per acre than "just seed" and most dairymen find seed a poor place to economize.

Certified seed of recommended oat and barley varieties is available from local seed suppliers in record quantities for spring planting. Certified seed is top quality seed. It is generally of highest varietal purity, being virtually free from mixtures of other varieties and crops; it is carefully cleaned to remove weed seeds and inert material. It is high in germination and almost always treated with a dust fungicide. Certified seed must, both in the field and after recleaning, meet the minimum requirements of the official seed certifying agencies such as the New York Certified Seed Growers' Cooperative, Inc.

## Rate of Fertilization

Widespread usage of exceptionally stiff-strawed varieties such as Clinton and Mohawk provides the opportunity for dairymen to grow higher yields of oats per acre by increased application of nitrogen fertilizer. Experiments conducted by the Departments of Agronomy and Plant Breeding of Cornell indicate that on all but the most fertile soils thirty pounds of nitrogen fertilizer can be applied without danger of much lodging and with an expected yield increase of from ten to fifteen bushels per acre. This is an economical means of increasing home grown feed.

On extremely fertile soils, where lodging with even the stiff-strawed Clinton and Mohawk is apt to be a problem, less nitrogen should be applied. Weaker strawed varieties like Advance and Ajax should be fertilized with not more than twenty pounds of nitrogen on soils of ordinary fertility.

An application of 375 pounds per acre of an 8-16-8 fertilizer or its equivalent will provide the recommended rate (30 pounds) of nitrogen for Clinton and Mohawk on most soils of the Northeast. This rate of fertilizer application will also furnish the needed minerals for the seeding on most soils; on low potash soils a 1-2-2 ratio such as 8-16-16 should be used.

Under high rates of nitrogen fertilization, it is recommended that not more than one and one-half bushels of oats be planted per acre.

## Time of Planting

The earlier oats and barley are planted after a good seed bed can be prepared, the higher the expected yield. In date of planting tests conducted by Cornell, oats or barley planted in early May yield less than plantings made in mid to late April.

Some years, adverse weather conditions prevent oat and barley planting by May 15. For such late planting conditions there is a prevalent opinion among farmers that barley or barley and oats mixed will produce more feed than oats. This is contrary to results obtained in Cornell experiments where when present day oat and barley varieties were used in date of planting tests the acre yield of barley fell off faster than oats. As a three year average, oats planted in late May produced 60% as much as plantings made in mid-April as contrasted to barley where the yield from barley planted in late May was only 33% as great as when planted in mid-April.

# Many Consumers Believe that We Farmers are War Profiteers

**That idea is going to hurt us in the long run, unless we take decisive steps now, to establish the truth of our position**

Go into any grocery or butcher shop—even in small towns surrounded by farms—and you are likely to hear angry remarks about "greedy farmers getting rich out of the war emergency"

They talk about food rotting in caves while little children go hungry . . . about a callous government that buys farm votes with high price-supports and parity . . . and about enormous stocks of surplus food given away to foreign lands in a panicky effort to get rid of it.

## It's Misinformation, But . . .

Of course, these people are misinformed. But they're mad clean through and in no mood to search out and weigh the facts. We must do that for them. Nobody else will. Not even the butchers and grocers who agree with them. Not the newspapers and radio stations which gleefully report every farm-price rise, and are caustic and critical in their editorial comment.

The fact is that probably never before have farmers stood so low in public relations. You see women turning away empty-handed from meat counters, deliberately and loudly saying: "too high." You hear groups bragging about not eating meat, about buying oleo, condensed milk, canned fish. And most of it just because they are mad, not because they are unable to pay the prices asked.

## Secretary Brannan Tries to Help

Secretary Brannan of the Agriculture Department has made some valiant efforts to place the farmer's true situation before the public view. But in general he has met with thinly-veiled hostility and skepticism; 1st, because he is regarded as a wheel-horse for the Administration; 2nd, because he is regarded as a special pleader for farm votes; and 3d, because he is known as the author of a plan that is suspected of advancing farm prices at great cost to the taxpayer.

## We Must Do It Ourselves

Definite steps should be taken to check this misleading and dangerous propaganda. But they must be taken by farmers themselves . . . in their own communities . . . in conversations with friends and business people . . . in letters to newspapers and radio commentators and talks with editors. Every farmer and his wife can take a hand, simply by telling the conditions as they exist on their own farm. For example, how much it costs today to feed a cow, hen or hog, as against what it cost in 1945. Or how many pounds of milk it takes today to pay for a hired hand, a milking machine or a hay loader as against the cost before Korea.

We farmers know we are not war profiteers. But that's not enough. The consumer must be made to know it, too. If he isn't, we are going to suffer. We can't prosper with the hostility of 32,000,000 non-farm families—our customers—arrayed against us.

## Young Connecticut Vegetable Grower Wins Scholarship

ALBERT B. BISHOP, 19, of Guilford, Conn., recently elected vice president of the National Junior Vegetable Growers Association, is an outstanding example of what hard work and study

Al Bishop

can achieve. A student at the University of Connecticut, young Bishop was recently awarded a \$200 regional championship in the annual production-marketing contest of the NJVGA. This award, made from a \$6,000 fund provided each year for the contest by A & P Food Stores, was based on Albert's fine job of growing and selling vegetables. He won the scholarship in competition with thousands of farm youths throughout the northeastern region.

Winners in the production-marketing contest are decided on the basis of efficiency in growing and selling vegetables plus the knowledge of the science involved in proper growing and the use of modern marketing methods. Bishop devoted almost two acres of his father's 175-acre farm to his contest project. Growing only tomatoes, he grossed \$1,257, after less than 250 hours of part-time work. Subtracting all his expenses plus the cost of his own labor, which he estimated at \$187, Albert wound up with a net profit of \$580.

Bishop has been a member of the NJVGA for several years, is also an outstanding student and is very active in school, FFA and 4-H Club work. He was secretary of the Guilford-Madison FFA chapter for three consecutive years and is membership chairman for the University of Connecticut's 4-H Club.

As vice president of the national organization, Bishop will be responsible for planning and carrying through the NJVGA's three-part program.

Bishop also won first place in the judging-grading-identification contest finals held at the New Orleans convention December 10-14. More than five hundred farm boys and girls from forty states attended this convention.

## FIFTY PERCENT LABOR SAVING POSSIBLE

Tear out the partitions in your poultry house. That is the modern recommendation for commercial poultrymen faced with a scarcity of labor and high costs.

The old-type 20' x 20' pen is out of date because it is too costly in time and labor. A 50 percent saving in the time required for feeding, egg gathering and other chores may be obtained in larger pens.

"You can keep 500 or even 1000 birds in one big room instead of dividing them into pens of from 100 to 200," says Wade Rice, Extension Poultryman at the University of Maryland.

## BABCOCK'S HEALTHY CHICKS

MAKE GREAT LAYERS

At the 1950 Storrs Conn. Egg Laying Test, our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record for all breeds. All tests won in 1944-45.

**WE HATCH THE YEAR 'ROUND**

White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. . . own two hatcheries with 900,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

# It Is Safe to Brood On Old Litter—SOMETIMES

By L. E. WEAVER

**A**S most people know, the accepted method of brooding chicks is to start each lot on fresh litter in a pen that has been conscientiously cleaned after the previous lot of chicks was removed. The hope is that by getting rid of dirt you also rid the place of most of the disease-causing germs and worm eggs, if not all of them. In theory, the place is again safe for another lot of chicks. Of late, some questions have arisen about this procedure. Is it really the best plan, always? Could it be simplified and still be satisfactory?

Out in Ohio, at the Wooster Experimental Station, they followed this approved plan for ten lots of chicks, one after the other in the same pen, a total of 18,000 chicks. During that time they lost 19 chicks out of every 100 started, during 12 to 16 weeks.

Then they changed the plan radically. There was no more changing of litter. Each new lot of chicks for 13 successive broods was started on the same old used litter. And with each succeeding lot the losses were smaller and smaller. Of the first lot brooded on old litter, 15 died per 100 started, in the second lot 10 per 100 started. After that the average was 5 losses per 100 for 11 consecutive lots.

Astonishing results, but no more so than the additional discovery that within the old built-up litter certain vitamins, known to be essential for the health and growth of chicks, are being produced continually through the action of favorable bacteria. It is probable that these nutritive factors insured ample supplies in the rations of Dr. Kennard's chicks, and contributed to the good results. In later tests Dr. Kennard demonstrated that chicks started on old litter previously used by laying hens lived and grew as well as the first lots had done on old brooder-house litter.

## Not the Whole Story

In the light of such strong evidence that more and better young stock can be the result of brooding on old litter, why should anyone hesitate to advise everybody to adopt the new and simpler practice?

The answer is that one test, or even several repetitions of the same experiment, cannot tell the whole story. For example, all those Ohio tests presumably used chicks from one source. How do we know that chicks from other sources might not be less adapted to such treatment, and therefore might react quite differently to the treatment?

Of course the only way to get the answer to that one is to try out chicks from a number of places in one place and at one time. The Massachusetts station has done just that. They got R. I. Red chicks from a local hatchery, White Leghorn chicks from a neighboring state, also Barred Ply-

mouth, White Plymouth Rocks and New Hampshires from different places. All were brooded on what Professor Jeffrey of the University of Massachusetts called "dirty litter." It had been used by previous broods of chicks and was, therefore, truly re-used litter. In addition, the men who cared for the chicks walked freely from laying pens to the brooder room taking no precautions to prevent spread of dirt or infection, and they walked freely in and out of an adjoining killing room. In fact, the same men who did the killing and dressing of poultry took care of the chicks.

Chicks were also brooded on clean litter for comparison. In all, 20 strains were on clean litter and 16 on dirty litter. From 350 to 450 chicks were started per brooder.

Clean litter showed up best on chick livability. All but three of the 20 lots on clean litter showed less than 5 per cent loss of chicks, while on dirty litter all but 4 of the 16 lots lost more than 5 per cent. In these tests, therefore, mortality was definitely higher on dirty litter.

## Weight Gains

Now how about gains in weight? Again the chicks on clean litter made the best showing. At 6 weeks, 18 of 20 lots weighed a pound or more per chick, but on dirty litter only 9 of the 16 pens made the one pound average. Seven pens on clean litter reached a weight of 1.4 pounds, but not one lot on dirty.

In their first year on dirty litter, one lot of R. I. Reds had a mortality of 35 per cent during the brooding period. The second year it dropped to 13.6 per cent, but was still so high in the laying pens that the line had to be discarded. On the other hand, a strain of Leghorns which evidently possessed a lot of resistance to unfavorable brooding conditions didn't lose a chick in 14 weeks. Still other strains did equally well on clean and dirty litter. Some strains with high losses on dirty litter the first year dropped to less than 5 per cent in subsequent seasons.

From these experiments Professor Jeffrey concludes that it should be possible to breed strains that will do well under unfavorable environments, and that breeders should brood their chicks on dirty litter, but only breeders. Commercial egg farmers who are rearing replacement pullets might better play safe and brood on clean litter.

When litter is deep and not sufficiently stirred, and ventilation is not sufficient, ammonia fumes may become so concentrated that the eyes of the chicks become burned. This results in blind chicks. Dr. Levine at Cornell says that an increasing number of such chicks are being brought into the state disease laboratories, and he thinks there is a relationship between this increase and the increased use of old litter.

## My Own Suggestion

1. Brood your own chicks on old litter and save a lot of hard work, but first be sure that the chicks you are starting are able to take that sort of treatment.
2. Do not put chicks on old litter which was used by laying hens, unless you are a breeder and want to breed resistance into your strain.
3. Remember that the majority of chicks are still being brooded on clean new litter, and are doing very well as a rule.
4. If you do brood on old litter, cover it with an inch or two of clean new litter at the start.

# Gas Tank Rust can stop your PLOWING!

## ... with ANTI-RUST SINCLAIR GASOLINE

Small amounts of water, present in every gas tank from condensation, cause rust and corrosion, which can clog fuel lines, carburetor jets, cost you money in wasted gasoline and repairs.

But Sinclair gasoline now contains a miracle ingredient, RD-119. This Sinclair rust inhibitor forms an invisible, water-proof film on any metal it touches and stops the formation of rust and corrosion.

Stop rust, protect your power with the World's First Anti-Rust Gasoline—at no extra cost. Phone your Sinclair representative today!

World's First Anti-Rust Gasoline...

# SINCLAIR GASOLINE with RD-119®

Magnified carburetor jet, showing how speck of rust can clog passage. This causes stalling, sputtering.

When writing advertisers be sure to mention AMERICAN AGRICULTURIST.

## "... And Eat It, Too"

If individual incentive, ambition and responsibility are some day eliminated from American life, this will not, in all probability, be the result of frank, open conscious advocacy of Communism, Socialism or some other collectivist philosophy. It will be the consequence of a very wide-spread desire to have one's cake and eat it, too.—William Henry Chamberlin, in the Wall Street Journal.

## The Condé "400" MILKER

Helps to Eliminate

Major Causes of Mastitis

CONDÉ MILKERS, SHERRILL, N.Y.

By J. F. "Doc" ROBERTS

**L**IVESTOCK continues to fluctuate within a small price range but the changes are mostly upward.

The "freezes" have done nothing except upset the orderly trend of business thinking; create an atmosphere of caution in some men, boldness in others, with bewilderment and disgust within the industry.

Price ceilings are going on hogs — probably before you read this. That is politics in full bloom. Pork is our cheapest meat; it is below parity and way too cheap compared to everything else. But politically, it is the easiest to control because it is sold largely according to weight rather than quality. What a hoax is being put over on the American housewife!

\* \*

Well, I have sold some of my heifers that I bought last fall to feed for meat. They have done very well; they have gained over 200 pounds and are bringing around 27 cents a pound. Dairy heifers are being over-marketed. Even good dairy cow prospects and bred heifers are going for meat. The reason is simple: they are bringing as much or more for meat than prospectively for dairy purposes. Therefore, I have sorted out about 40 of my best heifers and have had them vaccinated and bred for October freshening. This may or may not pay dividends, but it looks to me as if good dairy prospects will work higher this summer. It has also given me the opportunity to sell off any animal that wasn't a good dairy prospect. Perhaps others can use this type of reasoning with young stock and improve their own herds and the general average. There never was a better time.

### Unfair Competition

The price "freezes" have allowed some slaughterers to sell the same animals or animal products at one price

(Continued on Page 20)

## Friendliness...

A friendly atmosphere makes Hotel Syracuse top choice of visitors.

**DOWN THE ALLEY**

(Continued from Page 19)

while a competitor could sell at another, and this price differential is large enough to break one man and make the other rich. Obviously nothing could be worse, for the meat industry varies greatly in the many ways of cutting and selling the finished product.

Labor, according to Mr. Brannan himself, is buying food now for less in relation to income than pre-war, yet labor is getting raises, and food prices are meeting all sorts of political propaganda.

"Doe, your trouble is, you are still fighting for American freedoms which most of us feel are already gone. That is the reason for the complacency in most of us."

This was said to me just recently by a good agricultural friend of mine in a tone of just criticism. Can it be true? If it is, then nothing much matters, for we are through as a nation, as a people, and as individuals, for we are just waiting around to be taken over and driven. I just cannot believe it, but complacency can and will defeat us. What we will not work for, fight for, and protect, is not worth having. That is one of God's laws.

—A.A.—

**BRIGHAM HERD RECORD**

Since Tom Milliman reported to you concerning his visit to the Jersey herd of Elbert Brigham of St. Albans, Vermont, Mr. Brigham sends this note which we are passing along to you.

"The 1950 herd average is now a matter of official record—102 cows, 10,973 lbs. milk, 5.3%, 577 lbs. fat, thus making the tenth year of over 500 lbs. of butterfat, this being Mr. Lacoste's objective, although he is still going strong."

—A.A.—

**DON'T MISS OUR  
ALASKA TOUR!**

SNOWCAPPED Mount Leroy, near Lake Louise in the Canadian Rockies, is just one of the beautiful sights that will be seen by the folks who go on our AMERICAN AGRICULTURIST Alaska Tour this summer. Yellowstone Park, Seattle, Mt. Rainier, Victoria, Alaska, Lake Louise and Banff — these and many

—Photo by Canadian Pacific Railway

other famous places will be visited.

The dates are August 1 to 26, and the "all expense" ticket for this trip of a lifetime includes everything — even tips. We can take only 93, and reservations are coming in every day. Therefore, if you want to go, you will have to act fast. Write to E. R. Eastman, AMERICAN AGRICULTURIST, Box 367-T, Ithaca, N. Y., for a copy of the itinerary, which gives full details and the exact cost from your location.

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. He is followed into the army by his brother, Charlie, his father, George Wilson, and by Ann's father, Fred Clinton. The winter continues to be difficult, but cheering news to Nancy Wilson and Ann is the fact that George and the boys are now in the band. The bad news of the Peninsula Campaign brought gloom to the North and letters from the front were scarce. Ann tries to persuade her mother to let Henry Bain take their farm for the mortgage and let her go back to teaching, but Mrs. Clinton makes so much fuss about it, that Ann gives up the idea. The next news that comes is from George Wilson saying that Mark has been court-martialed.

## CHAPTER XV (Continued)

NANCY and Ann seated themselves in an anteroom to the President's office and watched the steady stream of callers pass in and out of the door behind which they knew was the man who held Mark's destiny and theirs in his hands. In the line of callers were well-dressed business men, looking interested and hopeful as they entered, then a few minutes later hurrying out again, their faces indicative of whether or not their mission had been successful. In the passing throng, too, were dignified looking men with their tall stovepipe hats. Ann and Nancy thought they must be members of the Congress or at least holders of important administrative offices. Then there were the military men, high officers in their blue uniforms reporting to their Commander-in-Chief. After watching the hurrying crowd for a while, Ann said, despairingly:

"How can so busy a man as Mr. Lincoln, with such great responsibilities, have any time for us?"

After a long time there seemed to be a little lull in the stream of callers. The door of the inner office opened from the inside, and the tall, angular frame of Abraham Lincoln was framed in it. Ann and Nancy jumped to their feet, and Nancy said:

"Mr. President!"

He looked at them, smiled and said: "What can I do for you, ladies?"

"I'm Mrs. Nancy Wilson and this is Ann Wilson, my daughter-in-law. We've come all the way from New York State," said Nancy, "to talk with you about a matter of life and death."

The little smile left the homely, tired face. Slowly, with shoulders suddenly hunched, he turned around and started back into his office, saying, briefly:

"Come on in!"

The President's first remark after they were all seated surprised them:

"Did you have any breakfast?"

"Well, some, Mr. Lincoln. We put up a lunch and ate it on the train, but this morning we didn't want to take the time to eat, and we didn't know where to get anything. Also, we wanted to see you as soon as we could."

"Reminds me of when I was a boy and used to carry my dinner," said the President. Then leaning forward and smiling at Nancy, he drawled:

"Ever make a meal out of just crackers and cheese?"

"Yes, I have, Mr. Lincoln."

"I knew it! All country folks have."

Then he settled back in his chair again, with a far-away look on his face, and added:

"And so have I, many times. Maybe crackers and cheese weren't much for vittles, but I'd just like to have anything I eat now taste half so good!"

"A boy's appetite makes the difference, doesn't it, Mr. Lincoln?"

"Yes," he agreed, "— and a man's troubles. But now tell me what I can do for you. Why are you here?"

Both Nancy and Ann had expected that if they could see the President, he would be hurried and abrupt with them, and that being nervous and pressed for time they would have difficulty in telling their story. But Lincoln was just like the folks they had always known. They soon forgot his high office and found themselves opening up their hearts as they would to an old friend.

"Ann's husband — my son — Mark Wilson, enlisted the morning after they were married. Charlie Wilson, another of my boys, ran away and enlisted at 17. Then my husband, George, also went."

"Yes, I know, I know," he said, a little impatiently, they thought. It's the same sad story of thousands of families. But how is it different from the others? Why have you come all this long way to see me?"

Then Nancy told the whole story. When she had finished she leaned forward toward the President and her voice suddenly broke:

"M-M-Mark's a good boy, Mr. President. He's innocent of any wrongdoing."

Lincoln turned in his chair and sat gazing out over the White House lawn, simmering in the heat of a late September day in Washington. The women

waited, reading into his silence a reluctance to tell them that he couldn't interfere. But after a while he turned back to them, and almost subconsciously Nancy noticed how the lines of care and trouble had begun to cut themselves deep into the craggy face. Still without speaking he looked at them, then got up and shuffled across the room in his old carpet slippers to stand by the window, his clothes hanging loosely on his ungainly frame, his hands clasped behind him. Suddenly he swung around, came back to his desk and sat down, while Nancy and Ann waited, feeling as prisoners at the bar must feel when the jury is about to render a life or death verdict.

The President's first words were not encouraging:

"You know," he said, "that the fate of a whole army and the lives of hundreds of men can depend upon the loyalty and the judgment of one man on the picket line. I must tell you, also, that things are entirely different in war than they are in peace. Most of the very principles we are fighting for have to be given up temporarily. That means among other things that discipline in any army must be rigidly maintained."

He smiled sadly:

"The generals are always scolding me because they say I'm bad for army discipline when I let go some boy whom the military courts have condemned."

Then, almost as if he were alone and talking to himself, he added:

"Maybe they're right. But there's something so absolute about death. These boys—almost all of them — are so young, so young!"

He straightened up in his chair, threw back his shoulders as if he were literally defying the army and all of its works, and looked directly at his visitors. For all the rest of her life Ann was to remember the infinite sadness in those great eyes. It seemed to her that that stooped figure was carrying the burden of all mankind on those broad shoulders. Suddenly the President leaned over his desk, pulled a sheet of paper toward him and began to write.

Just then came an interruption. A clerk opened the door and announced: "The Secretary of War is here, Mr.

President."

Without waiting for an invitation, Secretary Stanton entered and strode purposefully toward the President's desk. He was dressed in black, with an open collar, a black flowing tie, and carried his hat in his hand. Nancy and Ann stood up respectfully as he passed them.

"Goodday, Mr. President," he said, brusquely, and then glanced meaningfully at the women. "I must see you immediately, and alone."

Lincoln grinned.

"Just a minute, Stanton. I have guests. By the way, I'm glad you are here. You're just the man I want to see."

Stanton looked impatient.

"But I've got to talk with you immediately—alone," he insisted.

"In good time, in good time!" said Lincoln. "Meet my callers. This is Mrs. Nancy Wilson, and this is Mrs. Ann Wilson, her daughter-in-law. They are the mother and wife respectively of one Mark Wilson, a soldier whom your officers, Mr. Stanton, have court-martialed and sentenced to be shot."

Stanton's face was red:

"You aren't going to interfere again, Mr. President," he burst forth. "You're raising havoc with our discipline."

"Maybe so," Lincoln agreed, "but we have enough bloodshed, God knows, without any that is unnecessary. I don't believe this boy was guilty of anything but a mistake that any of us might have made. Here's my signed pardon. Will you kindly act accordingly."

He handed the paper on which he had just written to the Secretary of War, who stuffed it angrily and carelessly into a pocket. Lincoln smiled again, but there was something in that smile that the women and the Secretary both recognized as a hint that the order had better not be disobeyed.

Impulsively Ann stepped forward to shake the President's hand. He came around from behind his desk and put one arm across her shoulders, offering his other hand to Nancy.

"I never forget," he said, "that women fight these wars as well as the men, and that without you and others like you to carry on at home, we never could win through. May God go with you and with all the other home folks!"

## CHAPTER XVI

AS they came out of President Lincoln's office after their talk with him, Nancy laid a detaining hand on Ann's arm and led her to a seat in the anteroom. With shining eyes and face flushed with happiness, Ann impulsively threw her arm around Nancy and hugged her hard, oblivious of the curious glances of other occupants of the room.

"A great man!" she cried. "But how sad and lonely he looked." Then she added:

"But what are we waiting for? Everything is all right now. We can go home."

Nancy started to speak, hesitated, and then said softly: "We mustn't get our hopes up—but—we're so near our men now, wouldn't it be wonderful if we could see them?"

Excited, Ann jumped to her feet:

"Oh yes, yes," she breathed. "But how? We don't know how."

Nancy pulled her back into the chair beside her.

"I have a plan," she whispered. "Maybe it won't work, but just be patient a little longer, dear."

As they sat there, the line of callers in the anteroom grew, all of them awaiting the end of the Secretary of War's interview with the President. Suddenly the door was flung open and Secretary Stanton marched out. Nancy rose, drawing Ann with her, and stood directly in front of him so that he had no alternative but to stop. He glared

# The Whole County is Baking BREAD

By  
MABEL HEBEL

HERE are other ways to make bread, but this is a guaranteed way to make a perfect loaf and to teach others to do it. That was the way Miss Lillian Shaben, one of Cornell University's six Extension specialists in foods and nutrition, began a series of three stream-

lined baking lessons for Onondaga County, New York, Home Bureau leaders at the County's well-equipped work center in Syracuse.

Over 300 women in the county, members of various Home Bureau units, had registered for the bread and rolls project—and with only one specialist available to teach them, and facilities at the workshop for around 12 persons, this might seem to present an insurmountable problem. Not, however, when you're doing it the home bureau way, which means that one specialist trains a dozen unit leaders, who in turn teach their neighbors.

To make the lesson go even further, the County Leader attends the original demonstration, and then she in turn teaches one or more groups of a dozen unit leaders—who in turn teach their neighbors, and so on.

The impact of this "chain reaction" type of teaching may be judged by what happened in one New York State county last year after the breadmaking lessons were given. A driver for a local bakery reported that his volume had been cut 300 loaves a week on just one rural route, or an average of 60 loaves a day!

In order to see this kind of teaching in action, I attended the Onondaga County bread lessons. "Bread," Miss Shaben had told me, "is my favorite project and the one the women remember the longest."

At 9 a.m. on the day of the first lesson, we hurried over to the workshop with the County's popular and very

Shaping the loaf was the hardest part of the lesson. Here Miss Lillian Shaben (at left) shows Mrs. Edgar LaBelle, Mattydale, N. Y., how to "ease out" her dough into a roll in the process of shaping it. The four other women, from left to right, are: Mrs. Charles Bush, Mattydale; Mrs. Mark Loveless, Brewerton; Mrs. Grant Grimshaw, Lafayette, and Mrs. Joseph Gorny, Tully, N. Y. Other women who were present, but are not in either picture, are: Mrs. Thomas Heselden, Syracuse, R. 2; Mrs. Clyde Ladd, Clay, N. Y.; Mrs. Harold Nauman, North Syracuse, and Mrs. Christen Skaar, E. Syracuse, R.D. 3.

—Photos by Robert G. Elliott

capable Home Bureau Agent, Mrs. Eileen Androus, and her assistant, Mrs. Ruth Sager. Preparations went very fast, with all hands busy, until 10 o'clock when eleven unit leaders arrived, bringing aprons, bread pans, and their lunches. The regular County Leader, Mrs. Herbert Smith of Syracuse, was ill, but in her place came Madison County's leader, Mrs. Stephen Sweetland of Casenovia, N. Y. Her job was simply to observe Miss Shaben's

method, so she could pass it on to the two other groups of leaders that she in turn would teach to teach their neighbors.

By 10 o'clock everything was ready—the yeast, the sifted bread flour and other dry ingredients on a table at the right; at the left, on the stove, the scalded milk cooled to lukewarm, and the melted fat. Cups, spoons, bowls, etc., had been washed, dried and set forth on trays. Two long tables down the middle of the room had been covered with white paper, and a pastry cloth and bread recipe put at each place. At a small table at the head of the two long ones stood Miss Shaben, very pretty and professional in her crisp white uniform.

"I know that some of you women have made plenty of bread," she said smilingly, as she began her demonstration, "but today pretend you have never mixed up a batch of dough before. I'm going to give you a dependable method that you can teach to others." Skillfully she measured and mixed, talking as she worked and explaining every step in her method and the reason for it.

It was wonderful to watch her deft hands at work, and then the women follow suit. First, the measuring, mixing, kneading. Then the rising, the "punch down" and the shaping of the loaves. Finally, the last rising and the baking. To hurry the rising along, the amount of yeast in the recipe was doubled.

Except for time out for lunch, there was no interruption to the continuous round of demonstration and practice, and to the valuable hints that came in a steady stream from the teacher.

"Don't pack the flour in the cup. A cup of packed flour may equal one and a third cups of sifted flour, lightly

spooned into the cup. We use less flour in making bread today."

\* \* \*

"Knead the dough in the bowl first. It's easier and you don't need so much flour."

\* \* \*

"Don't grease the loaf before baking, or you'll have a speckled crust."

\* \* \*

"Professional breadmakers don't have dough or flour all over the place."

She showed the women how to prepare their pastry cloths by rubbing flour into them thoroughly. She said, "The flour keeps the pastry cloth clean. Just shake it when through, roll or fold it up, and put it in a tightly covered canister, so it won't get 'buggy.' Wash it only if you get grease or batter on it."

After kneading her dough in the bowl with a "grab, twist, pull up" series of motions, she turned the rough ball of dough onto her pastry cloth, and kneaded it into a smooth, compact ball. Before putting it back in the mixing bowl to rise, she showed the class how to clean the bowl with the floured tips of the fingers.

"You clean a little patch on the bottom, then work up the sides, a bit at a time. Get the bowl and mixing spoon as clean as wax. It's wasteful to leave dough on them. When the bowl is clean, you grease it and put the ball of dough back in it to rise."

When it came time to bake the bread, two of the women were appointed "oven guardians." Baking time was divided into quarters, and the loaves inspected from quarter to quarter to see that they were browning evenly. When they were done, and turned out on racks on the table, the golden loaves were a thrilling sight. A piece of white paper bearing the name of the maker had

(Continued on Page 24)

Breadmaking was an entirely new experience for Mrs. John Yoest (center) and Mrs. Richard Blesh (right), both of North Syracuse. At left, Mrs. Lois Hessler of Clay, N. Y., one of the experienced breadmakers who attended the Onondaga County Home Bureau training school, begins to shape her second loaf.

## The Whole County is Baking BREAD

(Continued from Page 23)

been tucked into the end of each bread pan, so they could be easily identified. The first loaf out of the oven was perfect in shape and color, and belonged to Mrs. John Yoest of North Syracuse. She had never made bread before, and when she saw it, she said, delightedly: "I'm going to take it home and frame it!"

Between the first and second lessons (they were spaced two weeks apart), the women did their "homework" — baked bread three times, and then each brought a loaf to the second lesson so that Miss Shaben could tell them their good and bad points. At the second lesson, five other kinds of bread were baked: Whole Wheat, Golden Corn Loaf, Oatmeal Bread, Oatmeal Whole Wheat, and Holiday Rye Bread. This meant a lot more "homework" between the second and third lessons.

At the third lesson, I asked several of the women how they liked Miss Shaben's method. They said: "It's quicker, easier, and always turns out right. She has taught us many things you wouldn't think of yourself." Several other comments were:

"Method of shaping is easier after you get used to it."

"Use of milk makes the bread more nutritious."

"I like adding the shortening after half the flour, instead of before the flour, as other recipes call for."

"Kneading first in the bowl instead of entirely on the board is easier and avoids using too much flour."

"Dividing the baking into quarters and knowing just what to expect in each quarter is a big help."

At the rolls lesson on the last of the three days, two kinds of dough were prepared by the women — "Dinner Rolls" and "Butter Rolls." "You're professional breadmakers now," said Miss Shaben when they arrived, "so go right ahead and mix up your batters according to the recipes."

It was a three-ring circus that day, with Miss Shaben demonstrating the making of all kinds of rolls, and the women copying what she did—first, a beautiful Swedish Tea Ring, and then coils, clover leaves, rosettes, knots, fantans, jam rolls, parkerhouse rolls, cinnamon buns and crescents. She was always showing them the quickest, easiest way. When making crescent rolls, instead of rolling up the whole triangle, she rolled the big end over once, then raised it quickly in the air and flipped it into a finished roll.

"Whee-ee, wouldn't my boys enjoy doing that!" said one woman.

A dozen tea rings and 50 dozen rolls were made that day. The cost of materials averaged \$1.10 each, but each woman took home about \$2.50 worth of baked goods — and a college course in home baking!

I was impressed with the attendance record at the three lessons. All of the women reported for the second one, in spite of a bad snowstorm. Two who were unable to come to the third lesson (one was on jury duty, and the other's children were ill) sent replacements who would pass along the lesson to them. Mrs. Grant Grimshaw of LaFayette, came in spite of being ill from typhoid shots taken in connection with a nurses' aid training course. Although a temperature of 102 kept her from doing the practice work, she observed the demonstration and took notes.

The Mayfield Home Bureau had three young leaders at the final lesson. Two came to the first lesson, but so many of the unit's 80 members wanted the bread and rolls lessons that the first

two— Mrs. Richard Blesh and Mrs. John Yoest, both of North Syracuse— taught a third member, Mrs. Harold Nauman, also of North Syracuse, and brought her along to the rolls lesson. None of them had ever made yeast bread or rolls before and were thrilled with the results they got.

The twelve leaders will now have the job of teaching their Home Bureau neighbors what they have learned. The number of women who will eventually learn to make bread and rolls as the result of the three lessons given by Miss Shaben in Onondaga County becomes astronomical when you start figuring it by years. Next year— and the year after that—there'll be more members of these same Home Bureau units who will want to learn the art, and who will be taught by either the first, second, or third run of teachers resulting from the original demonstrations.

"I once figured the final number at 1,500 in just one county," said Miss Shaben when I asked her about it.

## Cotton Charmers

**No. 2412.** Double duty idea! By itself the dress is a cap sleeve basic. Teamed with the fitted jacket, it's a street costume. Nice in many fabrics from sheers and prints to linen. Sizes 12-20, 36-42. Size 18, 5 1/2 yds. 25-in.

**No. 2122.** Three reasons why you'll especially like this easy-to-make washable! Its youthful styling. Its scoop neck. Its slimming panel lines. Sizes 12-20, 36-42. Size 18, 4 yds. 35-in., with 4 1/2 yds. ric rac.

**No. 2953.** Town and country two piece with fitted jacket, pleat-eased skirt—your best choice for cool seersucker or cotton print. Long sleeves,

too. Sizes 12-20, 36-48. Size 18, 4 1/2 yds. 35-in. Trim, 3 3/4 yds.

**No. 2432.** This dirndl can be as dressy as the material you make it in! For a cotton charmer, try gingham or chambray with bias bertha collar and skirt band. Sizes 4-10. Size 8, 2 3/4 yds. 35-in. Edging, 3 3/4 yds.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our new Spring-Summer Fashion Book which has pattern designs for all ages, sizes and occasions. Send to **AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.**

### SPRING VISTA

By Ae'lis Churchill Chaphe

A valley in shadow,  
A sun-drenched hill  
Where apple blossoms  
Their fragrance spill.

A farmer plowing  
The warm brown earth  
Where seeds will soon  
Have their rebirth.

And over all  
A bowl of sky  
Where little cloud ships  
At anchor lie.

Peace and contentment,  
Who could ask more  
Than this vista seen  
Through Spring's open door?

That's a big class for one teacher! And the Home Bureau type of teaching has other far-reaching results, for besides being a practical way to spread knowledge and skill, it creates community spirit and develops local leaders who might otherwise never know they "had it in them" to teach others.

[NOTE: Miss Shaben's bread recipe and method will be given in a coming issue of AMERICAN AGRICULTURIST.]

## NO DRUMS

(Continued from Page 22)

impatiently; then, recognizing her, said, shortly:

"Excuse me, Madam. I am in a hurry."

Then, looking more closely at Nancy's strained, terrified, but resolute face, he said, kindly:

"Don't worry about your son." With a grim smile, he added: "I have my orders."

Nancy often wondered afterwards how she had the temerity to stand up before this great man and ask of him what she did.

"Mr. Secretary," she said, "four of our menfolks are in this war. We've come a long way. Now that we are near them, couldn't we see them, if only for a few minutes?"

"No," barked Stanton. "It's impossible!"

As the women turned away with drooping shoulders, he stood staring at them briefly, and suddenly said:

"Wait!" Then dashing their rising hopes again, "No, the army is on the move. McClellan is moving south after Antietam. You couldn't find the army. Besides, you have no way of getting there even if you could."

Then, as the women turned away disconsolately again, he barked:

"Wait till I finish, can't you?" A little smile lighted up his features as he added, "Now that the President has let your boy loose, I might as well go him one better. Give me the names of your men and their regiments."

As Nancy gave him the information, the Secretary wrote it down.

"Where are you staying?" was his next question.

When he heard that they had only come into the city that morning and had no lodgings, he gave them the name of an hotel.

"Go there," he ordered, "Wait and see what I can do. Perhaps I can send them to you. It may be two or three days—maybe not at all."

Then, as if ashamed of his softness, he turned and walked out of the room.

Never in their lives had time dragged as it did for Nancy and Ann in the next few days. They dared not risk leaving their hotel room together, even for food, lest there might be no one there if their men came. Occasionally from their bedroom window they watched the hurrying traffic on Pennsylvania Avenue, but with little interest because of their alternating hopes and fears. When either one of them went out to eat, she would hurry back in case someone had come in her absence.

After three days had gone by, when their cash was nearly gone and they had about given up hope, there came a knock on the bedroom door. Both rushed to open it, and there, framed in the doorway, were George and Mark and Charles, all in their blue uniforms.

For the first few minutes all were choked with emotion, too happy to speak. But finally they settled themselves, Ann on the edge of the bed, with Mark's arm around her. After the first exciting moments were over, George asked numberless questions about the farm and the children, and Nancy answered them as fast as she could. It was wonderful, she thought, to be able to talk to him.

"Tom took your parting words about his being the man of the family very seriously," she said. "He works every minute that he isn't in school, and never complains about anything. And what we would have done without Enoch Payne, I'm sure I don't know," she continued, "for he and Tom have made a great pair. Enoch likes Tom and tries to show him the best way of getting at a job."

Ann laughed:

"Tom's not the only one Enoch likes," she said. "I think he and Mary Curtis

are sweet on each other."

"I'm sure I hope so," said Nancy. "I don't know a nicer couple, and they have a right to a little happiness."

"Tell me more about my little daughters," said George.

Nancy shot a merry look at Ann and said:

"Ask Ann to tell you about the time she took them blackberrying, and Hattie got lost."

"Well, I found her again," protested Ann.

"Anyway," said Nancy, "the girls are coming along just fine. Better hurry up and get home or you won't know them when you see them. They're growing so fast."

Although the events leading up to their reunion in Washington were uppermost in everyone's mind, nothing was said about them until then. It was George who finally said:

"I guess we know what happened about Mark. You must have seen Mr. Lincoln."

"Yes, we did," answered Nancy, eagerly, "and Mr. Stanton, too. It was he who had arranged it so you could come to see us. They say he's a hard man, but I for one will never believe all the stories about his being so stern and unbending."

"Maybe it makes a difference who talks to him," said Charlie, grinning.

Everyone laughed, and then they all seemed to talk at the same time, as excited questions and answers followed in quick succession.

Over and over, Ann and Nancy had to tell of their journey, their wonderful meeting with the President, how he looked and what he said; their hopes and fears, and finally of Nancy's great courage in intercepting the Secretary of War right in the White House. Then the men had to recount the details of their surprise and joy over Mark's sudden release and the mysterious order for the three of them to go at once to Washington to meet their womenfolk.

It was all so wonderful, they said; just like a story. But at last George declared:

"We haven't got much time. We've got to go back tomorrow, so, Nancy, you and I had better do some planning."

While they talked, Ann sat silent, content and happy just to hold tightly to Mark, her heart aching as she felt the thinness of his body through his clothes and as she looked at his worn, care-lined face.

The rest of the afternoon and evening passed all too quickly. Nancy, with the lilt back in her voice, talked again and again of the little girls and of Tom at home, but made light of the problems and responsibility of the farm and of making a living. Likewise, George and Charlie and Mark, in telling of their experiences and adventures, passed quickly over the hardships of Army life.

Ann wanted to know about her father, and George said he was fine. Looking significantly at Ann so that she understood the inner meaning of his remark, he added:

"Your father is a fine soldier, Ann, doing well, and exceptionally well liked."

That filled Ann's cup of joy almost to overflowing. But later when she and Mark were in a room by themselves she grew silent and shy. Made sensitive by his recent disgrace, Mark misunderstood her reticence and he, too, fell silent. In bed they laid stiffly side by side, each waiting for the other to make the first advance. Suddenly Ann forgot her own shyness in a realization of what Mark must be feeling. Crying, "Mark, Mark, I love you so," she threw her arms around him. Then all the loneliness, the heartache, the frustrations were forgotten. The past was past; the future could take care of itself; they had the present and each other.

## AT HAYFIELDS

By TOM MILLIMAN

### ORCHARD GRASS—BAD AND GOOD

*A. The rank growing plant called orchard grass can be relied upon to crowd out the legumes in a pasture, the ladino going in a year or two and the alfalfa a year later, while the grass itself becomes tall, woody, and unpalatable, unfit for maintenance of milk flow in summer or fall, and of a certainty the least desirable of any species of grass now used.*

*B. Orchard grass is succulent and appetizing throughout the season, behaves well in the company of ladino and alfalfa, starts earliest in spring, yields best in midsummer heat, and winds up the grazing year with an unequalled record, for total production of grass and milk.*

A and B are both true. Over a 15-year period we've found orchard grass to be an agronomic monster or a dairy farm blessing, all according to the way it was handled. Our experience was on Ontario loam soil well supplied with organic matter and minerals. Such conditions provided the opportunity for orchard grass to be either very bad or very good. In a soil less well built up it would probably be milder in its performance in either direction.

Our difficulty was that early in the season we always had too many acres of orchard grass for the numbers of cattle made available to it. Even when we turned dry stock in with the milkers in the effort to subdue orchard grass in spring, it was generally done too late. Clipping was practiced and it, too, wasn't soon enough. A large acreage of orchard grass is virtually unmanageable, except at the expense of neglecting other pastures by withdrawing cattle from them, or by an excessive and wasteful amount of clipping. Extra clipping uses expensive gasoline, machinery, and manpower. By the trial and error method we have at long last solved the problem for our conditions.

*In 1951, only one acre of orchard grass will be provided for each six cows. Seven acres were seeded in 1950 with ladino and alfalfa in half a field. To fill out the other half we used the same legumes with brome grass. Now the orchard grass is reduced to manageable proportions, and we expect from it more milk and a greater number of pasture days than from the brome. By means of electric fence the two halves will be separated when the cows start grazing the orchard grass about April 30. The brome half will be 10 days later. The need for frequent clipping will be reduced.*

A report will be made for each half in terms of milk volume and cow days on an acre basis.

### BIRDSFOOT TREFOIL

IT'S ALL very well to talk about limited acreage of orchard grass or brome with ladino and alfalfa, electric fence, rotational grazing, clipping several times, and tight pasture management generally. Such a setup is as sound as wheat—even sounder than wheat—as far as it goes. Trouble is,

it covers only part of the story for either the farm or the cattle.

What about roughland pastures, only patches or islands of which can be renovated and new sods established? These do not easily lend themselves to rotational grazing or close management. On many farms in the Northeast will be found more acres of roughland pasture than of any other kind. Such pastures can't usually be managed carefully enough to keep such legumes as ladino and alfalfa growing in the renovated islands, and the whole properly clipped, with the right numbers (which means varying numbers) of cattle used throughout the season.

At Hayfields we've found that birds-

"Goldy", on his 5th birthday. In the records of the South Devon Herd Book Society, Newton Abbot, Devon, England, he is Estcourt No. 7, AL 46246, born Sept. 22, 1945. In the books of The American Dairy Cattle Club, Ithaca, N. Y., he is Gold Sovereign, No. 1156. But at Hayfields, he is "Goldy", named so by the men. The South Devons are very large cattle, yellowish red, producing yellow milk averaging 4.2% fat. Quiet, steady and of great forage consuming capacity, "Goldy" transmits these qualities to his offspring, and pleasing production too, as judged by the first two half-blood daughters to freshen. See "Goldy's" story under Wintering a Bull.

foot trefoil is our best solution for dry stock pasture. Where ladino or alfalfa would be and has been run out by grasses, even when grasses weren't planted, birdsfoot stays. It can survive in competition with overgrown timothy or bluegrass or brome and come back smiling with its little yellow flowers. In dry spells, when the tendency is to overgraze, birdsfoot can and does take and survive the kind of beating which chases out ladino and alfalfa in a hurry.

Birdsfoot isn't regarded at Hayfields as something to be deliberately abused and neglected. It responds to good treatment, and is richly rewarding when manured and fertilized with 0-19-19. Some of our friends who use it for hay, report yields of 3 tons in one late first cutting, followed by aftermath grazing a month later.

We intend this spring to put birdsfoot, after preparing the land, on some more irregular hill pasture spots which can't be reached by the manure spreader. We have no worry. Without fertilizer it will take care of itself, and with such a fertilizer as 0-19-19, it can be depended upon to be a high yielder as

well as a long term tenant. That "long term tenant" feature is the best of all.

### WINTERING A BULL

EXPERIENCE is the greatest teacher, even in the care of bulls. A year ago and more, Goldy was too fat. So were other bulls, but Goldy was the fattest. As a result, we milked this last fall and winter considerably fewer cows than intended. The percentage of dry cows and late freshening heifers was far too high.

In an effort to save the money invested in imported Goldy, we turned him out to graze in the hill pasture near the barn. Grass did the trick, along with sunshine and gentle roaming with a few heifers. Came fall of 1950 and we left Goldy out after all young stock had been brought in, pending completion of an extension to the cowbarn. Without it, we had no place to put him. Came winter, with the barn unfinished and Goldy still at pasture, without shelter of any kind except some bare trees in the swamp. For food he had the sweepings from the cows plus a little grain, and the only company he found by then was two fat horses.

Goldy had, by February 1st, slimmed down considerably. Finally the barn

### JIM GOES, STUB MOVES UP

FOR THE past 7 years, James J. Fisher has been manager at Hayfields. He leaves on April 1st to take over his father's farm and herd next door. Jim has been faithful, honest, intelligent, and industrious. In leaving, he takes with him on free lease, his own choice of Hayfields' young bulls. That he should want to continue our line of breed-blended cattle is a real testimonial. Jim and Mrs. Fisher are the parents of 7 fine children, three of them born during their Hayfields' stay.

Marion (Stub) Nobles has been with us 4 or 5 years, and now becomes manager. He is a good cowman and a fast, hard worker with quick understanding. He likes cattle, and with some coaching, should do all right on the farming too. "Stub" is younger than Jim, has 3 fine children of his own and a promising big stepson now 16, who wants to quit school and work on the farm.

George Gratton, Jr., whose parents live in the neighborhood, has been with us for 5 years or more, and now moves up a notch. A fine big fellow and good skilled worker, who is getting better right along. Still under 25, George got married last spring and occupies the third house on the farm. Although his wife was a village girl, she seems to find no difficulty in making the adjustment to farm life, and is a good cook.

It is mighty nice to have as a helpful neighbor the man who leaves to go on his own, and to be able to promote two other young men.

### MORE ON ANGUS BULLS

IN THE March 3rd issue, this page carried an article urging artificial service of Angus bulls to certain dairy cows. It quoted Manager W. F. Schaefer of the Northeastern Pennsylvania Artificial Breeding Cooperative on the highly successful experience in that area. Quite a number of letters have come this way since the article appeared; all being favorable. Among the letters is that of W. Allen Cowan, Assistant Professor of Animal Husbandry, University of Massachusetts, Amherst, reporting on the experience in New England. From Prof. Cowan's letter and other material he sent, the following points stand out:

The service is available throughout Massachusetts and has already extended into Connecticut and Vermont, with occasional shipments of Angus service into Maine and Rhode Island. Arrangements are now under consideration to supply New Hampshire. All this is from the three Angus bulls at the Massachusetts stud, from which 1,223 first services of Angus were made mostly to dairy cows in the first nine months.

Dairymen respond to it more each month as the service becomes better known. In December alone, 273 first services were credited to Angus bulls. The breeding efficiency has been very good, averaging about 3% higher than on other bulls on a 60-90 day non-return basis.

In addition to the points made here a month ago, Professor Cowan adds some others. These include:

1. Uniform polled, black calves for which a premium market has already been started.
2. Most desirable premium priced veal, if veal is raised.
3. Vigorous, hardy, crossbred calves.
4. Feeder calves could be sold—there is an excellent demand.
5. Overall improvement of dairy cattle. Poorer cows will tend to be mated to beef bulls and so fewer calves raised for milk from these poorer cows.

was completed, and on a zero day we brought him in. It was February 8th. Every day since then, except those the men mistakenly believe are too bad, Goldy is turned out for several hours into the same old pasture. Judging by his rapid regaining of flesh and percentage of cow returns, he has been too much babied, even for the short period of five weeks, and beginning March 15th, he will again be left out day and night.

With the other bulls such a thing could not be done, since nothing less than strong walls will hold them. But with Goldy, slow moving and placid as he is, pasture is the only place, considering his great respect for fences, horses, and people. Everyone who sees him likes him, most of all the men who work around him.

He is a bovine gentleman of great dignity, made somewhat awesome by his enormous size. The South Devons are the gentlest cattle known to man. We like the cross to Guernsey, Holstein, or mixed blood females. Credit the late Carl E. Ladd, Dean of Agriculture at Cornell, with introducing the first South Devon bull to U. S. A.

**Service Bureau**

By H. L. COSLINE

**COSTLY CANCELLATION**

Last December I ordered some apple trees and other small fruit shrubs from a nursery. Not taking the time to read all the fine print on the order blank, I signed the order. This winter, due to a change in plans, I wanted to cancel a portion of the order. The company informed me that it would be impossible unless I paid 40% of the price of the goods to be cancelled. I then woke up and read my sales slip. I found I not only must accept the goods, but also if I fail to pay all charges and to accept them on arrival, I will be held liable for all attorneys' fees and collection fees needed to collect or bring judgment. I'm afraid I'm stuck with the whole lot whether I like it or not.

It is common for an order taken by a door-to-door salesman to contain a clause stating that it cannot be cancelled. One reason for this is that the down payment such a salesman usually collects is his commission; and naturally a buyer would try to collect this down payment from the company if he could cancel the order.

The important thing is to understand this before you sign, and also to be sure that the agent represents a good company and that you will have the money to pay for the order when it arrives in case you only make a down payment to the agent.

**FRAUD?**

Last September I sent a check to the International Drug Co. in Quincy, Mass., for some pills which I have been getting from them for over ten years. I heard nothing from them, although my check was returned to me after being cashed. I wrote several letters which evidently reached them. Finally, I sent a registered letter, but that was returned to me. Then I checked with the Better Business Bureau and was told to report this to the Postal Inspector. The Inspector told me this company had been investigated but that no evidence was disclosed to warrant action under the Postal Fraud Laws. I can't understand why this company should be allowed to continue to do business in this manner.

This company has ignored letters written by the Better Business Bureau and won't answer our letters. The Service Bureau is still working on this, but we feel our readers should know our results to date.

— A.A. —

**KEEP TITLE IN YOUR NAME**

I sold a car over two years ago to an acquaintance of mine. He paid \$40 down and with difficulty I got all the rest except \$35. Now he has sold the car. What can I do?

Car dealers protect themselves in this respect by giving a conditional sales contract, which leaves the title with them until the car is paid for. Then if the buyer sells the machine before it is paid for, it is a criminal matter. We feel that individuals could well use the same procedure with private sales.

— A.A. —

**SEND COMPLETE DETAILS**

When you send in a claim, be sure to give all the facts about it. In several cases recently, we have worked for weeks on a claim, only to find that it had already been in the hands of a lawyer or had been in court before it was sent to us. It is not only embarrassing, but it takes important time which could be used on other claims where there is chance for success.

The Service Bureau cannot handle matters that have been in the hands of a lawyer or that have been in court. Report claims promptly and give us a complete background of each case.

# AMERICAN AGRICULTURIST

FOUNDED 1842

THE FARM PAPER OF THE NORTHEAST

Power fork, built for about \$60, moves part of 2,000 bird "cupette" flock to range shelters. It's also handy for loading logs, rocks, and manure, and plowing snow. Later a spray boom will be mounted on it.

## FARMING WITH

### One Arm

By  
Gerald Chapin

Here's how to use two wrenches with one hand. Put knee against one.

Hydraulic cylinders are essential to one-armed farming. This one, just behind tractor wheel, controls pickup of hay baler.

SOME TIME ago a young man walked into my office and introduced himself as Gerald Chapin, son of O. H. Chapin, a lifelong friend of mine.

When Gerald told me that he was running a farm, I looked at him in some amazement, for as he tells you in the following story, he is physically handicapped as the result of an exploding bomb during the war. Maybe you will think after you read Gerald's story that "handicapped" is not the right word, for in spite of the loss of his arm and other physical difficulties, Gerald is a very successful farmer. The story of what he is doing was so inspiring to me that I asked him to write it so I could pass it along to you.

Time and again I have met men and women, including my own wife, who through persistence and courage have been able to overcome or offset physical handicaps and still live happy and successful lives. Men, like nations, are at their greatest when fighting and conquering the most difficult odds. Gerald Chapin is an outstanding example. —E.R.E.

SOMEWHERE in the nature of every farmer there must be a streak of downright cussedness that won't let him quit, no matter what the odds.

When the drought blisters his crops, instead of giving up, he'll plant more. If his barn burns, instead of selling out and moving to town, he'll start hunting up his carpenter's tools.

And if he loses an arm while doing his hitch in the service, he may first consider taking a less strenuous job in a related field. But presently he'll end up back on the home farm, figuring out ways to do things with one hand. At least that's what happened to me.

There are those who say that a one-armed man who chooses as strenuous an occupation as farming to earn his livelihood must be a trifle 'teched'. I'll not argue the point. But

I've been a farmer since I helped as a boy with the farm chores and loaded hay behind a team of fast-stepping horses. To quit a job you've always liked is not easy.

It was in 1942 that my career at farming received a setback. I was in my sophomore year at the New York State College of Agriculture when the war came on full force. So at Uncle Sam's bidding I spent the next four years in the Army. My active service ended at the Anzio beachhead in Italy. It was there that a heavy demolition charge exploded in my right hand, shattering my arm to the elbow, impairing the vision of my right eye, and leaving me partially deaf.

It took the Army doctors more than a year to patch me up. And though they did their best, there seemed little hope that I'd ever do any more farming. I ended up with a hearing aid, and a steel hook for a hand. My medical discharge said I was 90% disabled.

But if I couldn't be a farmer I wanted to be as closely associated with agriculture as possible. So we went back to Cornell with the idea of training for a desk job in Extension work. I say "we" because the girl who had written me letters all during the war got tired of writing. She married me so she could

tell me things first-hand. The fact that I was a much battered specimen of manhood didn't seem to bother her at all.

My education progressed without incident, but I still clung to the hope that I might go back to farming. So I hunted up stories of other handicapped men and how they had succeeded at various difficult jobs. And I took up courses in welding, field machinery and farm structures that would be of help if I ever did go back.

By the time graduation day arrived I had about convinced myself that I could make a go of it. Then Dad decided he could use a partner on the home farm. That did it. We packed up notes and texts and headed home.

The three years that have passed since then haven't been easy. There have been problems to solve and difficulties to overcome. But I decided early in the game that what a man can do with two hands, I'd find a way to do with one. And so far I always have, though I do things somewhat differently than a two-handed person.

People are often amazed at the things I do with one hand. They don't stop to think that you use one hand mostly for holding things while you work on them with the other. With one hand you hold a bolt while you twist the nut, a nail while you hammer it, a can while you pry off the cover. So all you have to do is substitute a vice or clamp to do the holding.

To take the top off a can, I clamp it between my knees. The nail I hold in my hook. With tacks or staples I simply press the points into the wood (Continued on Page 29)

# For Abundant Harvests . . .

*MORE Cabbage*

*MORE Potatoes*

*MORE Beans*

## G.L.F. Plant Foods

**T**HE right fertilizer in the right amounts spells bigger yields at less cost per unit. More farmers every year say G.L.F. is the right fertilizer. This year, it's a good idea to get your fertilizer needs on the farm at least a few days before you plan to use it. Although supplies are fairly good, shortages of bags and transportation delays could hold up planting. See your G.L.F. Service Agency today—check the fertilizer recommendation chart, and make arrangements for the plant foods you will need. Cooperative G.L.F. Exchange, Inc., Ithaca, New York

# What It Takes to Grow Corn

**W**ITHOUT having all the facts, you might assume that the great interest in grass silage in the Northeast would cut down on the amount of corn grown. It hasn't worked out that way. Generally, you can produce more feed on an acre of corn than on an acre of grass, but it often costs more, due to the time required to plow, fit and cultivate.

To a considerable extent grass silage is being fed in the summer when pastures are short and in many cases in place of part of the usual hay ration rather than as a substitute for corn silage. On some farms, where grass is put in the silo, more corn is grown for grain. Altogether, more corn, rather than less, is being grown.

## What It Takes

Let's consider the important steps in getting a bumper corn crop. Good production per acre is one of the first steps in getting high production per man which, in view of labor scarcity, is essential this year. A good yield of silage corn is 9 tons to the acre but attention to a few details on corn on adapted soils can easily double that figure. Once 100 bushels of ear corn per acre was considered something to crow about, now many farmers grow double that amount.

First, there's the variety. Even if you are sure the entire crop is going into the silo, the old idea of growing the heaviest possible tonnage regardless of ears, is out. You can furnish water in water buckets for less money and with less work than you can in the form of corn silage. If there is a possibility that you might husk some corn in a normal season, choose a variety that will mature, and choose it from your favorite seed grower. If silage is your main, but not your only concern, choose a variety that will reach dough stage at normal silo filling time for part of your acreage, and a variety ten days earlier for grain. This, too, can be put into the silo if that seems best. In any event, choose a hybrid; tests show they yield better.

## Planting Rate

There have been some changes in recommended rates of planting in recent years, and these are affected by soil fertility and the amount of fertilizer used. When corn is planted so that ears will average  $\frac{1}{2}$  pound dry weight you will get heavier yields than when corn is planted either thicker or thinner.

In New York State, 18,000 stalks per acre are recommended on highly fertile soils, 14,000 on average soils. At that rate, ears should weigh about  $\frac{1}{2}$  pound. Corn planted  $8\frac{1}{4}$  inches apart in 42-inch rows or  $9\frac{1}{4}$  inches in 38-inch rows, will give 18,000 stalks per acre; planted  $10\frac{1}{2}$  inches apart in 42-inch rows or a foot apart in 38-inch rows will give 14,000 stalks. A pound of seed corn will contain from 1,200 to 1,500 kernels and you can figure about 80 stalks from 100 kernels.

There may be exceptions, but most dairymen seem to agree that it pays to fertilize corn well. Recommendations vary with soils, latitude and elevation, but here are some general rules to remember. The less manure you use, the more commercial fertilizer you will need. If you use manure without superphosphate, use more phosphorus in the fertilizer. Use more fertilizer on a timothy sod than on clover sod.

In New York you might decide to use from 150 to 400 pounds per acre of a 10-10-10 or double the amount of a 6-12-6 or 5-10-10. In New Jersey, the rate might be 300 to 800 pounds of 5-10-10 plus 300 pounds of nitrate of soda or other nitrogen carrier as a side dressing on sandy soils where little or no manure was used. Last year, so we are told, C. Daniel Way of Guilford,

Conn., used 20 tons of superphosphated manure and 400 pounds of 5-10-10 to the acre. A number of people who saw the field estimated that it would go 20 tons of silage to the acre.

## Discourage Crows

In some years, in some areas, crows can do tremendous damage in a corn field. The cost of treating seed with a crow repellent is small and is good insurance. Weed control in corn has always been one of the expensive operations, and the easier you can do it the less your cost will be. That immediately suggests chemical weed control which is now far beyond the experimental stage.

There are two methods of using 2,4-D weed killer on corn. One is to use it according to manufacturers' directions just before the corn comes up, called "pre-emergence." The other is to use the weed-killer when the corn is from 3 inches to 1 foot high, or even after it is a foot high, provided the spray is applied around the base of the plants and does not get into the center of the plant.

You will still need to do some cultivating, primarily because these weed-killers do not kill all grasses, although it will check some of them. Anyway on some soils, there is evidence that cultivating increases yields more than more weed control would indicate.

But however weeds are to be controlled, careful fitting of the soil will help, particularly several harrowings at intervals of a few days to kill weeds that have sprouted. If weeds are not controlled, yields will suffer, but once the corn gets a good start on weeds, the battle is won.

Another reason why more corn is being grown is that new equipment has made harvesting easier. In the case of silage, a field harvester cuts and chops

To grow a crop of corn like the one being inspected by Bruce Jones of Hall, N. Y., requires a number of essentials. Among them are good soil, adequate fertilization, proper seedbed preparation, a suitable variety, and good weed control. These essentials apply both to corn for silage and corn for grain.

it in one operation and a blower elevates it into the silo with no back-breaking lifting. Where corn is grown for grain, the mechanical picker is the No. 1 labor- and time-saver. In fact, the picker has lessened the cost of corn production to a point where corn deserves serious consideration as a cash crop. While most farmers do not grow enough corn to warrant buying a corn picker, it is possible in most areas to hire a picker, or buy one and do custom work to help pay for it.

## Steers with your tractor

Here's a man who's in command. His close-coupled, Allis-Chalmers mower guides with his tractor... makes straight, clean-cut swaths.

Quick-Hitch mower and tractor drive as a unit. No more hooking fence, ripping tree bark, or scraping gateposts.

You'll like this easier way of mowing for quick haymaking.

Allis-Chalmers V-belt drive mowers operate quietly. Make square corners. Back up. Hold to hillsides... no drifting.

Quick-acting hydraulic control. Sickle bar lifts high to clear objects. Safety-release features absorb shock of obstructions. Locks up for between-field or road travel.

Ask your Allis-Chalmers dealer about these safe-to-operate mowers.

"...Best quality grass silage I have seen..."

Says Farmer George Kroes  
Kaukauna, Wis.

From all over the land come enthusiastic reports on results obtained from the glass-surfaced steel A. O. Smith HARVESTORE. It makes farming easier, more productive, more profitable.

Typical is the comment of Mr. Kroes:

"The grass silage I have been feeding from my HARVESTORE is wonderful feed. It's the best quality of grass silage I have seen—and my cows really go for it."

For full information on this new system of farm management, mail coupon now!

### WHY MORE AND MORE PROGRESSIVE FARMERS ARE CHANGING TO HARVESTORE

**Saves waste!** Seals out air. Prevents spoilage of silage. Preserves carotene, essential food elements. Gives finest quality silage with "green pasture" food values.

**Saves labor!** Mechanical bottom unloader. No daily climb. And no maintenance—no painting inside or out.

**No freezing problem!** HARVESTORE delivers feed in any weather!

**Profits plus!** HARVESTORE is the key to a new and better system of farm management. Makes summer feeding practical. Means better herd health. More milk—more beef—more dollars.

**A.O. Smith HARVESTORE**

## MAC ARTHUR FIRED— A TRAGIC MISTAKE

I WONDER what the 60,000 families who have had boys killed or wounded in the Korean war thought about these sacrifices when they heard that General Douglas MacArthur had been fired by President Truman? Are they wondering, as many of the rest of us are, what the sacrifices were for? Truman, the State Department, the United Nations and the British apparently want to fight a stalemate war; MacArthur wanted to fight for a victory.

Every American will remember that one of the most dramatic and successful military campaigns in the history of the world was MacArthur's fight back up across the Pacific in World War II to recapture the Philippines and Japan and to bring the war in the Pacific to an end. Since then, in spite of the fact that he headed occupational troops, his policies were so constructive that he has won the tremendous respect and support of the Japanese people.

Then Truman opened the war in Korea, and MacArthur, as the commanding general in that area, took over. Under his leadership the Korean war was carried successfully to the 38th Parallel, and then, owing largely to the lack of support and overwhelming numbers of the enemy, the Americans and the few United Nations troops there had to retreat. Now, as everyone knows, MacArthur has advanced again, carrying the war successfully to the 38th Parallel and beyond. At the height of this success he has been relieved of the command, *the only General in American history who has been fired at the height of a successful military campaign.*

The trouble originates with the yak-yaking in the United Nations, which has been and still is a world sounding board for Russian politicians and propaganda. Another cause of the trouble with MacArthur is the influence on our State Department and on Truman of the socialistic, not to say communistic, leaders of England. Month after month, in spite of the American dollars that have been poured into England, the economy of that country sinks lower and lower due to the straight-jacket controls of socialistic leadership. In spite of all the help we have given England, its press and leadership are constantly critical of America and of our policies.

Now, to be sure, MacArthur has disagreed with our State Department. Who could agree? He knows that the way to fight a war is to fight a war with no halfway measures. The only thing Stalin and the Communists understand is force. The English, led by Chamberlain, tried appeasement in the last war and it failed. MacArthur has urged the support of a policy that would bring the war in Korea and in Asia to a successful conclusion. The government should have brought him home for conferences and worked out differences. We can't afford to lose him. But England and the politicians of the United Nations and our own State Department have had more influence on policies than the General and the boys who were on the job and fighting the battles.

It's about time for Congress, representing the American people, to realize that patriotism is at a low ebb; that there is a feeling of resignation which may develop into resistance on the part of the boys and their parents about submitting to the draft; that there is little desire on the part of citizens to buy government bonds, or to pay the ruinous high taxes, some of which are caused by government extravagance and socialistic schemes. It's time for our government to listen more to the people and their leaders and less to foreigners. And finally, if it is right to fire General MacArthur, then it is doubly right for Congress to clean out the misguided, inefficient, and socialistic leadership in Washington, and restore the confidence and support of the people in their government.

*By E. R. Eastman*

## ARE YOU SLOUCHY?

I DON'T KNOW about other races, but it would be hard to beat us Americans for slouchiness when we sit or stand.

My friend, William H. Danforth of the Ralston Purina Company in St. Louis, Missouri, has for years preached and practised the rule of thinking tall, sleeping tall, sitting tall, and standing tall. Now a release comes from the Medical Society of Pennsylvania emphasizing these same rules, particularly the importance of good posture.

One-third of our lives is spent in bed. Therefore, say the doctors, our bodies should stretch out to the greatest possible extent when in bed. Did you know that we are a little taller in the morning than we are at night if we "sleep tall?" A person sleeping normally will move about once in twenty minutes, but his postural line should remain straight. The mattress should not be too soft nor the springs too yielding.

Our worst posture however, is when we sit. Mothers and teachers could do much to help children learn to "sit tall," which means sitting well back in the chair with feet resting squarely on the floor, or with one ankle crossed lightly over the other.

When standing or walking tall, the head should be erect, the chin in, chest out, abdomen in. Good posture reduces fatigue and encourages health and efficiency. Practice it!

## FOR BOTH HUSBANDS AND WIVES

Says the *Unadilla* (New York) *Spokesman*:

**I know where my pay goes,  
I'm willing to attest.  
Uncle Sam gets his share,  
And my wife gets the rest.**

That's a little hard on the wife, for hundreds of letters received over the past twenty-five years convince me that not all of us men are quite fair in the way we handle the family finances.

There is no other one thing that makes more trouble between married couples than the way in which the money is divided and handled between husbands and wives. The way some women insist on handling all of the money and doling out a few cents to their men is absolutely wrong. And vice versa, many husbands have the same bad habit. Their wives seldom get a penny of their own to spend, and are criticized when they spend it.

Of course, there may be a few husbands and wives who cannot be trusted to handle money; some of the rest of us are too old to learn new tricks; but I earnestly suggest to all young married people that each treat the other as a real partner in handling the finances as well as in every other way.

## PASTURES HAVE NOT KEPT UP

A NEIGHBOR said to me that with a dairy worth anywhere from \$4,000 up, and with other necessary investments equally high, it was darn poor business to let the cows roam the bare hillsides and unimproved pastures that most of us have had in past years.

Putting it another way, he said that on most farms pasture improvement has not kept up with the other good practices of modern dairying.

Pasture improvement is good business at any time, but it is especially necessary now to offset the price squeeze between the dairyman's high costs of production and what he gets for his milk.

The first step, of course, is to get well informed on the subject. There are good bulletins available from the colleges of agriculture. Talk with your county agent or your local farm supply dealer, or write to AMERICAN AGRICULTURIST, Box 367, Ithaca, New York.

## THE DATE IS TUESDAY, MAY 1

MOST OF US do a lot of yak-yaking about government; few of us do anything concrete about it. Here is a suggestion:

Read the article on Page 1 of the April 7 issue. Then attend your school meeting—in New York State most of them are held this year on Tuesday, May 1, and take part in the business transacted there. I submit that there is no use complaining about taxes, schools, and town, county, state or federal government if that is all we do about it.

Later the organization "Freedom on the March" and AMERICAN AGRICULTURIST will do what we can to arouse your interest in attending and taking part in caucuses, town meetings, and in voting. But all we can do is to call your attention to the situation and to the facts. If you don't care enough to follow up your opinions by personal action, I can see no hope for democracy.

## WILL YOUR BARNS HOLD UP?

LAST December, James L. Sears of Baldwinsville, New York, secretary-treasurer of the New York Artificial Breeders' Cooperative, and one of the most public-spirited men I have ever known, ran a tractor against a supporting post in the basement of his barn. The post collapsed and brought down tons of hay on him and the tractor. The exhaust set the hay afire, and burned the barn and killed Mr. Sears.

We are now coming into another haying and harvesting season. Most barns are just not built to support the additional weight of baled hay and straw, to say nothing of the weight of modern machinery on the floors. For safety's sake take a look right now at your foundations, your floors and the supporting posts in your basements, and if there is the least doubt in your mind, put in additional supports.

## WHEN SHE IS LONESOME

"Dear Mr. Eastman:

I am so pleased with the little volume of Chestnuts which you sent me. I am a shut-in and alone most of the time in a small room upstairs. So I do get lonesome, and now when I feel the blues approaching, I'll head them off with your chestnuts. God bless you and yours."

DURING World War II a mother wrote me that after her son, who was a submarine commander, had returned to his ship after a visit home she missed the little volume of Eastman's Chestnuts from her reading table. Later her son wrote saying that he had "stolen" the little book, put it in the small library on the submarine, and that the crew read it more than any other book there.

Letters like these make this job of being your editor and life itself worth while.

## DO SOMETHING ABOUT DAYLIGHT SAVING

IT IS NEARLY time to start tinkering with the clocks again. We can understand why some people like Daylight Saving time, but why do they have to have a law to force it on all the rest of us who don't like it?

To most farmers, Daylight Saving is a real hardship and causes heavy losses. Therefore, no village nor small city largely dependent upon the surrounding agriculture for its prosperity should force Daylight Saving on farmers.

If you are opposed to it, why don't you do something about it through your local farm organizations? Hold a meeting, appoint a committee, and tell the village and city fathers how you feel about it. This is another practical way to make grass-roots government work.

See "A Visit with the Editor", Page 19.

## AA's Farmers' Dollar Guide

ON APRIL 5 at Ithaca, the directors of the New York State Farm Bureau Federation unanimously passed a resolution favoring discontinuance of price and wage control. It is extremely important that all farmers (and consumers if possible) understand the reasons back of this resolution. First, let's see what attempted controls have done to agriculture so far:

**PRICES:** Everyone agrees that little or no control of prices or wages has resulted. In fact, some maintain that both prices and wages are now higher than they would have been without controls. Many economists maintain, and many legislators agree, that in the long run price controls have never been effective. Yet voters demand them and they get them.

**FOOD PRODUCTION:** Farmers have reported intentions to plant cultivated crops far below the acreage recommended by the Production and Marketing Administration. While uncertainty as to labor and supplies had its effect, uncertainties about price controls also affected decisions of thousands of farmers.

Most recent worry of Washington planners is slump in milk production. While planners predicted 1951 milk production approximately the same as last year, actual production in recent weeks has dropped drastically. Uncertainty and demands of consumers that price ceilings be put on farm prices at levels below parity had their effects.

**DEMAND:** The natural result of price controls, if they work, is to increase demand. The law of supply and demand is based on the well-known fact that as prices go up, consumers buy less, until there is a balance between what's produced and what's consumed.

**MANPOWER:** Obviously, controls require manpower that is badly needed for production, and any action which uses manpower unnecessarily, thereby reduces needed production. It is equally clear that government attempts to control prices and wages must increase taxes, because the army of civilians that attempts to enforce these controls must be paid out of taxes.

**INDUSTRY:** We are emphasizing the facts of attempted controls on agriculture because that is what we and our readers know most about. But it is necessary only to talk to an industrialist to find that his business is affected in the same way. Where, then, is the benefit?

**WHAT NEXT?** Getting back to agriculture, what's the next likely move? We understand that PMA committeemen have been asked (or ordered) to go down the road and urge farmers to increase production. This again takes time of PMA committeemen that could be better used in production efforts. As has been pointed out by many economists, prices in a free market are the quickest, cheapest and most effective regulators of production.

More and more, subsidies on farm production are being suggested as one answer to the twin problems of cheap food to the consumer and fair prices to producers. The plan is to use them to kid the public into thinking they are getting cheap food, while at the same time encouraging the farmer to produce heavily. It might work out something like this: The consumer eventually pays \$2.00 for \$1.75 worth of food. He may pay the grocer or butcher \$1.50, but eventually his taxes will pay the farmer \$.25 as a subsidy plus another \$.25 or more to the government to administer the program.

Among farmer's objections to subsidies are: They are expensive; they give consumers a bad reaction toward farmers; they put too much power in government hands, particularly when consumers make up such a big majority of voters.

**ECONOMY:** Action toward cutting government expenses continues at a snail's pace. It has been pointed out that cutting appropriations for agencies by Congress fails to bring economy. It only results in deficiency appropriations at the end of the year. The only way to cut government expenses is to reduce government activities, and there are plenty of opportunities for that. For example, the report that "influence," rather than "merit," often determined Reconstruction Finance Corporation loans shocked the nation and resulted in proposals that R.F.C. be liquidated. But naturally there is pressure to continue it, and it will not be liquidated unless voters in overwhelming numbers demand it. Why not write your Congressman? He will listen, particularly if many of his constituents demand the same action.—Hugh Coslinc.

## The Song of the Lazy Farmer

YOU'LL never catch me looking sour about a little April shower; I never feel regret at all when gentle rain begins to fall, because I figure that I get a double benefit from it. For one thing, all those raindrops mean that things will soon be turnin' green and winter's bare, depressing sight will disappear 'most over night. The smell of ozone in the air foretells days that are warm and fair, with tree buds poppin' out all o'er and flowers bloomin' by the score, with pastures carpeting the land while small grain grows to beat the band.

But there is still another gain provided by an April rain which tickles me ten times or so as much as that it makes things grow. Whenever ground is soaked and wet, why then, of course, I cannot set upon a tractor seat all day and work my happiness away. As soon as it begins to storm, whenever puddles start to form, it means that I can quit right then and rest until it's dry again. So I say, let the rain pour down, why

should I growl or fret or frown? If crops ain't in, that is no crime—it means less work at harvest time.

# TOUGH GULFLUBE FITS FARM WORK

Protect your farm motors  
with this High Quality Motor Oil

Gulflube is your best oil buy for farm work, because...

1. Gulf's Multi-sol process purifies and stabilizes the oil.
2. Engines perform better with Gulflube's instant lubrication.
3. High lubricating value protects bearing surfaces.
4. Gulflube is an exclusive Gulf product made to exacting high standards from paraffin base Mid-continent crude oils.
5. Gulflube has high oxidation stability.

Gulflube is tough, rugged, and economical. We recommend it for the lubrication of gasoline engines of automobiles, tractors, trucks, farm lighting outfits, and other farm equipment. Gulflube is "a premium oil at a regular price."

Handy 5-gallon utility can, useful in dozens of ways, is yours when you buy Gulflube in this economical size. You should keep several on hand. You can use one to carry extra gasoline for truck or tractor, another for kerosene. Can has tilted spout for easy pouring, screw caps and wooden handle. You can never have too many utility cans around the farm.

### Ask your Gulf Supplier for Gulflube in the 5-gallon cans

For sound farm economy, REMEMBER to ask for these GULF PRODUCTS, too...

Livestock Spray • Tractor & Truck  
Tires • Good Gulf Gas • All-Purpose Farm Grease.

Gulf Farm Aids, Room 1509, Gulf Building, Pittsburgh 30, Pa.  
Send me, free, Gulf's NEW Farm Tractor Guide.

Make of Tractor \_\_\_\_\_ Model No. \_\_\_\_\_

**That's Clifford Bower on that tractor** giving me the high sign. I'm going to fill his tanks, drop off some Atlantic Motor Oil and Lubricants he asked for--and he can keep right on working.

And it's that new Atlantic truck I'm driving that makes this possible. Here, let me show you why.

## YOU KNOW WHAT YOU'RE GETTING FROM YOUR ATLANTIC FARM SERVICEMAN

**See these meter ticket printers?** They measure exactly how much gasoline, tractor fuels, kerosene or fuel oils I deliver and stamp the amount on the delivery ticket. Another thing, there's a tank and hose for gasoline and another for oil. So I can deliver both with absolute safety.

**And when Cliff and his wife** check over my delivery, they have a stamped ticket and an itemized bill. Yes sir, they've got a complete record of what they're getting. Isn't that the kind of service you want? You can get it from any of these new Atlantic trucks. But it would be a good idea to call right away. Here are the numbers to call--pick the one that's nearest.

Albany	Rensselaer 4-7138
Auburn	3-5641
Binghamton	4-4581
Buffalo	Victoria 1234
Corning	1326
Elmira	8104
Fulton	167
Malone	5
Oneida	811
Rochester	Glenwood 1620
Syracuse	3-5132
Watertown	4277
Wayland	2741

**Here I am setting off** some Atlantic Motor Oil and Lubricants. I've got everything that Cliff wanted--in the quantity he wanted. And I'm going to be able to do the same thing for the next stop... and the next...and so on. Because these new trucks hold plenty!

**P. S.** There may be an opening for a qualified man to run one of these new Atlantic one-stop farm services. If you know of someone, tell him to write The Atlantic Refining Company, Syracuse Savings Bank, Syracuse 2, New York.

# ATLANTIC

# Good Cows—Good Grass On a Good Hill Farm

By H. L. COSLINE

**T**HE village of Cuba in Allegany County, New York, is on high ground. Even so, when Ernest Witter starts home after delivering his milk he climbs and climbs. Yes, his is a hill farm but a good one. It lays well and for at least 30 years the crop land has been limed regularly. Mr. Witter's father was born here and died here, in fact it has been in the family almost 100 years.

To me the most interesting sight at the Witter farm was the family. But before I tell you about them let's review a few high points of Mr. Witter's farm practice.

This is a dairy farm with 30 milkers and 16 head of young stock. But when young Dave gets through school the herd will be increased to about 50, enough to keep him, his Dad and the hired man busy.

On this farm there is a real appreciation of the importance of roughage. On 13 acres of pasture, brush has been pulled out with a tractor and most of the area has had an application of 200 pounds of 0-20-20 per acre. Six acres have been seeded to birdsfoot and timothy and 7 acres to ladino and orchard grass. More pasture will be improved as fast as other farm work permits, thus letting the cows "harvest their own".

## Grass Silage

Every acre of meadow is covered with manure every year. The fact that the farm is heavily stocked with heavily bedded animals makes this possible. For a number of years grass has been put into the silo and one year a sample took top honors at the county fair. As Mr. Witter says, grass silage is put up the hard way with a green crop loader and pitchfork, but he likes it. He uses no preservative and allows the grass to wilt very little. In fact, he is more afraid of having it too dry than having it too wet.

The hay that is put up dry is field-baled. There is still one team on the farm but the major part of the work is done with two tractors and equipment to go with them. In addition to baling on the farm, some custom work

is done. Ernest estimated the amount as being about 10,000 bales.

Corn is also grown for ensilage and this year Ernest plans to try a couple of acres for grain if he can locate a variety he thinks will mature. Above the stable is a grain bin which, after threshing time last summer, held about 1,600 bushels of oats and barley. This mixture along with a protein concentrate is ground for dairy cow feed. Most of the fertilizer bought is 20% superphosphate but 300 to 400 pounds of a 6-18-6 is commonly used on corn.

## Real Improvement

Back in 1947 the herd average was 270 pounds of fat. In 4 years, through culling on the basis of D.H.I.A. records together with some purchases of foundation stock, this average has been raised to 368 pounds. Looking to the future Ernest has joined the local artificial insemination association. He now has two artificially bred heifers that are producing milk. One freshened just before Christmas and late in February was giving about 55 pounds of 4% milk daily.

Now let's go back to the family. When you hear that Mr. Witter is a farmer with 7 daughters and only 1 son, you may be inclined to commiserate a bit with him, but Ernest doesn't need any sympathy. He might admit under pressure that good fortune smiled on him to the extent of giving him a son early because Dave is already a big help on the farm. He has definite plans to go into partnership with his father and already owns a nice string of Holsteins: 4 already producing plus 2 bull calves and 4 heifers all registered in the name of a father-son partnership.

## Blue Ribbons

Dave has been exhibiting at 4 fairs—the State Fair, the Erie County Fair, the Allegany County Fair, and a local 4-H fair for several years—and his Dad feels that it has given him invaluable experience. What's more, Dave usually brings home his share of ribbons.

Two of the girls also own 4-H calves.

(Continued on Page 15)

From left to right: Ernestine, Esther, Ernest and David Witter. The heifer is Princess Pabst Pontiac Colantha just past 3 years, and who will have freshened with her second calf by the time you read this. She has been shown at Syracuse twice, once taking second in the 4-H class and last time placing right in the middle of a class of 32.

## FARM NEWS from DU PONT

## "Marlate" Offers New Advantages As SAFE INSECT KILLER

With vegetables, fruit and forage crops, more evidence each season points to the advantages of "Marlate" methoxychlor insecticide.

**It's Safe:** Not hazardous to people, to livestock or to plants. Doesn't harm even the tender vegetable or fruit foliage, and there's no problem of hazardous residues on crops, either for livestock or for people who eat the crop. That means it can be used *close to harvest*.

**It Works:** Kills cucumber beetles, leaf hoppers, flea beetles, cabbage worms, corn earworm, and many other vegetable insects; plum curculio, cherry fruit worm, codling moth, Oriental fruit moth, and other fruit pests. Also kills alfalfa weevil, lygus bug nymphs and other insects on forage crops.

**It Lasts:** One application is usually effective for weeks on the foliage you have covered. You use less chemical and save time and labor in application.

"MARLATE" is a powerful insecticide which, however, has the outstanding quality of being safe when used either as dust or spray. Under normal conditions it is not hazardous to people, to livestock or to plant life. See your dealer now for "Marlate" and other Du Pont pest-control chemicals. Ask him for free booklets, also, or write Du Pont, Grasselli Chemicals Dept., Wilmington, Del., or 350 Fifth Avenue, New York 1, N. Y.

## America's Busiest Farm Buildings

### MULTI-PURPOSE

STRAN-STEEL

# QUONSETS

Storing Potatoes in Maine

Corn Drying and Storage in Iowa

Dairy Barn in Minnesota

Housing Farm Machinery in Texas

Cottonseed Storage in Alabama

### FARMER'S FAVORITE . . . EVERYWHERE!

Quonsets are all steel. They are wind-resistant, fire-safe. They are quick to erect. They are reasonable in cost. (Total in-place cost will surprise you!) They are versatile. They are strong and long-lasting . . . made of arch-ribbed, nailable Stran-Steel framing.

All over America you see them . . . Stran-Steel Quonsets . . . on farms of all types and sizes.

There are many reasons for such preference for this busiest of all farm buildings.

The Quonset is versatile . . . perfect for crop storage, housing livestock or machinery, and dozens of other uses. More than that, the Quonset is an efficient, shirt-sleeved working tool that increases production, cuts legwork and back-breaking drudgery to a minimum.

Doubtless you know someone who has a Quonset building on his farm. We suggest you talk to him. Or call in your Quonset dealer and get a list of the farmers in your section who have solved the farm building problem—profitably—with one or more Quonsets. Use the coupon for valuable information on buildings best suited to your type of farming.

Quonset 32

Quonset 24

Quonset 40

Use this coupon for information about Quonsets in use in your kind of farming. (We will include the name of your nearest Quonset dealer, from whom you can get detailed costs.)

### THIRTY YEARS OF ROADSIDE SELLING

EXPERIENCE is an excellent teacher, and we've had plenty of it in roadside selling! Dealing with the general public is fun, as well as producing a good income. My folks' business is market-gardening and florist work. We also cater to a large number of tourists who stop to buy maple products. Most of the customers are pleasant. Once in a while a "stinker" takes the joy out of life. Thank the Lord, this doesn't happen too often!

Tact, tolerance, and hard work go hand in hand in keeping our business running smoothly seven days a week. Being dependable, courteous, and accommodating are big factors. We like people! This we find to be one of the main requisites of success.

Nowadays, nearly everyone figures his work by the hour. We don't consider our business in that way. Our days start at 6 A.M., and end at nine or ten o'clock at night. My parents are in their sixties, and they can beat a large number of the younger folks any day. Our business is purely a family affair. It has steadily grown from scratch; it is still growing.

—Mrs. Kathleen King, St. Johnsbury, Vermont.

—A.A.—

### FROM A READER

I have read with interest the article entitled "Taxes" in your Service Bureau of March 17. As I have had a case similar to the one you mentioned, I would like to point out the decisions which Lieutenant-Governor Frank C. Moore, former Chairman of the Assessment Board, has made.

He has stated that Assessors in New York State should find a yardstick which will enable them to assess all property in their tax districts at the same percentage of value in order to insure equitable assessment for all. The Board has repeatedly emphasized the fact that property currently sold must not be assessed at a different level than property which has not been sold.

If a person feels that his assessment is unfair, and it often is in the case of

an outsider coming into a town and buying property, he can take the case to the courts in a proceeding commonly known as certiorari. In this connection, it is of interest to note that the Legislature, at the last session, amended the law so that it is possible to recover all or a substantial part of expenses involved in such proceedings. The amendments referred to are Chapters 654 and 655 of the Laws of 1950.

My information, in the main, comes from communication with the State Board of Equalization and Assessment in Albany, N. Y., dated November 13, 1950, and January 2, 1951.

—A.N.G., New York

—A.A.—

### PRICES HAVE CHANGED

YOUR first editorial in the March 17 issue of AMERICAN AGRICULTURIST sent me to the safe to hunt up an old bill of sale from my father to his son-in-law when he started to work the farm on shares. I found it in my father's desk after he died in 1916. It is dated January 15, 1889, and lists the following:

#### SOLD TO F. C. HUMPHREY

One-half interest in 3 colts at \$ 88.00	
Mare Topsey	100.00
Brown mare and Liz	100.00
Two lumber wagons	60.00
Two plows—steel beam	10.00
Spring Tooth	10.00
Roller	5.00
Forks and shovels	5.00
Mowing machine	5.00
Bob sleigh	5.00
Harness	15.00
Hay rack	1.00
Hens	4.00
One-half interest in 3 cows	37.00

I do not remember too well the physical condition of this equipment, although I was seven years old at the time, but I do know that it was adequate to operate the farm. Probably less than \$100 was enough operating capital to carry from April 1 to harvest time.

The inventory of equipment on this same 125-acre farm now is \$10,000 and we do not have a single machine not needed for present operations.

—Ora Lee, Albion, N. Y.

These identical Ayrshire heifers were 11 months old when the picture above was taken. They were born April 3, 1949, at Dawnwood Farms, Amenia, New York, and were named Candy and Sandy.

The birth of twin calves, which occurs only about once in every thousand births, was used to test "Caf-Star" for growing calves. One calf was fed "Caf-Star"; the other was fed milk. At the end of 3 months, Candy, the one fed milk, had gained 103 pounds and Sandy, on the formula feed, had gained 112. At 5 months they weighed just about the same—Sandy, 318; Candy, 315—but both of them were around 78 pounds heavier than the average calf at 5 months. The cost of feeding Candy on milk for 5 months was \$57.33, and the cost of feeding Sandy on "Caf-Star" was \$14.95.

# THIS ONE GETS TOP SCORE! SHELL WEEDKILLER 130

... your best bet for  
**all-weed control**

Shell Weedkiller 130 is a powerful emulsifiable concentrate ... with a double-barreled action against all varieties of weeds. The two-way action comes from its special, highly aromatic weed-killing oil and the extremely effective pentachlorophenol it contains. Since it is a concentrate and contains its own emulsifier, Shell Weedkiller mixes readily with water to form a low-cost, large coverage emulsion.

Shell Weedkiller 130 is widely used in vineyards ... it effectively controls the weeds, replaces cultivation and hoeing, eliminates mechanical damage to roots.

As a general weed killer this versatile Shell herbicide kills weeds along roads and ditches, rights-of-way, hedgerows and farm yards. It is aiding in the control of mosaic disease by eliminating wild hosts of virus-carrying aphids.

Shell Weedkiller 130 is 98% active ingredients ... there's no waste. Its rapid evaporation allows maximum flexibility in timing the applications for greatest effect.

Write for bulletin and latest application data on Shell Weedkiller 130.

## Spring Work Slowed by Weather

By L. B. SKEFFINGTON

IT IS not an early spring by farm standards in Western New York. By mid-April there had been a few warm growing days to start pastures and wheat. Heavy, washing rains had left the ground in many sections too wet for farm operations. Practically no plowing was noticed, except in a few favored locations.

It is too early for any over-all picture of the condition of winter wheat. Some sections report an apparently light stand and some yellowing, attributed in large part to absence of snow during cold spells. At best, it does not seem that pastures will be any earlier than a year ago.

On the way north from Florida recently it seemed to me that it was a generally late season. Florida reported the coldest winter in a great many years. Through several southern states we saw very little plowing, whereas in some other years there was much activity. Frosts had done considerable damage to peach buds, and high water had plagued many areas.

### Seed Potato Market

When I arrived in Florida, Hugh Humphreys, a New Hartford, N. Y. potato grower, took me for an exploratory trip through the Hastings potato area. Here we saw hundreds of acres of spuds nearing the harvest stage, together with a great amount of cabbage. The latter had been bringing a good price, partly as a result of the Texas freeze, but prices were easing off.

Main concern of the potato growers was the harvest labor situation. Usually the harvest starts after the Homestead area farther south is cleaned up. This year, cold weather delayed growth farther south, so that harvesters from the Homestead area were not moving northward.

I was particularly interested in fields of potatoes grown from New York seed potatoes. This is a new venture in the Hastings area, developed during the past two years. Formerly all of the seed came from Canada or Maine.

### Complain of Bruising

I asked some of the growers if they expected to continue to use New York seed, or more of it. They said it depended upon yield; that so far they had not had enough experience to know about that. The complaints they had against Maine and Prince Edward Island seed were too much handling; hauling to shipside in the North, and rehauling from Jacksonville. They thought New York seed could be brought south cheaper, and with less damage, as return loads in trucks that hauled citrus fruit and vegetables to northern markets.

Humphreys and I heard criticism about one lot of New York seed that reached the planting area and was found to be inferior. Some way or other, it had not been inspected. Growers pointed out that such seed could ruin the prospects of New York seed growers; that bruises or defects quickly show up in the hot climate. They said that if New York growers want to develop a potentially great market, the first thing to do is to insure the quality of the seed pack.

H. J. (Red) Evans of Georgetown, manager of the New York "Blue Tag" seed association, has been down there working on this and is alive to the needs of the area.

### Tomato Prices Up

The New York Canning Crops Cooperative has invoked its membership clause by which growers may sign tomato contracts with processors only after they have been approved by the tomato committee. A number of such contracts have been approved, with prices running up to \$40 per ton for Number 1 grade.

It is early to say whether the government's goal of a 35% increase in tomato acreage is going to be reached, or whether there will be 40% more sweet corn. The thing which seems to bother many growers is the uncertainty of harvest labor.

### Find Promotion Pays

I am sometimes puzzled by the attitude a few farmers take toward contributing funds for Milk-for-Health, apple promotion, or to develop markets for crops they produce. In Florida, growers have been paying two cents a box on oranges for an advertising fund. When I was down there, plans were under way to increase it to three cents on most citrus, and to five cents on tangerines and Temple oranges. I talked with a number of growers and they told me that money spent for advertising had saved their industry.

We drove for miles through Lake County and adjoining counties and saw hundreds of acres of new citrus groves. I stopped here and there to inquire where they expected to sell the fruit. Generally the answers I got indicated belief that frozen concentrate and advertising made an ever-expanding market.

### Egg-Eating Champ!

Duane New of Prattsburgh is the Steuben County 4-H egg-eating champion. He devoured 36 eggs to win the title. Donald Gifford of Branchport was runner-up, with an appetite for 23 eggs. Some of the girls tried it, but quit after eating a dozen. Prof. Robert C. Ogle of the Cornell poultry department was judge.

When the Brown Swiss Breeders came to Cornell on April 20 for the annual Empire State Brown Swiss Show and Sale, they had an opportunity to bid on this heifer calf. The calf was donated by Mr. and Mrs. Jack Conner of Ithaca and the sale price will go into a fund to endow the H. E. Babcock Memorial Professorship in Nutrition at Cornell.

The heifer is Sunnygables Windsor Belle, born July 10, 1950. Her dam, Wingood View Eva, has a record of 9,510 pounds of milk and 410 pounds of fat in 360 days at the age of 2 years and 7 months.

The calf's sire is Cornell Columbus Windsor, a proved sire now being used by the New York State Artificial Breeders Cooperative. Jack and calf are shown above.

# Save with Chevrolet Advance-Design Trucks ... engineered for your work!

MORE CHEVROLET TRUCKS IN USE THAN ANY OTHER MAKE!

*First in demand  
First in value  
First in sales*

1951 Advance-Design Chevrolet trucks are built to save you money. They're engineered for the rough and tough work—for the heavy loads and the long, hard pulls—with power, strength and stamina that keep them on the job longer. Here are trucks with extra strong frames to take the big loads . . . super-efficient valve-in-head engines that cut gas and oil costs . . . new, improved design brakes for greater safety and longer life. In every way, the 1951 Chevrolet truck is right for you, and for the hauling you do. See them at your Chevrolet dealer's!

CHEVROLET MOTOR DIVISION, General Motors Corporation, DETROIT 2, MICHIGAN

(Continuation of standard equipment and trim illustrated is dependent on availability of material.)

#### Get more horsepower at the clutch

Chevrolet heavy-duty models with Loadmaster engine have greater horsepower at the clutch than any of the principal standard-equipped conventional makes in their weight class, 14,000 to 16,000 lbs., gross vehicle weight.

#### Cut your costs on gas and oil

The high efficiency of Chevrolet's great valve-in-head engines means that fuel burns more evenly and smoothly. This means more miles per gallon, less money spent for gas, important savings on all truck operations.

#### Save on purchase price—gain on trade-in

As America's lowest priced line, Chevrolet saves you money right at the start. Yet you save again at trade-in time. Traditionally, as America's most popular truck, Chevrolet has a greater trade-in value with dealers everywhere.

**Check Chevrolet's Advance-Design Features:** TWO GREAT VALVE-IN-HEAD ENGINES—the 105-h.p. Loadmaster or the 92-h.p. Thriftmaster,—to give you greater power per gallon, lower cost per load • POWER-JET CARBURETOR—for smooth, quick acceleration response • DIAPHRAGM SPRING CLUTCH—for easy-action engagement • SYNCHRO-MESH TRANSMISSIONS—for fast, smooth shifting • HYPOID REAR AXLES—for dependability and long life • NEW TORQUE-ACTION BRAKES—for light-duty models • PROVED DEPENDABLE DOUBLE-ARTICULATED BRAKES—for medium-duty models • NEW TWIN-ACTION REAR BRAKES—for heavy-duty models • NEW DUAL-SHOE PARKING BRAKE—for greater holding ability on heavy-duty models • NEW CAB SEATS—for complete riding comfort • NEW VENTIPANES—for improved cab ventilation • WIDE-BASE WHEELS—for increased tire mileage • BALL-TYPE STEERING—for easier handling.

## Hoosier farmer says... "Swift's New Process Blenn

produces high yielding, quality soybeans"

"I have been using BLENN on soybeans for the past few years with excellent results. When not limited by weather and weeds, I have found BLENN will consistently produce 30 bushels or better of quality soybeans per acre.

"BLENN safeguards our crops. Its completeness produces high quality and early maturing soybeans and small grains."

Adlai Wolf,  
Reynolds, Indiana

Mr. Wolf's experience with BLENN, Swift's specialized crop maker, has been duplicated by thousands of other farmers who raise soybeans, corn and small grains. It helps them get bigger yields of better quality.

Here's why BLENN works so well. Feeding BLENN to crops is like feeding a good supplement to livestock. The growth elements in BLENN balance the natural plant nutrients in your soil. Then your crops get all essential growth elements needed...and that means higher yields, improved quality, and more money from every acre.

### BLENN is chemically hitched

New Process BLENN is made by an exclusive method developed by Swift. Complete mechanical mixing is followed by complete chemical processing. All growth elements in the formula become chemically hitched together in each granule. Growth elements can't separate out as your planter joggles over the field.

### More uniform 4 ways

Swift's New Process also makes BLENN more uniform in four important ways: 1) uniform blending, mixing, curing; 2) uniform distribution through your machines; 3) uniform freedom

from caking, lumping, bridging; 4) uniform feeding of your corn and other crops.

You'll want to make sure you get all the New Process BLENN you'll need for your corn and grain crops. Shortage of plant food materials is again a possibility. So see your Authorized Swift Agent or dealer right away and order your BLENN.

### Do your pastures need fertilizing?

Do you know how you can tell what plant foods can do for your pastures? Think back to last spring. Remember how the pasture was spotted with small areas of greener, taller, more lush grass?

Those areas had been fertilized—by manure from the cows. Commercial plant foods can do the same thing for your whole pasture.

To help you grow better grass—America's greatest crop—we have prepared an informative new booklet, "A Guide to Better Pastures." We'd like you to have a copy. Please write to Swift & Company, Plant Food Division, Chicago 9, Illinois, and we'll send your copy. This booklet is free!

## A FORUM FOR Backyard Gardeners

## Building a Small Hotbed

WELL, I finally got that electric hotbed started that I mentioned some time ago. If I had made up my mind thoroughly last summer, the job would have been handled differently. As it was, I made a temporary installation somewhat as follows:

On a stone terrace next to the garage I put down some inch boards and covered them with newspapers. Then I hunted around for some boards of the right width and built a frame to fit one of my 6'x3' storm windows. It was pretty cold one night, so I covered the storm window with some old rugs. Next morning, I found one of the panes cracked, and there went the saving on that deal!

To get back to the construction, after the framework was built, I put in 60 feet of lead-covered cable in a grid fashion. That's enough for a 6'x6' hotbed, but I was told it was the right amount to use even in a smaller bed. If I want to double the capacity later, I won't have to buy any more cable.

I covered the cable with a couple of inches of sand and hooked up the cable and thermostat as you see in the picture. This being a temporary installation, I borrowed a section of rubber-covered cord from my hedge trimmer and ran it to a socket in the garage.

### Soil for Flats

I was now ready to nail some flats together and plant my seed, but first I had to get some soil. This also was not done last fall because I didn't decide to have a hotbed until after everything was frozen up. But it didn't hold me up any. One warm day about the first of March, I went out along the fence beside the garden and with a spading fork I dug up some orchard grass sod and shook the dirt from the sod into the wheelbarrow. Then I mixed in a little peat moss (it is easy to get too much) and a double handful of 5-10-5 fertilizer to a bushel of soil. I figure that this will make good plant-growing soil. At this writing, most of the seeds, even slow germinating flower seeds, have come to life, and tomatoes and some other plants have a good start.

Probably, from a strict financial point of view, I couldn't justify a hotbed at all, but with me, gardening is partly vegetables to eat and partly flowers to enjoy. When my friends tell me that they haven't time to garden, I tell them that I haven't time to play golf. So I feel justified in charging part of the cost to fun and I'm sure that eventually I will break even on the

plants grown instead of purchased. As the season develops, I hope to keep you informed.

\* \* \*

### Abundant Flowers

Those of you who are interested in a lot of flowers for a little work will have the best luck by planting such annuals as cosmos, zinnias, calendulas, and marigolds. If you want more variety, there are others that you can buy as plants which you can start either in the house or in a hotbed. These include ageratum, annual dahlias and petunias. You can grow petunias from seed sown in the soil, although they will be a little late in coming into bloom.

To the above annuals you can, of course, add perennials which, in many respects, are most satisfactory from the standpoint of rows of flowers for a little work.

\* \* \*

### Wild Morning Glory

On page 29 of your March 17 issue there is an inquiry on how to control wild morning glory in the garden. The answer is 2,4-D, with a BUT—

Do not spray. Get a bottle stopper such as the wife uses when she irons clothes. Insert this in a bottle and sprinkle the 2,4-D solution on the plant as it emerges; or if you uncover the root, sprinkle the root and leave it uncovered. With a sprinkler like this you can work close to any garden plants without doing them any damage.

—O.P. Jordal, Mexico, N. Y.

\* \* \*

### Kill Woodchucks Now

If you have a stone wall or other woodchuck havens near your garden area, the quicker you get at them after they awake from their winter sleep the less damage they will do. Several different procedures have been recommended by our readers. Among them are the use of woodchuck bombs (if you are a farmer this method runs into some little cash), the use of 1 part of lead arsenate powder to 9 pounds of salt, and soaking a burlap bag with gasoline and pushing it back in the hole. Some readers claim this will kill the woodchucks; others take the further step, (after taking the precaution of standing one side) of throwing a lighted match into the hole and then covering the hole with dirt as soon as it can be done.

\* \* \*

Locating the garden near the house makes it possible to spend a few minutes in it often.

—The Backyard Gardener

# "My milk run costs me only 1½ cents per mile!"

—says RUDOLPH DUBCAK  
Dairyman, of Crosby, Texas

He drove a 1950 Ford F-1 Pickup equipped with POWER PILOT in Ford's nationwide Economy Run. He says, "The Power Pilot gives me more miles per gallon with maximum power."

Dairyman Rudolph Dubcak keeps a sharp eye on hauling costs . . . runs a thrifty Ford Six Pickup. "My Economy Run records showed me the overall economy of my Ford Truck. For example: In six months I traveled 7083 miles with an average load of 700 lbs. My running cost for gas, oil and maintenance with no repairs was \$106.48 or only 1.5 cents per mile!"

Like others who rely on Ford for greater savings—you'll like the low-cost service you get from your local Ford Truck Dealer. And, for more facts on the trucks that last longer *and* save you money every mile—mail the attached coupon today.

New Ford F-1 Pickup for '51, like Dubcak's truck, is the No. 1 *Economy* value of Texas and all America! Remember, with

a choice of over 180 models, there's a thrifty Ford Truck to fit *your* job! You have a choice of V-8 or Six—up to 145 horsepower!

## FORD TRUCKING COSTS LESS

because FORD TRUCKS LAST LONGER

Using latest registration data on 7,318,000 trucks, life insurance experts prove Ford Trucks last longer!

### See Your Local Ford Dealer

Conveniently Listed in the Telephone Directory

TEXAS  
Report No. 1572

Five star performer in the Lone Star State! Dubcak's Ford Truck helps him deliver milk daily—on schedule, hauls hay, other feeds, too!

## POWER PILOT helps DAIRYMEN hold down hauling costs

The Ford Truck Power Pilot is a simpler, fully-proven way of getting the most power from the least gas. This carburetion-ignition system automatically meters and fires the right amount of gas, at precisely the right instant, to match constantly changing speed, load and power requirements.

Unlike conventional systems, the Power Pilot uses one control instead of two, yet is designed to synchronize firing twice as accurately. You can use regular gas . . . you get no-knock performance. Only Ford in the low-price field gives you Power Pilot Economy!

# New Automatic Model of AMERICA'S FAVORITE BALER

CASE MODEL "NCM-T" (TWINE)

Fast work and unusual capacity for producing well-shaped, sturdy bales made the Case Model "NCM" Slicer-Baler the favorite among hay growers everywhere. The new, fully automatic Case Model "NCM-T" has all the advantages of the "NCM" plus a fast, simple, dependable self-tying unit.

● **Makes firm, neat, full-weight bales, tied to stay tied** with heavy-duty twine. A continuous stream of bales from bale chute to wagon hustles your haying, helps you keep haying costs down.

● **Bales are ventilated for fast, even curing** all the way through. Ventilation lets air into the otherwise dense bale center, lets moisture out. Helps preserve proteins, vitamins, bright color.

● **Bales are sliced—easy to feed.** Slices come apart with less shattering of valuable leaves. Case balers are built to guard the leaves all the way, from windrow to feed rack or manger.

● **A still faster, easier way to high quality hay.** The new, fully automatic Case Model "NCM-T" Slicer-Baler saves time, saves labor, saves expense—helps you make better hay faster than you ever could before.

**Simple tying unit** has both knotter heads on a single shaft. Far fewer parts than most knotters, yet takes care of considerable variation in hay. Often can be used in one crop after another without need for adjustment. Factory-tested for dependable operation. High tensile strength and uniformity of Case heavy-duty twine permits firm, full-weight bales, consistently tied to stay tied.

**Visit your Case dealer.** Find out more about the new, fully automatic Model "NCM-T" Baler. Also see the Case 7-foot Tractor Mowers and the fast, gentle-working Case Side-Delivery Rake that makes light, fluffy, quick-curing windrows.

# PARATHION and Related Insecticides\*

By PROF. R. W. LEIBY  
Cornell University

**T**HE insecticide parathion and its close relative TEPP have become of age. Three years of grower usage have demonstrated the value of these bug killers chemically known as organic phosphate compounds. Their successful performance has greatly stimulated further research in this group of chemicals. From this research several new insecticides are about to appear for extensive field testing.

TEPP was the first of the phosphate compounds to reach us from Germany, followed closely by parathion to be perfected and developed in this country. Both are excellent killers of aphids, mites, leafhoppers, bean beetle, thrips, and some caterpillars. Parathion has the advantage of having a somewhat wider range of insect kills, of having four to six days of prolonged killing power after it is sprayed or dusted on foliage; and it can be formulated into a stable wettable powder or dust. TEPP lacks extended killing power. Yet this can be considered a positive advantage at times when it is necessary to eliminate an insect such as aphids on cauliflower within a day or two of harvest.

## For Peach Trees

The known kills of parathion now include all insects that affect peaches—the fruit-infesting curculio, the twig and trunk-burrowing borers, the foliage-sucking scales and aphids. Entomologists of some states suggest parathion as the only needed insecticide for the control of all peach insects.

Same thing is true for the insect complex of lima beans.—Three to five treatments with parathion will keep under control bean beetles, black aphids, spotted mite, leaf roller, leafhoppers, and flea beetles. If put in the soil with the planted seed it would probably prevent maggot injury to the sprouting seed.

Possibly because of its lack of any lasting effect, TEPP appears slightly inferior to parathion when a single insecticide is wanted for a given crop to eliminate its variety of insect pests. On the other hand grower usage of parathion has been of notable help in extending the useful field of TEPP.

## Dangerous to User

Both parathion and TEPP are hazardous to the user. They must be handled with extreme care. They are readily absorbed through the skin. In a few instances their use has proven fatal when they were handled carelessly. The manufacturers of both products have spent hundreds of thousands of dollars to educate the public on how to use them safely. This education has included instructions to the medical practitioner that atropine is the antidote for symptoms of poisoning by these insecticides.

Use hazards have stimulated research with related compounds which might be safer to the operator. What is desired is to lessen these hazards yet retain the high degree of insect kill. Metacide is a compound that shows

*\*Efforts are being made by manufacturers to make them safer for the user. They are trying to have plants absorb the insecticides so that insects are killed as they invade the plants and feed upon them.*

A canister type of respirator and "cover-all" clothing should be worn when spraying any of the phosphate insecticides.

promise in this direction. It is to be offered for extensive field testing this summer. Its manufacturers claim that the emulsifying agent used in its preparation makes it safer. It employs some parathion in its make-up plus much of a related phosphate chemical.

Metacide appears to have insect killing power that is just about equal to parathion and TEPP. It is claimed by its discoverers that under field conditions Metacide disappears from the surface of foliage sprayed with it in a matter of hours, but that it remains active by being absorbed in the plant tissues to kill insects for two to four days after an application.

Following Metacide closely came an insect killer developed in this country and known as EPN. Its manufacturers believe it to be the safest to the user of all these phosphate compounds. Many entomologists tested this organic phosphate compound in the field last year. It has longer residual effect than parathion or TEPP. Reportedly it is equal or better than parathion for mites, codling moth, and plum curculio; but considerably less effective against two other apple pests—bud moth and leaf roller. It will be available for further field testing this summer.

## Other Killers on Test

Another group of two insecticides related to parathion is being acclaimed. One, Pestox, originated in Germany. The other, Systox, was developed in England. They are known as systemic pesticides. They are absorbed into the plant tissues when sprayed upon foliage. Insects like mites and aphids are killed by contact during the spray operation. Other mites or aphids visiting the sprayed plants within four to seven weeks afterward are killed when they feed upon the foliage. Whether they will work this way on other kinds of insects appears doubtful.

I had occasion to test these two compounds last summer. I applied the Systox and Pestox side by side to well grown potatoes infested heavily with aphids. On a third swath of rows I used parathion. Sprays were applied with a power sprayer. There were twelve long rows to each plot.

The Pestox gave an almost immediate perfect kill. It took nearly two days to get an equal kill with the Systox. The parathion gave its usual satisfactory kill of the aphids.

For four weeks no aphids were able to re-establish themselves on the potato vines sprayed with the two systemics. Where the parathion was used there was a repeat build-up of the

(Continued on Opposite Page)

## NEW IMPROVEMENTS MAKE GRANGE SILO A BETTER INVESTMENT

**SAFETY FIRST**  
... is the keynote in the new SAFETY platform shown. The hinged floor with waist-high supporting frame lets you climb securely, safely, every step of the way. Other Grange features assure safer, easier setting-up and filling and cost-free maintenance.

**DEPENDABLE LONG-LIFE Features**  
Grange Concrete Stave Silos have proved in use that their better modern construction pays dividends in long life and dependability. Saves time and money. You'll SAVE, too, by joining the thousands of satisfied Grange owners. GRANGE costs less — gives you more.

## Parathion and Related Insecticides

(Continued from Page 14)

aphids to the point where the grower thought this plot ought to be sprayed again. At the end of four weeks the vines had to be killed for harvesting.

Right now it looks like a seed potato grower could make three or four applications of one of these systemics to his vines during the growing season and keep all aphids off of them. If so he could expect to grow seed free of the virus diseases known to be transmitted by the aphids.

The test was repeated with Systox only, on well grown cabbage some of which were exceedingly badly infested with the cabbage aphid. Again the kill was perfect and immediate.

### Lasting Protection

Two weeks after the spray treatment I placed cabbage leaves infested with thousands of aphids procured from a garden on some sprayed plants. They perished as they fed upon the sprayed plants. This transfer of live aphids was repeated four weeks after the spray treatment. A few days later we saw that a few colonies of four to ten aphids each were able to establish themselves.

These two systemic pesticides show promise in handling mite and aphid problems on apple. In a field test, Pestox, when used in rather strong concentrations, kept the green apple aphid from re-establishing itself for seven weeks. Systox also looked good against this aphid, and mites too.

None of these newer phosphate compounds, aside from TEPP and parathion, is ready for grower usage except for field appraisal under the supervision of an entomologist. They need approval by federal and state authorities for labeling and sale. This will be forthcoming only after there is reasonable assurance that they will measure up to claims as effective pesticides, that they can be used with safety by the one applying them, and that no harmful residues lurk in crops to be consumed by the public.

All of these phosphate type of pesticides must be handled with utmost care by the one using them. A suitable respirator is a 'must', as is full body coverage with water resisting clothing. In greenhouses where the aerosol form of some of these insecticides is commonly used now, operators always wear a full-face gas mask. It is essential for complete safety.

Toxic symptoms to warm-blooded animals brought about by the absorption of these insect killers are headache, nausea, chest tightness, stomach cramps and blurred vision. Your physician knows that atropine is the antidote.

— A. A. —

## Good Cows—Good Grass

(Continued from Page 7)

Esther, 17, has been a 4-H Club member for 3 years and owns 4 animals. Ernestine, 13, is now raising her first calf.

Along with managing the farm and raising a family you might logically conclude that Ernest might have little time for community activities; however in some way he finds the time. Seldom on a Sunday will you find the family absent from church. Ernest has been a Grange officer; he attends local farm meetings and some that are state-wide, and he is not afraid to stand up and speak his piece.

Yes, there is plenty of hard work on the Witter farm. No one could be there fifteen minutes without arriving at that conclusion. What's more important, a look around shows a well organized, well managed farm, and a happy and contented farm family.

## Get **TWICE** the building in **HALF** the time

Any type of covering may be used—wood shingles, composition roofing, metal roofing.

## Build with RILCO UTILITY RAFTERS

“Just about twice as strong as buildings erected the conventional way!” So say farmers about their Rilco-framed machine sheds, storage buildings, barns. Rilco replaces old-fashioned rafters, braces, posts with glued laminated rafters continuous from foundation to roof ridge. This means greater resist-

ance to wind and snow loads and 100% usable, post free interiors. Rilco Rafters go up much faster because they are cut to exact lengths, drilled for hardware. No cutting or fitting needed.

Beat the spring building rush by talking to your Rilco dealer about the new buildings you need.

# Let's Get Our Eyes Open!

Excerpts from a statement in the New England Letter, published by the First National Bank of Boston, which we hope will get you good and mad!

"THE Administration has proposed that \$71.6 billion of taxes be raised for the fiscal year beginning July 1, 1951. This is nearly as much as total national income for the pre-war year 1939. To finance our defense program, high taxes are inevitable and every effort should be made to operate on a pay-as-you-go basis. Since this will mean sacrifices on the part of everyone, it is highly essential that the Federal Government as well as all political subdivisions should cut non-essentials to the bone.

"Nevertheless, we are told that the budget is 'tight' and that all items are sacrosanct. Various authorities, liberal as well as conservative, however, contend that a large amount of 'fat' could be cut away without impairing the functioning of the Government machine. Estimates on possible reductions in Governmental costs average around \$7 billion. This would be a substantial saving and is equivalent to total Federal expenditures in 1938.

## Shocking Waste

"The findings of the Hoover Commission revealed shocking waste, overlapping, duplication, and gross inefficiency of the multitudinous Government agencies and commissions and of antiquated and slothful methods of accounting. If any private business had carried on its affairs in as slipshod a manner, it would have gone broke and been subjected to prosecution for juggling figures.

"A few illustrations will indicate the slackness that prevails in the Federal Government.

"In order to avoid having a surplus, most agencies indulge in a splurge of spending at the end of the fiscal year.

"The cost of paper work exceeds the cost of individual items that go to make up one half of the three million purchase orders each year.

"There are, on the average, about 3.6 typewriters to every worker in the Federal Government who uses one.

## Double Trouble

"The cost of construction of Federal hospitals is \$30,000 per hospital bed as against \$16,000 for private hospitals.

"Employees in the Veterans' Administration handle on the average only about one fourth as many insurance policies as are handled per worker in private insurance companies.

"The importance of a department is usually gauged by the number of persons employed rather than by the volume of essential work performed, with the consequent inducement to overstaffing.

"The number of persons on the Federal payroll in the last two decades has increased from around 600,000 to 2.2 million. This represents a gain of 261 per cent, or eleven times the rate of increase in the population of the United States during this period.

"Classified Federal employees are entitled to five and one-fifth weeks' vacation and three weeks' sick leave each year, or about twice the allowance to the workers in private enterprise.

## Common Sense

"There are several thousand highly competent employees in the Federal Government and many of them are

underpaid. The situation could be substantially improved by upgrading the deserving and cutting down on the labor force. Without entailing any hardship or sacrifice on the part of those employed, this could be brought about by vigorous adherence, whenever possible, to the 'no hiring' policy when vacancies occur and to transferring workers now employed in the less essential Federal services to the needed defense agencies instead of recruiting help from a tight labor market.

"More than 500,000 workers leave the Federal service each year for one reason or another. By pooling the available personnel and assigning the workers wherever they could be most effectively utilized, it would be possible in the course of a comparatively short period to bring about a substantial reduction in the number of Governmental workers without sacrifice of essential services. Since Federal payrolls of civilian workers exceed \$7 billion, it is obvious that the taxpayers' bill could be considerably reduced under such a reorganization plan. Similar action should be taken in state and local governments.

## We Asked for It!

"But all the waste cannot be laid to Federal employees. For nearly a decade and a half the dominating philosophy of this country has been to turn to the Government for hand-outs of one kind or another and this attitude has been encouraged by the Administration in power. As a consequence, all classes of pressure groups from every section of the country have made shameful raids on the Treasury to get their share of the 'spoils' apparently on the theory that they are getting something for nothing. But this money is collected from the taxpayers in all sections, and then portions are distributed back in the form of grants to the states, with strings attached."

\* \* \*

If the comments you have just read do not stir you up to the point of at least writing a few letters to congressmen and senators, then we don't know what will!

Few jobs are slower or more difficult than cutting government expenses. However, the job can be done if every citizen will insist on it. This insistence must be directed at your congressman and senators and to be effective your suggestions must apply to government expenses that affect you or the group to which you belong. Nothing will be accomplished by asking that the other fellow do all the saving if, at the same time, you rush to the defense of every government activity that affects you.

## It Can Be Done!

Editor Eastman said in an editorial February 3 that even great leaders of the Democratic party like Senator Byrd of Virginia say 7 billion dollars can be cut out of the Federal budget. Editor Eastman said that we can start by turning "thumbs down" on such socialistic schemes as:

The Brannan Farm Plan; socialized medicine; Federal aid to education; subsidization of agriculture which would be followed by iron controls; further nationalization of electric power; and the expansion of government ownership and operation of business.

# "The G.L.F. Stable Cleaner has licked the meanest job on my farm."

— CLIFFORD BARIGHT, Poughkeepsie, N. Y.

**T**HE JOB that has worn out more farmers before their time, caused more aching backs, weakened more hearts, made more hired men mad—is the day-in day-out, never-ending chore of cleaning out the stable. Hard work, dirty work, work that comes first thing in the morning so that a man is tired out before he really gets started. More than three years ago G.L.F. set out to see if that job could be licked.

The first few tries didn't provide the answer, but they did convince the men working on it that they were on the right track. Finally, about two years ago, they produced a belt-type cleaner. Several were manufactured and placed on dairy farms. They were used day after day, under actual working conditions. Week after week G.L.F. men visited each farm to see them in operation and talk with the farmer. It was clear that the belt principle was practical. All that remained was to get the "bugs" out of the cleaner, something that has to be done with every new machine. That development stage has gone on for two years and now the G.L.F. Stable Cleaner is ready—farmer-tested, proved in actual operation.

There are many reasons why men who have used a G.L.F. Stable Cleaner are quick in recommending it to neighbors:

## Simple Installation

One of the first things a farmer will tell you about the G.L.F. Cleaner is: "It's so easy to install. You don't have to remodel your barn or tear your stable apart." And that's true. A small amount of concrete work that anyone can do makes your barn ready for the installation. The

cleaner itself comes assembled, ready to use!

## Low Cost

Simple design *keeps original cost down*. Full, positive power keeps *operating costs down* to less than a cent a day in the average barn. Rugged construction keeps *maintenance costs down*.

The especially fabricated belt resists acids and abrasive wear. It is the only thing in the gutter and has been proved by four years' service in gutter use.

The chute to deliver manure to your spreader is of special steel that has twice the strength and six times the corrosion resistance of ordinary steel.

The heavy duty motor takes a heavy starting load with ease. The motor and speed reducer are direct-coupled for positive power even when exposed to the weather.

## Simple Operation

Operation of the G.L.F. Stable Cleaner is in a straight line along your gutters. There are no turns or twists to cause plugging—and, because there's nothing in the gutter but a flat belt, hand cleaning is no headache in the event of power failure.

## Two Models

You'll need Model 500 if your spreader box will be above the gutter level. This unit rolls easily on wheels to serve two or more gutters and can be wheeled out of the way when a clear barnyard is needed.

Model 300 is for use where the spreader box is at or below the gutter level.

The G.L.F. Stable Cleaner will soon be available through G.L.F. Service Agencies. Ask about it. Particularly if you're planning a new barn or changes in your present one, plan on the G.L.F. Stable Cleaner as part of the basic equipment.

Cooperative G.L.F. Exchange, Inc., Ithaca, N.Y.

## DUTCHESS COUNTY DAIRYMAN

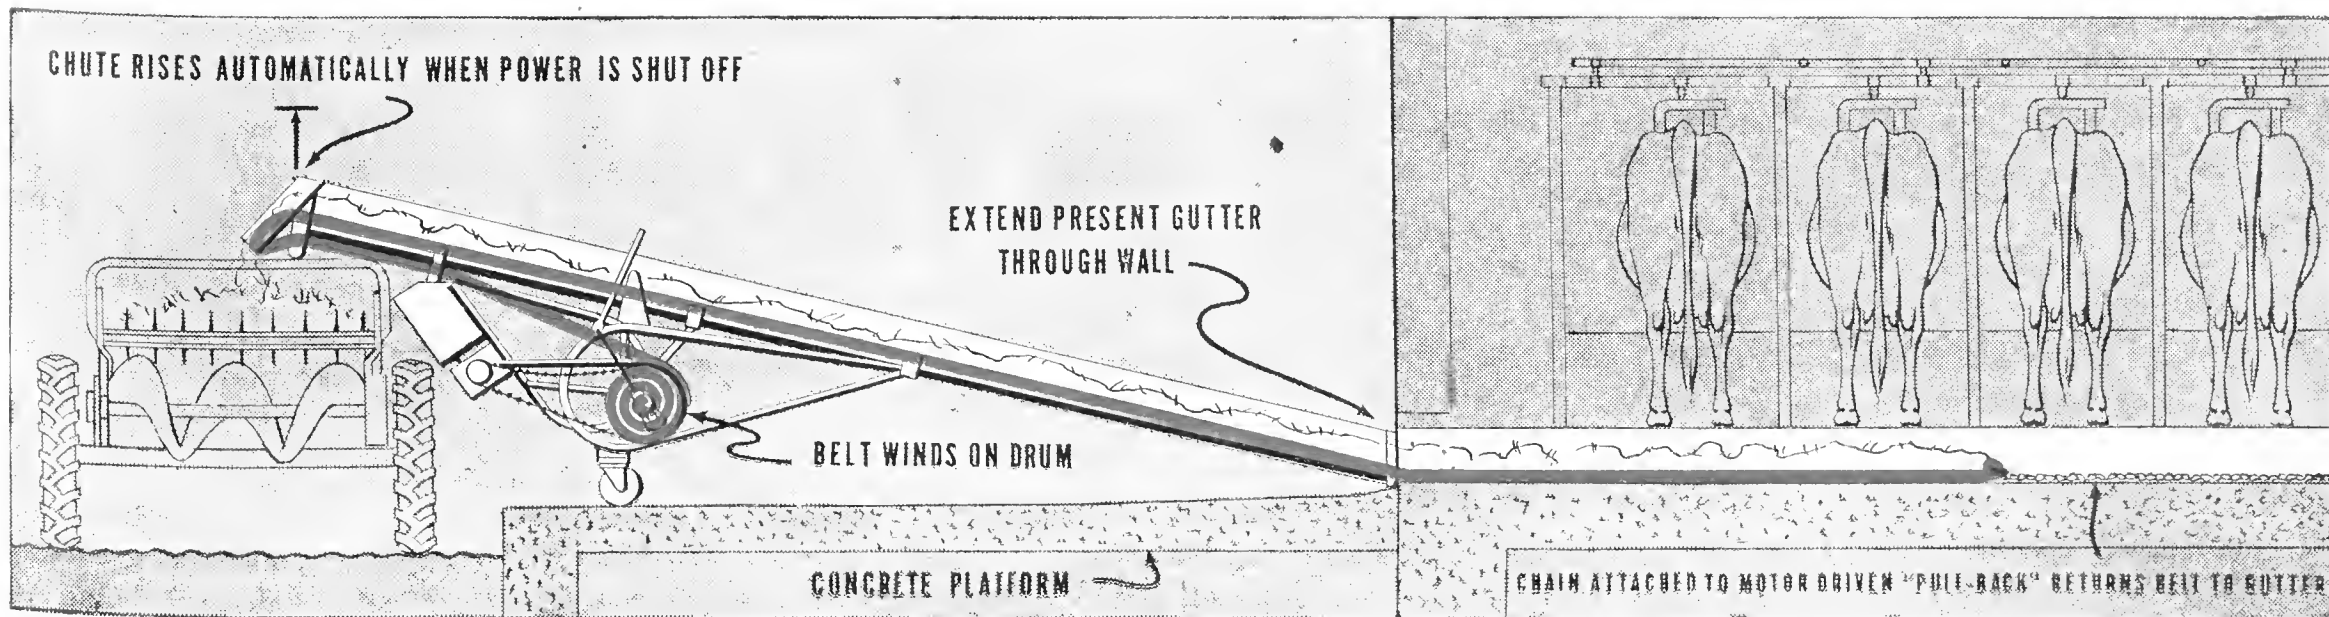

The stable on Cliff Baright's Vale Pond farm has two rows of cows facing in. Narrow alleys allow only about 3 feet between the gutter and the barn wall. For 22 long years they cleaned out the two alleys (one 78 feet, the other 64 feet long) with a shovel and wheelbarrow.

"Now, with my G.L.F. Cleaner, we save 45 minutes a day when the cattle are in all day and about 10 minutes a day when they are out on pasture," Cliff declares. "But even better than that, we are not all tired out early in the day. I wouldn't take anything for my G.L.F. Cleaner if I couldn't buy another. It saves us the dirtiest job on the farm and you don't have to work your heart out like you do with a shovel and wheelbarrow."

## Question Box

I am considering growing sudan grass for hay. How does this compare with millet?

Sudan grass can be used for either hay or silage. For feeding value and palatability it is about equal to millet which you state you have used before. You may also handle it as you would millet, using a binder and set it up in the field to cure. However, I believe that I would cut it early—that is, about the time that heads begin to shoot. If you do this you may get two cuttings from it. I would suggest around 25-30 pounds of seed to the acre.

If you do grow sudan grass, I believe I would avoid feeding it while it is curing. There is a possibility that its prussic acid content is somewhat higher in this stage than after it is thoroughly cured out.

Another alternative you might consider is to grow one of the taller varieties of oats for hay. Oat hay in my estimation is superior to either sudan or millet, although the tonnage would not be as great. For hay purposes I believe I would use Ajax oats.

You also ask if it would be profitable to use fertilizer for sudan grass or millet on land that has been manured. I believe that it will. The College recommendation for sudan grass is 150-400 pounds of 10-10-10 to the acre depending on the amount of manure. 10-10-10 is the grade you may not be able to obtain. In such a case I would suggest 5-10-10 or 6-12-6.—G. H. Serviss.

In setting out trees for reforestation, how many will it take per acre if we set them out 6 feet apart?

1,210 trees.

I wonder if the advantages I have heard claimed about disc plows are so? How do they compare in maintenance cost with moldboard plows?

Disc plows work best in soils so dry and hard that moldboard plows penetrate with difficulty, and in sticky soils where moldboards do not scour. They can also be used in loose soils where there are many roots, shrubs and bushes and they are common in northern New York where there is only a few inches of soil down to ledge rock.

If the land is loose and trashy on top, these plows do not turn the trash under but merely cut it up. In general they have already become popular in this state in instances where moldboard plows are used with difficulty. However, there are men who prefer them to moldboard plows for all types of soil. So far as I know, the draft for any particular depth of plow is about the same regardless of the type of plow.

—Paul R. Hoff

# A Visit With the Editor

By E. R. EASTMAN

THE chestnuts on the editorial page about the old-time railroads have brought in so many good ones that I don't have room enough on the editorial page to pass them on to you. In fact, I shall still have to leave out many good ones to get them into this space. See how many of these you have heard before:

Do you remember the old gag about Mike Finnegan, the section boss, who wrote such long reports of accidents on his section that the superintendent ordered him to shorten them up. Mike did. There was a bad wreck on the section and after it was over Mike reported:

"Off again! On again! Gone again! Finnegan."

Arthur Cook of Cineinnatus, N. Y., sponsors the following ones:

"Let's see," said one drummer to another, "when was this railroad built?"

"It wasn't built," the other answered. "It was created."

"How is that? What do you mean?"

"Well, don't the Bible say that God created all creeping things?"

Someone asked Jack Wray, old-time conductor:

"Which end do we get off when we get to Cincinnatus?"

Jack answered, shortly, as conductors have a way of doing:

"Take your choice. Both ends stop!"

Some called another slow train the "Tri-weekly." It went over one week, and tried to get back the next!

Mr. Cook concludes his letter by saying:

"As the Chinaman said when he saw a bear following him: 'If you likee my tracks, me makee some more.'"

Mrs. Lettie M. Tucker of Lancaster, New Hampshire, tells a story of a railroad in her state with trains so slow that a man who wanted to commit suicide laid down on the track and finally died of starvation!

Mrs. Arthur Edwards of Bridgehampton, L. I., tells of a conductor who got so very, very tired of listening to the complaints of a little old lady that he finally snapped:

"Lady, if you don't like this train, why don't you get out and walk?"

"I would, conductor," the old lady snapped back, "but my people aren't expecting me until the train arrives."

Gertrude I. Barrows of Oxford, Maine, tells a story about a train that usually just about shook the gizzards out of its passengers because of the rough roadbed. One day a passenger noticed how smoothly the train was riding and got up to look out of the window. He found that the train had left the tracks and was running along in the nearby pasture.

Mr. W. D. Fineh of South Norwalk, Connecticut and Henry Sherwood, Master of the New York State Grange, tell the story of a traveling salesman who found himself in a little country town where there was only one train a day. Finishing his business, the salesman carried his bags to the depot, then suddenly remembered that he had forgotten a purchase. He said to the ticket agent:

"Do I have time to go back to the store before today's train?"

"Yep!"

Whereupon the salesman hurried

away to the store. Coming back he rounded the corner just in time to see the tail end of a train disappearing from view. He ran up to the agent, mad as hops.

"Hey!" he shouted. "I thought you said I'd have time to go back to the store before today's train."

"You have," replied the agent. "That's yistiddy's train!"

Charles J. Spiker of Branchport, New York, says that once upon a time there was a train crawling through Arkansas, and after a time the conductor came along. An old man with a long beard handed him a half fare ticket.

"Wait a minute," objected the conductor. "You can't ride on this."

"Well, that's the ticket they sold me."

"Where did you get on, anyway?" asked the conductor.

"Back at the last stop."

"Why, no one got on there but a 12-year old boy!"

"Yep, I know. That was me!"

C. D. Hall of Loekport, New York, tells a true story of the early days in railroading when a train had killed a cow and the railroad refused to pay any damages on the grounds that the cow was on their property. The family rendered the tallow from the dead cow and greased the tracks so the engine couldn't make the grade, and, finally, to stop the nuisance the railroad paid the damages.

A lot of stories similar to this one were sent in:

"When the train came to the curve we all got off and picked blackberries, and then walked over the hill and met the train when it came around the other end of the curve."

Mr. A. Chubb of Randolph, New York, says that when he was a kid there was a one-legged man on crutches standing on the road that crossed the railroad tracks. The train stopped and the engineer asked the man if he wanted to ride. The man said:

"No, thank you. I'm in a hurry."

Mrs. Charles A. Libby of South Windham, Maine, tells one about Pat, who said to his friend Mike:

"I shure got ahead of the old corporation this toime; I bought a return ticket and I ain't comin' back."

Jay F. Hammond of Cortland, New York, writes that the following is a true incident that happened to one of the best engineers the Lehigh Valley ever had on the old E. C. and N. Division.

"While on jury duty a few years back, I was highly amused by an answer given the prosecuting attorney during his examination of an engineer who had seen long service on a railroad operating through our country, and who had had his share of unfortunate accidents. In this case his engine had hit and killed three or four cows that had strayed onto the track. The attorney asked him if it were not a fact that he had killed quite a number of cows during his term of service. The engineer looked at him a minute and replied:

"I never went out into the fields after them, sir."

Well, so they go. Old stories like these about the railroads are part of our folklore and are worth saving. I'm sorry I can't use all that were sent to me, but many thanks to everyone of you just the same.

# SELL HER MILK!

## Her calf doesn't need it ...with **KAFF-A**

**The safe replacement for milk!**

**Raise healthy calves on Kaff-A!** A million healthy heifers have already been raised on Kaff-A. It's the *safe* replacement of milk... the one you can be sure will produce healthy calves! So don't take a chance on an inferior imitation of Kaff-A. A nickel saved on feed may cost you many dollars if your cows turn out to be poor milkers because of lack of proper nutrition during their starting period. Be safe! Feed Kaff-A! Its vitamin content is known! Kaff-A has a nutritious dried buttermilk base. It also contains other dairy by-products, some cereal products, plus plenty of Vitamin A and D Feeding Oil!

**Every box gives you up to 500 extra pounds of milk to sell!** Just 1 lb. of Kaff-A replaces 10 lbs. of milk in calf feeding! That means every 50 lb. box of Kaff-A fed with low-cost hay and grain can release as much as 500 lbs. of milk you can sell! And you'll find that adds up to a handsome profit!

**Easy to feed!** Just mix one part Kaff-A to 9 parts of warm water, and begin to feed on the 4th day! By the 10th day your calves will be weaned! So feed Kaff-A and sell your cow's milk. Kaff-A is the safe replacement for milk!

# "Life Span" Nutrition

## A Practical Improvement in Animal and Poultry Feeding!

SINCE World War II, new discoveries in animal and poultry feeding have come tumbling out of research laboratories across the length and breadth of the land. They have come so rapidly—and are so diverse in character—that a state of confusion exists in the poultry and livestock business today. It's hard to digest so many new discoveries at one time.

These new discoveries will greatly effect nutrition. Many have already done so. But they are so complex and far reaching, that making practical use of them can best be left to scientific authorities.

Meanwhile, there is a very practical step that feeders can take to improve their feeding methods that will add hundreds of dollars to their earned profits.

One large Feed Company calls this practical improvement in feeding methods "Life Span" Nutrition, which is simply a matter of meeting the bird or animal's nutritional needs carefully and adequately every day across its entire life-cycle.

# Avoid Losses

Nature's laws are inflexible. Break Nature's law by failing to feed poultry or livestock adequately at any time during the life-cycle and then or at some later date the bird or animal's life will surely "spring-a-leak." Lost profits will gush out. Far more will be lost than could ever be saved on the feed bill. And the feeder will be the loser!

In a few simple words, that is the basic explanation of "Life-Span" Nutrition.

Take poultry. 10% of the chicks and 15% of the poults hatched will never live to see the 56th day.

The good poultrymen of America spend a great amount of time and money trying to find the breeder who has—through a lifetime of skillful breeding,—produced a chick with the inherited egg or meat-producing ability they want. But it is doubtful if one out of a 100 ever bothers to ask the hatcheryman how the breeding flock was fed. Yet research from many stations—in fact the research of all stations including the U.S.D.A. shows again and again that in many ways the feed fed the breeders determines the livability, growth and productivity of the offspring.

In 1951, the American farmer is going to lose 500 million dollars due to baby chick, baby poult, calf, pig and lamb mortality. Much of this loss could be avoided if the breeders were fed correctly during the prenatal period.

In 1951 something over 280 million pullets will be housed . . . and 1 out of every 4 of these pullets will fail to finish the first laying year.

# Died Too Young

If a 6-month old, ready-to-lay pullet is worth \$1.00—and she's worth more than that—\$70 million dollars worth of pullets will fail to finish their first laying year.

Here again is a period of tremendous mortality following a period of careless feeding.

Since growing pullets are producing no income, too many poultrymen feel they cannot afford to feed them. Others believe that birds big enough to be on range are big enough to shift for themselves. In any event, across the nation, growing pullets are more carelessly fed than birds are at any other time.

But you can't cheat Nature. You can't let down on the feeding job any time at all during the entire life-span or sooner or later life will "spring-a-leak" and dollars will be lost for every penny saved on the feed bill.

# BABCOCK'S HEALTHY CHICKS

## MAKE GREAT LAYERS

At the 1950 Storrs Conn. Egg Lavin. Test, our White Leghorns won first all breeds, with 3899 eggs and 4124.5 points. For the fourth time we won the high leghorn pen at the Georgia Test. Other 1950 records were good but not outstanding. In every test entered our Leghorns placed fifth or better. We still hold the all-time World's record, for all breeds, all tests won in 1944-45.

**WE HATCH THE YEAR 'ROUND**

White Leghorns, Red-Rock Cross, Rhode Island Reds and Barred Rocks. . . own two hatcheries with 600,000 egg capacity, three poultry farms and 15,000 breeders. We carry on a complete pedigree-progeny testing program.

# The Poultrymen's Question Box

By L. E. WEAVER

We were very much interested in the article of February 17 "Wet Litter in Poultry Houses." We have a large brooder house with a cement floor. The building is on high ground, has good drainage, and is filled in with gravel under the cement. It seems more of a case of the cement sweating in the cold months. The whole floor will be wet under the litter. We would like to know if you think the felt paper and another layer of cement would keep it dry as you spoke of in the article.

In the last paragraph of the short article about wet litter, it is pointed out that condensing of moisture from the air on the cold cement is a second cause of wet litter. In your letter you refer to the same thing, only you call it "sweating." Of course you have seen moisture appear on the outside of a pitcher of cold water on a hot and muggy day in summer. We say that the pitcher is sweating, but the moisture does not come through the glass. It merely condenses out of the humid air. The truth of the matter is that the wetness on the pitcher gets there because of two things. They are: (1) the surface of the pitcher is colder than the air around it; (2) the air is full of moisture (humidity). Under this set of conditions some of the moisture in the air always will change to water. In summer it will appear as "sweat" on the ice-water pitcher. In cold weather it appears as moisture on the cold cement floor of your poultry house, and then as wet litter.

No, I do not believe that it would help your situation at all to add felt paper and another layer of cement. I feel sure that with the high and dry location of your poultry house no moisture is coming up from below. All of it is coming from the damp air in the house. To remedy the situation you can do two things—I should say you *must* do them. Open up some windows, or better, install an exhaust fan and keep

it running night and day. That is to get the humid air out of the room and draw cooler, and therefore drier, air in. And secondly, keep that cement floor from getting so cold. Do this by covering it with mulch of fine litter material and dried droppings to a depth of at least 8 inches. In such a deep "built-up" covering a certain amount of "heating" will go on all the time, which will keep the cement from becoming cold and at the same time will drive most of the wetness out of the litter.

It is too late in the season now to start building up your litter. You had better depend mostly on opening your windows more for the rest of the season. Then get ready for next winter by starting in July to build up your built-up litter for next season.

After writing the above I have now noticed that you were talking about a brooder house. With heat from your brooding it should be easy to keep the litter dry. Just open the windows or ventilators and let the moist air escape.

I would like to install an automatic feeder in a 40 x 50 pen. Please let me know what the desirable and undesirable features are.

Automatic mash feeders are giving satisfactory service on many poultry plants. Their greatest disadvantage, I would say, is their cost. With a flock of less than 1,000 hens the savings in time and labor will not pay the cost of installing and operating the feeders. Hand feeding costs much less.

In your 40 x 50 pen you should not try to keep more than 700 Leghorns, less than that of heavy pullets. I doubt if you are justified in making the investment from the standpoint of economy. There may be other and good reasons for getting the equipment of course.

Aside from the above, the only undesirable features seem to be mechanical, and they are not frequent. The chain may wear holes in the feed trough if it is not properly leveled or lined up. Chickens may be caught in the chain at the corners. I suppose that the motor might play out, or timing mechanism fail.

What percentage of culling per week or month would be considered average in a laying flock?

In order to answer your question about the percentage of a poultry flock that would be culled per week or month under average conditions, I talked with Mr. F. E. Andrews in the Poultry Department at Cornell. He is about as good an authority as I know on the subject of culling. He says that your question can be answered only in a general way because no one knows what "average" conditions are. For example, if you are dressing chickens every week and delivering them on a route in town, you will cull closer and more often than the man who depends mostly on eggs for his income. But for what they may be worth here are the figures. For the entire year from 35 to 55 per cent of the original flock will be taken out. Most of the culling will be done in July, August and September, or in many cases, October. From October through the winter and spring up to June, only about 1 or 2 per cent will be culled each month. Then it is likely to run—June 5%, July 10%, August 15%, and September 10%.

Under the best management, however, where culling is closer, the monthly take-out will run to perhaps 3 or 4 per cent per month in some of the winter and spring months, with correspondingly fewer culled out in the late summer and fall.

## Danger of Disease

### Among Baby Chicks

Success in raising Baby Chicks depends largely upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby Chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your flock before you are aware. Use preventive methods—use Walko Tablets. For over forty years thousands of poultry raisers have depended upon them. You, too, can rely on Walko Tablets as a valuable antiseptic to aid in preventing the spread of disease through contaminated drinking water.

### Remarkable Results Raising Baby Chicks

Mrs. C. M. Bradshaw, Diagonal, Iowa, writes: "I have been using Walko Tablets for 35 years with splendid results. I would not think of trying to raise Baby Chicks without them. I also use them for my grown birds with the same satisfaction."

### You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Use them in the drinking water to aid in preventing the spread of disease through contaminated water. Satisfy yourself as have thousands of others who depend upon Walko Tablets year after year in raising their baby chicks. You buy Walko Tablets at our risk. We guarantee to refund your money promptly if you are not entirely satisfied with results. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer cannot supply you. Price 60c, \$1.20, \$2.50 and \$4.00.

Walker Remedy Co. Waterloo, Iowa

## YOUR COST OF GROWING PULLETS IS BEING DETERMINED

# NOW!

## THAT'S WHY "Life-Span" Nutrition IS SO IMPORTANT!

The influence of some feeds is so great, they pay for themselves many times over.

PRATTS CHICK STARTER is like that. It may cut your cost of growing pullets more than the Starter costs.

Research proves it can happen!

For example, in the recent British Columbia study, a good commercial Starter was enriched in just one critical nutrient. Growth was not improved. But, they got that growth on 11% less feed!

Here's another reason why the "Life-Span" Nutrition built into PRATTS CHICK STARTER is important.

Here is Starter so extra pure... extra wholesome... extra nutritious, it even

can head off many chick troubles that begin in the egg.

So the "Life-Span" Nutrition in PRATTS STARTER may pay for itself through increased feed efficiency alone. But, this great feed helps produce a LIFE-TIME of high profits in many other ways as well.

The high chick mortality your best future layers commonly suffer is retarded. Time required to reach maturity... attainment of full body size... intensity of first year production... all are favorably affected.

When only 2 pounds of a feed can help you do so much, why not insist on PRATTS CHICK STARTER?

The APF Factor—antibiotics—and all the other new discoveries are used in "Life-Span" Nutrition.

KEEP YOUR SUBSCRIPTION TO AMERICAN AGRICULTURIST RENEWED

By J. F. "Doc" ROBERTS

**M**ANY people are asking what the young, hopeful farm boy can do towards a start in farming under present costs of land, equipment and livestock.

Truthfully, there is little he can do alone to get established quickly under present conditions. So it becomes a matter of help and cooperation from us older people. There is much that we can do. Giving the young man a break could be and should be a part of every successful farmer's goal. With this help the smaller home farm can be saved, the farm community can be maintained, and our lands can continue to be farmed by farm families and not by a board of directors in New York or Boston.

With this cooperation, the good young farmer today is almost sure to be successful. There are so many factors in his favor that we older ones

### DRY GOODS AND CLOTHING

**Patchwork** pieces—flowered prints, tubfast, finest patterns and qualities. 7 lbs. \$2.25, x-tra large blocks 5 lbs. \$2.00. All postage extra. Community Textiles, 29 Radcliffe Ave., Providence, Rhode Island.

**VIRGINIA** peanuts: Raw, in shell, 6 pounds for \$2.00. Joy Acres, Windsor, Virginia.

**BLASTING:** 43 years experience, 30 tons dynamite used in 5 seasons. Ditching especially or walls under buildings, or blasting anywhere. Vernon Davis, Franklinville, New York. Tel. 78-J.

**ENVELOPES**, letterheads, 500-\$3.00, postpaid. Snell Printery, Red Lion, Pa.

did not have. Perhaps it would be well to mention a few of them.

### Machines Stop Drudgery

A great deal of the drudgery of farming has been removed by the use of machines. They have also made it possible for the young farmer's acreage to be increased, with the resulting higher income which is so vital today because expenses are so much greater. Machines make increased production possible on the same acreage; they are time-savers in getting the crops in and in harvesting them—which also assures less gamble with the weather and gives more time for livestock or other farm operations.

Our veterinarians have done a wonderful job in protecting our livestock, and thus have lessened the gamble and raised the returns to every farmer who raises livestock. When I started buying livestock for a big packer, the cow condemnations (unfit for human food, caused mostly by tuberculosis) ran 20% of all the cows bought. Today this condemnation is running about 1% from all causes.

When a buyer figured he would lose 20% of the cows he bought, he had to figure 20% off the price. Today all but approximately 1% are going back to the farm—a 19% gain to the farm. This amounts to millions and millions of dollars every year. Abortion (Bang's disease) is well under control. Mastitis, the greatest loss to farmers today, soon will be conquered by veterinarians, who, with State help, are now working on it so untiringly. I could mention a great many other advances in eliminating diseases in all species of animals which have lessened the gamble and returned millions more to farmers.

### Northeast Advantages

Population changes and increases, as well as transportation costs, favor the young farmer in the Northeast. Soil conservation, soil analysis, fertilizers, better seeds that make better grasses and better grains with increased production per acre, and faster methods of planting and harvesting, all increase the possibilities of successful farming.

Livestock improvement, greater production through better breeding, greater weight gains through better rations, with new demands and new uses for all animal products, will continue to bring in greater farm returns. The spread between meat animals and production animals seems to be narrowing every year, which again reduces the chances for farm losses in any type of livestock production.

The farming record of the last twenty years is one of tremendous gains. The young man has a greater opportunity and less chance of failure on the land than ever before. All he needs is that his father or uncle or neighbor or friend shall see and use the opportunity to assist a boy in need of a start in farming.

My mother fell fast asleep reading the newspaper in her favorite chair at her farm home, East Andover, N. H., February 21, 1951. Thus passed from us the spirit of the Wednesday evening prayer meeting, and her steadfast convictions: that YOU are your brother's keeper; that the dignity of any work lies in its accomplishment; that cleanliness of mind and body is next to Godliness; that to love thy neighbor is to live. May the poise, the graciousness, the sweetness, and the goodness of the farm women of her generation remain with us forever and ever.

—A.A.—

### UGLY BULL

While inspecting his stock Dr. Adolph Honese of East Benton, Pa., was attacked by his herd bull. The bull pushed him down and rolled him several rods to an electric fence where he abandoned the attack. The doctor spent several weeks in the hospital.

Don't wait—order now  
your Harder Silo  
to insure delivery

Yes, sir—this is the year you can't afford to wait and wait to order your HARDER SILO. Already there's a scarcity of many materials. So order now and avoid delay in delivery.

Installment terms and cash discount plans are available.

Write today for your copy of the very complete and informative pictorial booklet on the Harder Concrete Slave Silo or Harder Wood Slave Silo.

HARDER SILO CO., Box A, Cobleskill, N. Y.

### Jefferson Co., N. Y. AUCTION

SATURDAY, APRIL 28

67 Registered Brown Swiss Cattle

ROBERT D. BURNUP selling a choice offering from his well-known herd at his farm 2 miles west of BLACK RIVER, N. Y., just off Route 3 and 4 miles north of Watertown.

T. B. Accredited, Bang Certified, eligible for any state, mostly calfhood vaccinated.

Many fresh and close springers including 10 beautiful first calf heifers, others in all stages of lactation. A 481 lb. fat cow with 11,290 lb. milk in 321 days on 2 time milking sills.

## Sew for Summer!

By MABEL HEBEL

**T**HE sun-to-street costume, the suit-dress and the versatile shirt-waist—these are the big three in Spring - into - Summer fashions. And it's fabric and detail that contribute fashion spice. Silk is having a big revival in prints, shantung, surahs. Cotton turns up looking like tweed; like ribbed sateen, and as shadowy sheers. Casually speaking, the important sheers are the semi-sheers because they require no special slips: crisp tissue chambray, satin stripes, tissue plaids.

You'll see lots of linen, too: linen in eyelet embroidered versions; linen with trimming for texture contrast; pastel linens with navy or black as accents; linen with overprints for sharp effects. Best news of all, the wrinkle resistance idea is now a widespread development in this fabric.

The return to the fresh white look is giving prestige to pique. Starched white pique or linen collars and cuffs are in, vogue, best when they are very simple and can button on and off. Biggest collars come in white pique, with wide points bringing a feminine touch to an uncluttered dress. Self-trimming—a contrasting color or pattern in the same fabric—is stressed also. Eyelet embroidery either matches or con-

trasts with the background.

The horseshoe neck identifies dress No. 2340 as new. With its youthful fullness, it could be your choice for tissue plaid sheer, with starched white linen or pique collar and cuffs.

In No. 2128 the double duty idea is translated into little girl's sizes. The bare top dress and cover-up bolero, both scalloped, total an easily made ensemble that will serve from sun up to sun down.

Daughter will love princess sun dress No. 2395 with its very own bolero. It has extra appeal in panties and a flower applique which comes with the pattern.

Any young wardrobe will get an easy boost from pattern No. 2208—it makes two yoked dresses! One, belted, has cap sleeves and square neck; the other has puff sleeves and collar. Panties, too.

Simple strategy lends the wrapped look to dress No. 2314—side slanted buttoning which ends in a soft skirt pleat. Make it in a casual seersucker, and in a dressier fabric, too.

The well-dressed woman will include at least one double duty ensemble in her wardrobe. Simple, slim midriff sundress No. 2364 is good in day or datetime fabrics

(Continued on Page 26)

Great news from Procter & Gamble for every woman who washes clothes

# No matter what soap you're now using, **cheer**<sup>®</sup> guarantees you a cleaner, whiter wash!

**You're probably using** a perfectly good soap now. But because new CHEER is, beyond question, an important improvement in washing products, you owe it to yourself to try new CHEER—at least once.

And the very first time you *do* use it, you'll see, at every washing step, how new CHEER works to give you a cleaner, whiter wash than *any* soap you ever knew.

Next washday, you be the judge!

**1. Prove Cheer's Guarantee—IN YOUR WASHING MACHINE!**

New CHEER is the grandest help a woman ever had to do her wash. Thick, long-lasting suds spring up in a flash . . . work to remove not only toughest, greasiest dirt, but *also* the dulling film left on clothes by soap-washings! No water softeners needed!

**2. Prove Cheer's Guarantee—ON YOUR WASHLINE!**

You'll rinse and wring out a wash so clean and white it fairly *shimmers* on the line. Clothes dry so soft and fluffy, so fresh and sweet smelling, you'll want to *hug* them! And new CHEER is safe for colored washables, kind to hands.

**3. Prove Cheer's Guarantee—ON YOUR IRONING BOARD!**

Your clothes iron beautifully—gleam white and bright. CHEER leaves no film to yellow under the iron's heat! Your clothes are cleaner, whiter than *any* soap will get them! CHEER guarantees it—or your money back!

**SAVE SHOPPING TIME!** Get CHEER in the Giant Economy-size package.

Try Cheer once...and you'll Cheer forever!

**P.S. Wonderful for  
NO-RINSE WASHING, too!**

If you wash without rinsing, no washing product on earth can give you a cleaner wash than CHEER. CHEER will give you the cleanest no-rinse wash that it's *possible* to get.

**cheer**

PROCTER & GAMBLE

"Clothes dry so fresh  
and sweet smelling  
you'll want to hug them!"

## Your DOG TOO... Served by your BEACON DEALER

Your Beacon dealer—who supplies your dairy or poultry feeds—also carries a complete line of BEACON DOG FOODS. These foods include a ration for each stage of the dog's life cycle. Like all Beacon Products—Beacon Dog Foods are the result of painstaking research and careful tests. Give your dog the benefits of these fine foods.

## Sew for Summer

(Continued from Page 24)

—and the quickly donned bolero qualifies it for street wear.

No. 2374 is not just an ordinary, easy-to-make washable, but one that is flattering as well — the trick's in its princess lines! Note the new edition of the squared neck.

Because of its uncluttered cap sleeve lines, useful shirtwaist dress No. 2331 is both cool and comfortable. Try pique or striped cotton shirting, or a dressier sheer.

One of the best of all soft cap sleeve dresses is No. 2293. Tucks bring an easy blouse to the bodice; scallops add feminine accent. This is the style that is so nice to have all through summer in an airy sheer.

No. 2408 is the important suit-dress idea, simply stated with a feminized nipped-in waist. It's cool for the country in printed cotton, and trim for town in a collared shantung version.

The buttoned shoulder dress is a warm-weather basic because it's so easy to iron. Basque beauty No. 2362 features scoop neck and big pockets as style points.

Pocket sundress and button-on cape No. 2161 emerge as a new summer interpretation of the ensemble. You'll like its tailored look—and the fact that it comes in such a wide range of sizes!

### PATTERN SIZES AND REQUIREMENTS

No. 2128—6-14; size 8 dress and bolero, 3 yds. 35-in.

No. 2161—12-20; 36-46; size 18 dress and cape, 3 3/4 yds. 35-in.

No. 2208—6 mos., 1, 2, 3 and 4; size 2, cap sleeve dress with panties, 2 1/4 yds. 35-in., 1 1/2 yds. edging. Puff sleeve dress, 1 1/4 yds. 35-in. Separate panties, 3/8 yd. 35-in. Embroidery included.

No. 2293—12-20; 36-48; size 18, 3 1/2 yds. 39-in.

No. 2314—12-20; 36-42; size 18, 3 3/4 yds. 39-inch or 4 1/4 yds. 35-in.; edging, 3 3/8 yds.

No. 2331—12-20; 36-48; size 18, 4 1/4 yds. 35-in. or 4 yds. 39-in.

No. 2340—9-17; size 13, 3 1/4 yds. 35-in. or 3 yds. 39-in. with 3/8 yd. 35-in. contrast.

No. 2362—12-20; 36-42; size 18, 5 yds. 35-in. with 2 3/4 yds. trim.

No. 2364—9-17; size 13, 4 1/4 yds. 35-in.

No. 2374—12-20; 36-44; size 18, 4 1/2 yds. 35-in. with 1 1/2 yds. trim.

No. 2395—2-8; size 4 dress and bolero 1 1/2 yds. 35-in., 4 1/4 yds. ric rac. Panties 3/4 yd. 35-in. Transfer included.

No. 2408—10-20; 36-40; size 16, 4 yds. 35-in. with sweetheart neck; 3 3/8 yds. 39-in. or 4 1/2 yds. 35-in. with collar and cuffs.

**TO ORDER:** Write name, address, pattern size and number clearly. Enclose 25 cents for each pattern wanted. Add 25 cents for our new Spring-Summer Fashion Book which has attractive pattern designs for all ages, sizes and occasions. Send to AMERICAN AGRICULTURIST PATTERN SERVICE, Box 42, Station O, New York 11, N. Y.

The need for different working heights for different people and different tasks is demonstrated by three graduate students in a Cornell home management class.

## The Long and Short of It

IF YOU WANT to save your energy and avoid backache, watch your working heights, says Mrs. Dorothy Cousens of the New York State College of Home Economics, Cornell University.

There aren't any hard and fast rules about correct heights for ironing, mixing, using a rolling pin, and other kitchen tasks, because each of those activities requires a different height—and each of us is built differently. But here is a general rule which Mrs. Cousens gives her classes in home management:

If, as you work, your back is straight and your shoulders square, then the height of your working surface is correct for the job.

If you're getting a new kitchen, have it built to fit you, says Mrs. Cousens. But if, like the most of us, you must struggle along with the tables and work shelves you already have, she suggests these "dodges" for adjusting heights:

1. If you are tall, put wooden blocks

under a table to raise it to a convenient height for such tasks as cutting up vegetables or rolling out dough. Conversely, if you are a short woman, saw off an inch or two of the table legs.

2. Turn one of your under-the-counter storage drawers upside down as a pull-out shelf on which to beat eggs or stir cake, activities for which your table or counter may be too high.

3. Make a little rack for your dishpan if when it sits in the sink you must arch over to wash dishes.

4. Since the height for rolling pastry is 2 or 3 inches higher than the best height for mixing and stirring, try blocking up the breadboard on top of the work table.

Finally, Mrs. Cousens advises, "Experiment a bit. Go through the motions of washing dishes, mixing, ironing, kneading bread and the like—until you find the height that suits you best."

Will Rogers once said, "Nothing I have ever seen is more beautiful than this Inland Passage to Alaska." It is unforgettable, an experience to be treasured.

## Alaska Summer Tour Aug. 1-26

FOUR weeks of the happiest, most wonderful vacation imaginable is in store for those who take our Alaska Tour this summer—Aug. 1 to 26. Three days at marvelous Yellowstone Park; a visit to Paradise Inn on the slopes of majestic Mt. Rainier; a ten-day cruise on the calm waters of the scenic Inland Passage to Alaska; calls at seven Alaskan ports; three days in the beautiful Canadian Rockies, at Chateau Lake Louise and the luxurious Banff Springs Hotel.

Escorted by our popular tour conductor, Verne BeDell, you'll have no

travel worries; no tips to pay; no baggage to carry; nothing to do but enjoy yourself. The "all-expense" ticket includes everything and is extremely reasonable.

If you are thinking of taking this trip of a lifetime, send today for the itinerary. We are very sorry that there has been a delay in mailing it to the hundreds of persons who have already written us for it. We will fill all requests just as soon as possible. In the meantime, a deposit of \$25.00 will hold a reservation. Write to AMERICAN AGRICULTURIST, Box 367-T, Ithaca, N. Y.

## d-con will help you WIN the WAR ON RATS

**GUARANTEED TO CLEAR YOUR PLACE OF RATS AND MICE COMPLETELY OR YOUR MONEY BACK . . . . .**

Now, with amazing ease, you can clear your place of these disease carrying, property destroying rodents—and keep it clear, thanks to D-CON and its wonder working active ingredient WARFARIN. This scientifically developed product, discovered by the University of Wisconsin, is recommended by Federal Departments, county agents and the Farm Press of America. Its miracle, result producing action has been proven again and again in hundreds of supervised and controlled tests.

### SAFE, CLEAN, EASY TO HANDLE

D-CON is new, different. It outsmarts the rats because only cumulative doses prove deadly. Tests prove that rats return for successive daily feedings—they do not detect the source to avoid it—and a few days of feeding spell their doom.

### ENOUGH TO CLEAR YOUR PLACE OF RATS

Enough D-CON to clear the average farm of its entire rat population will be sent you in a plain wrapper with an ironclad money-back guarantee, for only **\$2.98**

**RUSH YOUR ORDER TODAY  
UNITED ENTERPRISES**

531 W. WEBSTER AVE. • CHICAGO 14, ILLINOIS

### RESULTS ARE GUARANTEED

Rats are smart—they have survived all efforts to destroy them. Now with miracle working D-CON, their days are numbered. D-CON will clear your place of rats in 15 days—or it won't cost you a penny. By following the simple feeding instructions, your troubles with rats and mice are over—now and forever.

### HANDY MAIL ORDER COUPON

**UNITED ENTERPRISES—Dept. AA-5**

## Pruning Comes First!

**D**URING the winter I had only to look out of the windows to be reminded of the pruning jobs which awaited the first warm days. When the leaves are off and all the faults show is the best time to lay plans for whipping the trees and shrubbery into proper shape. Here are some of the faults which greeted me and their remedies:

**Dwarf deutzia gracilis:** too many branches, many of them criss-crossed, ivy edging running rampant through them as well as through the yew foundation plantings. Remedies—cut off interfering branches, remove old dark canes, cut ivy back to edging proportions.

**Dwarf mock-orange (Avalanche):** too many small weak canes, some dead for half their length. Remedy—with lopping shears, thin out canes, cutting down near the base.

**Dwarf yew:** in good shape. I trimmed them for Christmas greens!

**Spirea van Houtte:** these are getting much too large, so out with the old dark stems right down to the base!

**Lilacs:** are getting tall and spindly; after flowering, crowded branches will be thinned. Normal cutting of flowering branches for bouquets helps.

**Viburnum carlesii,** also called May-flowering; its branching growth after leafing out tends to stifle circulation of air; hence, thinning by cutting off criss-cross branches, using some of them for flower arrangements, helps to correct this fault.

**Tartarian honeysuckle:** too tall and spreading; saw old dark stems just above the roots. This leaves some large spaces, but they fill in during the season. Have to use judgment about how many to take out at a time.

**Katsura tree,** sometimes called the caramel tree, due to its odor when leaves are mature; branches too near the ground interfere with the driveway and neighboring field. These must be sawed off; also, the many suckers that angle in all directions.

**Paul's Scarlet Hawthorne:** suckers on main trunk and on branches, particularly in crotches; many criss-crossed

branches. Remedy—remove all suckers and branches that go in wrong direction (and I'd better be careful while I do it, or I'll be well scratched!).

**Chinese elm:** twisted branch resulting from ice storm; too many small branches that hold snow or break off in the wind. These will be stream-lined a bit so that there is less damage when they are full of leaves.

**Dogwood,** the native and the Chinese forms: low branches interfere with mowing, and there are lots of criss-cross branches. Get 'em off!

**Flowering Cherry (Korolkowi):** this one has the strangest growth habits of them all, with secondary branches shooting off at all kinds of angles. Heavy lopping shears will get rid of those offenders.

**Apples:** grown for flowers rather than fruit and having the usual tendency to grow too big and to have too many suckers. Cut back to livable proportions and off with the suckers!

**Forsythia hedge:** much too tall and matted with criss-cross branches due to being skipped at pruning time. Now we have to cut out the old dark stems, trim others back to about breast high and remove the interfering branches.

**Privet hedges:** they were pruned late last season and can wait until new growth starts this year.

As is our usual practice, we'll start with the worst ones first; then if any have to be skipped they won't be hopeless next year—we hope!

—A.A.—

## AKIN TO EARTH

By Edith Shaw Butler

I wish that every child might know  
Where flowers blossom in the Spring;  
Might run and shout where small brooks  
flow,  
Might climb a slender birch to swing.  
Oh, surely every child should lie  
And dream a bit in meadow grass,  
Hearing a plover's clear shrill cry,  
Watching the fleecy white clouds pass  
Across the sky a Summer day;  
Children should pick wild berries sweet,  
Should watch a squirrel frisk and play,  
Should walk the land with brown bare  
feet,  
Joyous, eager by right of birth;  
Should grow akin to solid earth.

## A DESSERT TREAT

By ANNA P. WILLMAN

**E**VERY FAMILY has its favorite desserts, and one of ours is Spanish Cream. We never get tired of it because it is so easy to vary the flavor. The basic recipe below, with variations (all of them delicious), is a handy one to have on file:

### SPANISH CREAM

(Serves 6)

	Plain	Macaroon	Caramel	Chocolate
Gelatin	1 tablespoon	1 tablespoon	1 tablespoon	1 tablespoon
Cold milk	1/2 cup	1/2 cup	1/2 cup	1/2 cup
Scalded milk	2 1/2 cups	2 cups	2 cups	2 1/2 cups
Egg yolks	3	3	3	3
Sugar	1/2 cup (scant)	1/4 cup	1/2 cup	1/2 cup
Salt	1/4 teaspoon	1/4 teaspoon	1/4 teaspoon	1/4 teaspoon
Vanilla	1 teaspoon			1 teaspoon
Egg whites	3	3	3	3
Macaroon crumbs		2/3 cup		
Chocolate				1 ounce

Soak the gelatin in the cold milk for five minutes. Add to the scalded milk and stir until the gelatin is dissolved. Beat together the egg yolks and the sugar. (For Caramel Cream, caramelize the sugar and let it dissolve in the milk.)

Pour the hot milk slowly over the egg yolks, stirring well. Cook over low heat, or in a double boiler, stirring constantly, until the mixture coats the spoon. Remove from the heat and add the salt and flavoring. Beat the egg whites until stiff. Pour the custard mixture over the egg whites, stirring until well combined. Mold and chill. Serve with plain cream, fresh or frozen fruit.

Prepared by this method, the dessert will form into layers, a jelly on the bottom and a custard on top. If it is desired that the dessert does not form into layers, cool the custard, beating occasionally as it cools. Add the beaten egg whites as it begins to set. Mold and chill.

Enthusiastic about results she gets with New Dry Yeast

## Trenton Woman Prize-Winning Cook at 1950 New Jersey State Fair

**Mrs. John T. Heal** (right) shows the latest ribbons she has won, to her daughter Miriam. Mrs. Heal took four different prizes in cooking competitions at the 1950 New Jersey State Fair... a record which certainly makes her one of this section's leading cooks.

Cooking expert Mrs. Heal joins so many of her fellow prize winners in recommending Fleischmann's New Improved Active Dry Yeast. "It's the speediest acting yeast I've ever tried," she says. "I find it easier

to use, too. This New Dry Yeast gives me splendid results every time."

It's true! Yeast-raised treats are delicious and nourishing. Nothing can top their rich flavor—nothing makes more of a hit with the menfolk. When you bake at home—use yeast—Fleischmann's New Improved Active Dry Yeast. It's the best ever... easier to use, faster dissolving. Buy a supply soon—when you bake at home, delight your family with yeast-raised goodies.

## If Ruptured Try This Out

Modern Protection Provides Great Comfort and Holding Security

Without Torturous Truss Wearing

An "eye-opening" revelation in sensible and comfortable reducible rupture protection may be yours for the asking, without cost or obligation. Simply send name and address to William S. Rice, Inc., Dept. 65-M1, Adams, N. Y., and full details of the new and different Rice Method will be sent you Free. Without hard flesh-gouging pads or tormenting pressure, here's a Support that has brought joy and comfort to thousands—by releasing them from Trusses with springs and straps that bind and cut. Designed to securely hold a rupture up and in where it belongs and yet give freedom of body and genuine comfort. For full information—write today!

## WHAT'S GONE BEFORE

Immediately after his marriage to Ann Clinton, Mark Wilson leaves to join Lincoln's volunteers. He is followed into the army by his brother, Charlie, his father, George Wilson, and by Ann's father, Fred Clinton. Word comes from George Wilson that Mark has become involved with the entry into the Union lines of a Southern spy, and has been court-martialled. George has been refused a furlough, but Nancy and Ann make the long hard trip to Washington, succeed in seeing President Lincoln, and obtain a pardon for Mark. When they leave the President's office, Nancy courageously approaches Secretary of War Stanton with the request that after the long trip to Washington she and Ann may be permitted to see their men. Adamant at first, the Secretary finally agrees to see what he can do, and after three anxious days, the men arrive at the hotel where Nancy and Ann are staying.

## CHAPTER XVI (Continued)

**N**EXT morning when they were all together, the talk was about a new government order abolishing all regimental bands in the volunteer service, except one for each brigade at headquarters.

George explained to Nancy and Ann that at the beginning of the war no regiment was thought complete unless it had a full brass band, some of them containing as many as fifty pieces. With four or five regiments in each brigade, three brigades in one division, and three divisions in each corps, that made a total of from thirty-six to forty bands in every army corps.

"How wonderful!" exclaimed Ann, enthusiastically. "What a lot it must mean to lonesome, homesick boys to see and hear all of those bands playing together."

"Not any more," said George, "now that the government has suddenly decided that so many bands are too costly. If most of them are disbanded the musicians will probably re-enlist as regular soldiers."

"I think it's mean to deprive the soldiers of their music," commented Nancy.

"Well," said Charlie, "that's one of your wonderful Secretary Stanton's ideas. He says the army needs less nonsense and more discipline, and apparently to him music is just nonsense. But I don't care what Stanton or any of the other army bosses think. When they take music out of the war, they knock out something that keeps men going when nothing else will. Let me tell you what happened just a short time ago, when we were marching to Sharpsburg to drive Lee out of Maryland."

George interrupted him.

"Won't that wait, Charlie? We haven't got much time for stories."

But Nancy said:

"Leave him be. You don't tell us much of what happens to you and the boys, and I want to know."

"Well," Charlie went on, eagerly, "you'd know what war's like if you'd seen the Army of Virginia, veterans of the Peninsula campaign, on that march. The men's hands and faces were burned almost black, thousands of them had no shoes, and they had to lug their cans, blankets, haversacks and canteens under that hot sun—except those who'd thrown 'em away be-

cause they couldn't carry 'em —, and themselves, too. You remember, Pa, how we stood on that knoll in the vanguard and looked back at that endless line? There they came, a brigade of infantry, then one of cavalry, then the big guns of the artillery, and last a wagon train of supplies. Often, the supply train was way behind and we didn't have anything to eat."

He paused for breath, and held by his earnestness, no one spoke.

"Those men were worn out and desperate, and the only thing that kept 'em going was the drums—the music of our bands! Every time we struck up a tune you could see their heads lift, their steps pick up, and their shoulders straighten as they tried to march in time to the music. And now Stanton wants to throw it all out!"

Somewhat embarrassed by his own vehemence, but determined to tell the truth at last about how he felt about Army life, Charlie smiled wryly, and said:

"Adventure! Who said there was adventure in war? It's hellish! Starvation, suffering, endless waiting, and finally injury and maybe death."

Nancy sat watching her son, saying nothing, but remembering how he had run away to enlist for the adventure of it. How sadly he had been disillusioned!

Charlie's tale had diverted George's thoughts from the need of making plans. He, too, began to reminisce.

"I'll never forget that awful march, either. I can still see that long column stretching away as far as one could see, like a gigantic snake, and the

hardbitten look on the faces of the veterans, and how their lagging steps picked up when we struck up the band. When we started to play "John Brown," the men began to sing and completely drowned us out with

John Brown's body lies a-moldering in the grave,

But his soul goes marching on.

"Somehow as I looked at those men, barefoot and ragged, but still singing along, stepping in time to the music, I knew that they might lose many battles, and that it might take a long time yet, but still they wouldn't lose the war. The Union was safe."

"Well, if there are no more bands," said Ann, "doesn't that mean that you can all come home?"

"Not so fast, young lady, not so fast," George smiled. "But it does mean that Charlie and Mark will receive an honorable discharge before very long."

Now Nancy was excited.

"What do you mean, George Wilson? What about you?"

George looked gravely at his wife, hesitated, then said:

"Well, as I told you a moment ago, one band is being retained for each brigade, and when some of the officers asked me to lead it, I couldn't very well refuse."

"Father did his job too well," said Charles, proudly. "He was the best musician in our band, and the officers knew it."

Nancy walked to the dirty hotel window and stood gazing out for a few moments. Then she said, sadly:

"Then you won't be coming home to us?"

"No," said George, gently, "but the boys will be home as soon as their discharges come through."

Ann, sitting close to Mark, reached for his hand. He held hers for a moment, then let it go and suddenly stood up, facing all of them.

"I am going home as soon as I get my discharge," he said, quietly. "But I'm coming back. I can never live with myself, nor with you, until I have wiped out what happened by proving to President Lincoln and Secretary Stanton—whether they know of it or not—and to you, Ann, and you, my folks, that I am a good soldier and that

I can do my duty. I shall re-enlist soon."

In spite of the ache in her heart and the lump in her throat, Ann felt a great pride swell in her breast for her young husband. Never, she thought, have I loved him so much.

"We understand, Mark," said Nancy, tenderly. Then she turned to look at Charles, realizing with a pang how rapidly war had matured him. When he had run away to enlist, it seemed to her that he was still just a little boy. But that could no longer be said. He, boy, who just yesterday was a baby, had grown into a man. Like his father and brother, he looked tired and careworn, and she knew that Mark's trouble and danger had left their mark on him, too. But now, as he sat there in his blue soldier's uniform, happy and relaxed, she was proud of him, too. Catching her glance, he grinned:

"Oh, I know what you're thinking, Ma. While we're at it, we might as well get my fate settled, too. Yes, I'm coming home all right."

Then the grin left his face and his mouth settled into a hard line as he continued:

"Even though war is hellish, I'll be back, too. I liked being in the band fine, but now that's out so I'm going to carry a gun." Then he qualified his statement, "Or let a horse carry it. I'm tired of walking, and if they'll take me, I'm goin' into the cavalry."

Nancy looked at her menfolks with mixed feelings. Everyone knew now that the war would be a long one, and no one could foresee the end. All one could do was to live a day at a time and try not to worry. But she couldn't help feeling that George and Mark and Charlie had made their plans without any consideration of the women's problems at home. She rose quickly from her chair and said to Ann, with spirit:

"Well, Ann, I guess that's that. Our men seem to have the decisions all made. We might as well be on our way."

Then, noting a hurt look on her husband's face she said, more gently:

"But maybe they are right."

## CHAPTER XVII

**A**LL during the long but happy trip back from Washington, Ann thought how different she had felt on their way down. Then every minute had been torture. At times she had found herself pushing hard with her foot on the floor of the coach as if to make the train go faster. There had been room in her mind for only one thought, one prayer, that God would help them to see the President and be in time.

Now her prayer had been answered. They had seen the President, they had been in time, Mark was safe and, glory be, he would be coming home soon. Even though it would be for only a short time, she would be with him. Now she could look out of the window and take some interest in the strange country that slid by so rapidly. She could be interested in the raw recruits who crowded the railroad stations on their way South. She could sympathize with the veterans, clad in faded and often ragged blue uniforms, some of them on furlough or maybe discharged from their first term of enlistment. She observed their tired young eyes above their long beards.

It interested her, too, to see the country gradually change from the bright green of the Maryland and the southern Pennsylvania countryside well supplied with rain, to the river and creek valleys and the wooded country of the Pennsylvania mountains, now showing autumn colors after the first frost of the fall. It began to look like home.

Even the stagecoach journey from Cwego to Jenkstown was interesting and, as they neared home, how good the familiar scenes looked to them! Nancy had been quiet during the trip.

## SLIM AND SPUD

## Ya Have to Own the Joint, Spud

## Farming with One Arm

(Continued from Page 1)

and let the wood do the holding.

When working with machinery, the plier wrench is the handiest tool I've run across. Clamped to the head of a bolt, it holds it from turning while I twist the nut. And it's dandy for holding pieces of metal in position for welding, or clamping work to a bench to keep it steady. And if the plier wrench won't work, there is always the bench vice or C clamps.

After I lost my arm, I thought I'd have to leave such jobs as picking berries to someone else. But I soon found, though I never realized it before, that here too you use one hand mostly for holding. My hook is just the ticket for pulling those briary long blackberry canes down where I can reach the fruit.

I'm sure I wouldn't know what to do without the hook. I am reminded of the time, before I had acquired it, when at an Army mess table, I tried to cut a steak one-handed. Try it sometime just for fun. I was debating whether I could best hold that skidding T bone down with my chin, my elbow or my foot, when a fellow amputee lent his remain-

ing hand and we co-operated.

But now the hook makes such things easy. With it I can hold a fork with such ease that my wife makes me carve the chicken for Sunday dinner. It is equally handy in guiding the north end of a pitchfork or carrying a pail of milk, and I can write with it if necessary.

As does any handicapped person, I have developed compensating skills for those farm jobs which require two hands. I haven't much luck in using an ax, mattock or post maul. So I just grab the handle a bit short with my remaining hand and bang away. As a result I've developed arm and shoulder muscles like a circus strong man.

Of necessity, my five remaining fingers have become so dextrous that often when there's a job of replacing a small nut or screw in a mean place, I'm elected to do it. I've learned to use a typewriter better with five fingers than I ever could with ten.

But it's with the jobs that require the full strength of back and two arms that I really go all out at labor-saving. If I can't lift, say, the cultivators into place on the tractor, I jack it up or suspend it from the ceiling of the machine shed with block and tackle. Such

tactics often pay off double, for if I can make a job easy for me, it's just that much easier for Dad, and it saves time to boot.

It's the power fork which we built in our own shop for about \$60 that makes me 9 feet tall and 4 feet across the shoulders where muscles are needed. With it I can clean the new pen stable with ease, load logs, move stone walls, load gravel, plow snow, jack up brooder houses and range shelters, and do a dozen and one other things. The hydraulic system, coupled to a remote cylinder, makes it unnecessary for me to use levers to control the pickup of the hay baler or set the corn planter into the ground.

I'm sure I'll never forget my one-armed return to farming. To me it's a fascinating business and the most satisfying life one can lead. Perhaps as I get older, doing things with one hand may become more difficult. But I doubt it. By then there will be new labor-saving devices to make things still easier.

Perhaps when I get to the "old timer" class, I'll mow the alfalfa with a radar push-button gadget from an easy chair on the front porch. But until then, one arm will do.

## NO DRUMS

(Continued from Opposite Page)

After all, George wasn't coming home, not in a long time. The boys would soon be coming back, but not to stay. Yes, it was good to be home, she thought, but was it really home with her husband and two of her boys still in constant danger? She looked over at Ann's happy face, alive with interest as she watched the passing scene, and Nancy breathed a silent prayer that happiness would be Ann's lot, or at least that there would be more happiness than sorrow for her. For herself she added a petition that the day would be hastened when peace would reign again.

There hadn't been time to let Enoch know they were coming, so no one met them at Jenkstown. They climbed off the stage, picked up some mail at John Crawford's store, answering briefly his eager questions, and set off on foot for home.

Nancy left Ann at her home and hastened on alone. Her depressed feeling didn't leave her until she opened the kitchen door and saw the incredulous joy that shone in the faces of her little girls. They had just finished supper, and, as Nancy stepped into the kitchen, Mary Curtis at one end of the table and Enoch Payne at the other jumped to their feet. The girls dashed madly across the room, threw themselves upon her and hung on as if they could never let her go again. She dropped her carpet bag to put her arms around them, and then stood, divided between laughter and tears, as they danced around the kitchen, occasionally stopping to give her another hug and kiss. Tom, who had appeared from the barn, stood grinning, wishing just as much as his sisters to show his mother how glad he was that she had returned, but, boylike, a little reticent about too much outward demonstration.

Minutes later, when the children had quieted down a little, Mary Curtis came to Nancy, put her arm around her shoulders and, a little shyly, gave her a gentle hug, while Enoch pumped her hand so long that he apparently forgot he had hold of it.

How wonderful, Nancy thought, to receive such a welcome. How could she ever be cross again with the children or forget to count her blessings when she thought of her problems? And how could she ever get along without the help and friendship of folks like Mary and Enoch!

Later that evening, after the chores at the barn were finished and the little girls had finally quieted down in bed,

Nancy, Mary, Enoch and Tom sat around the kitchen table with its gay checked tablecloth. A single flickering candle drove the shadows toward the walls and corners of the room as Nancy told all that had happened on their trip and answered their questions. There was so much to tell that the candle burned low before she finished.

In bed that night, her thoughts still racing, came the memory of what she had only subconsciously noticed while she was talking at the table—how in spite of their keen interest in her story, Mary and Enoch had looked at each other more than they had at her. She hoped those glances meant a growing understanding. If so, she thought, then our trip has had one more good result.

At the Clinton home the situation was different. Bursting with happiness and enthusiasm, Ann rushed into the house and greeted her mother with a hug and a kiss, almost shouting:

"He's coming home! Mark's coming home!"

Mrs. Clinton drew herself from Ann's embrace, and said:

"That's good."

But there was such a lack of enthusiasm in her tone that Ann looked sharply at her and said:

"Why, Mother, aren't you glad that Mark is out of trouble and is coming home?"

Mrs. Clinton sniffed, hesitated, then said:

"Things won't be very pleasant for him around here after the way he disgraced himself."

Ann was stunned.

"Disgraced! What do you mean? He made an honest mistake and the President of the United States pardoned him."

"Why did he get kicked out of the Army, then?"

"Kicked out! He didn't! He has an honorable discharge as a musician. He's coming home for a while and then he's going to re-enlist. How can you believe such things? Who's been talking to you?"

Her mother was indefinite.

"Oh, I hear things," she said vaguely.

Chilled, Ann changed the subject and asked about the farm and the stock. The report was discouraging.

"Oh, Enoch Payne has been doing the chores," said her mother, "but nothing else has been done."

"But, Mother, I haven't been gone long. The crops aren't suffering, and just as soon as Mark and Charles get here we'll clean up the fall work on both farms."

"Well," her mother said, rather grudgingly, "that will help out tempo-

rarily. But we're going to lose this war, and you and I are going to lose this farm, sure as preachin'. Then what'll we do?"

Struck by a sudden thought, Ann cried:

"Mother, that kind of talk sounds like Henry Bain. Has he been here since I've been gone?"

"Yes, he has," said her mother, defiantly, "and I don't know what I'd have done without him. One night when Enoch was off carousing to Ithaca, Henry went down and did the chores. And I don't care what you say, I'm beginning to think that he's right about this war. Look at it! Almost all the war news we get is bad news; we're defeated in almost every battle. Henry says the Confederates have better generals, and their soldiers are trained to fight better. It certainly looks that way. Henry says that we have no business fighting on southern soil. If the southern states want to be independent and to have slaves, why, let 'em. Why should we lose everything we have? He says, too, that England and other countries think the South is right and are going to interfere to stop the war."

Tired from the strain of the past several days, Ann's temper was out of control. She jumped to her feet and said, hotly:

"How can you talk that way? How can you listen to a coward who stays home and makes money while all of his neighbors are fighting for their country and we women are doing what we can to stand back of them? Don't talk to me about what Henry Bain says!"

A little frightened by Ann's vehemence, Mrs. Clinton tried to mollify her.

"Maybe you're right, Ann. Maybe you're right. I just don't know. But I'm so worried that we'll lose our home and have no place to go that I'm most out of my mind. And Henry Bain has been good to me. When I've been lonesome and worried, he has talked to me, and he's certainly right that the war is going against us."

Ann stood looking at her mother for a moment, and then said, gently:

"Well, I know you're worried, Mother. We all are. Let's get something to eat and we'll both feel better."

Too tired and excited to sleep that night, Ann lay in bed watching the big round harvest moon that threw a patch of light on her bedroom floor. She kept thinking of things her mother had said and recalled her remark about Enoch carousing in Ithaca. "Now, what did Mother mean by that," she wondered. "I never knew Enoch Payne to get drunk. I'll ask him myself."

(To be continued)

## SAVE That Silo!

Save money, too! If your present wood stave silo is out of shape, weakened, or even collapsed...

### REBUILD THE CRANELOX WAY

1. Good material in your present silo — for Economy.
2. Silafelt — for Insulation.
3. Crainelox spiral "wrap-around" — for Strength, added insulation and beauty.

Your Crainelox rebuilt silo will be stronger than ever, warmer than ever. And no more hoops to bother with.

### CRANE'S THE NAME

If building NEW, you can SAVE by using Crainelox with your own stave lumber. So, building or rebuilding, write for details.

## SUNNYGABLES NOTES

By John Babcock

**T**HERE has been a lot of talk about what is referred to as the shotgun wedding of the Production Marketing Administration and the Soil Conservation Service. As the two government agencies move into the same quarters for the sake of coordinating operations, it looks like PMA wears the pants in the family. I have even heard the claim that it was a clever step to place just one more service under Washington control.

A move toward gathering government agencies under one roof where they can easily be visited by farmers sounds good. In this case, though, there is no mention of economizing on the number of people on the total staff. They'll probably hire another janitor to care for the expanded office space.

The Soil Conservation Service has done some swell things for farmers. Yet, there is growing sentiment that government payments through PMA for conservation work is no longer needed. We still need guidance and help with soil conservation practices, but the small amount of money that is paid out by the government for liming and other practices could be cut out. I feel like such funds put farmers under some kind of moral debt to the ever increasing grip of the government. Also, it fosters in non farm people a feeling that Uncle Sam pays farmers for all they do. Lastly, every dollar we get from the government in this way costs two or three dollars in taxes.

I'm not excited about the question of soil subsidies. I just don't think they are worth the price we pay.

### CORN OR SMALL GRAINS?

**O**F the farmers in our valley, I think Boots Poelvoorde is probably the best crop farmer of the bunch. Although his first consideration is an adequate supply of good pasture and grass for silage or hay, he has consistently done a good job of raising both wheat and oats. He is fortunate enough to have a few extra acres for this purpose either on his own farm, or by rentals of nearby properties. Boots stays clear of corn, however.

### Work Spread Out

Boots feels he can raise more dollars per acre with less work by growing small grains. Wheat makes up his only real cash crop, and oats does a lot to whittle down winter feed bills. Both serve as nurse crops for new seedings.

True enough there are new corn varieties that mature within the short growing period we have in the Northeast, and breeding improvements have produced reliable, strong-stalked, high yielding grain corn varieties. Where you have cast your lot with early cut green forage, however, corn may not fit the scheme. Because of the time and labor required to grow corn, our ever-

decreasing supply of cheap farm labor is also a consideration.

The advantages of using wheat, oats and rye as home grown grain lie in how conveniently they fit the season's work. Wheat ground fitting and planting comes after the pressure of fall work is over. Oats go in early enough not to conflict with first cutting. And rather than double up our work load while grass silage is being put up by planting and cultivating corn, we have time to concentrate on putting up good ensilage. Combining comes after this work is done and before second cutting.

### Machinery another Factor

Boots and I have done a lot of scheming to use the machinery now on the farm as much as possible. Boots does own a combine. I think in the long run that he is money ahead to get as much use as possible out of the combine on home and custom work, rather than get involved in the new machinery he would need to handle corn efficiently—planter, tractor cultivator and probably a picker.

The straw from our small grains, plus that picked up from neighbors, makes up the heavy bedding requirements of the pen stable. There is nothing better than corn stover for bedding a pen, but again there is the labor problem of handling and shredding the stalks with yet another machinery operation.

### Keeping Corn or Grain

From figures I have seen in the Midwest, the actual nutrient losses in improperly stored corn are very high. This applies to corn that has been cribbed too damp, left on the stalk all winter in the field, or cribbed so that there is not enough ventilation. You have probably read about "soft corn" years in the West and the steps they have taken to develop crib driers or other methods of saving soft corn. With the humidity and short season we have around Ithaca, I am afraid even with our short season corns that we might get into trouble.

Lastly, we have never built suitable cribs or storage for corn at Sunnygables. On the other hand, we have room to store small grains, and a place to spread out grain that has been combined a little tough.

### Not Against Corn

I'm not making a case against corn in general for the Northeast. But in the same way many farms cannot be transformed overnight into model grassland farms, I don't feel that we are equipped either with machinery or the right kind of farming setup to include corn in our farm plans.

**EDITOR'S NOTE:** We, of course, agree with John that there are many farms in the Northeast where growing corn for grain is not practical. Every farmer will have to judge his own situation.

However, it is true, also, that there are many northeastern farms where small grains cannot be grown except at a loss.

The case for grain corn rests on the facts (1) that there is a cost of about \$30 a ton handling and freight charges on corn shipped into the Northeast from the Midwest; (2) that as John points out there are now hybrid corn varieties that will mature here and

This is as far as Martin Sinc got with his building plans last winter to replace his burned out barn with a modern building. The covered part of the basement is roofed and already houses the herd. Two other spacious rooms already have walls (foreground) and will be finished as the cows pay their way. The next move will be to complete the barn over the cows to cover baled hay and straw storage this summer. You will remember that I wrote about Martin's problem in two issues of A. A. last fall.

yield well, and (3) that I personally cannot see much hope for northeastern dairying unless we use *every* means, including grass silage, better pastures, more and better legumes, and more corn and other homegrown grains.

Otherwise, just as sure as night follows day, dairymen will be caught in the squeeze between the high costs of everything they have to buy and the constant pressure from consumers for low milk prices.

## Spring Plans

By Jack & Jean Conner

**A**S we write this—March 18—all of our spring work lies ahead of us. Here in the Inlet Valley, we usually plan to have our oats drilled in March. This year, there will have to be a lot of thawing and a lot of drying before any oats are drilled. However, our oat acre-

cows' grazing on small areas for short periods so that each lot will furnish lush pasture as it is used in rotation. With our movable irrigation systems, we should be able to speed up the recovery of these grazed-over areas quite rapidly. Also, we are planning to give this field 350 pounds of 0-19-19 to the acre to prepare it for the pasture season ahead.

### New Heifer Pasture

Jean and I have rented an adjoining farm to use as a heifer pasture. It will be mostly a native grass pasture, but will be sufficient to provide feed for the fifteen heifers we plan to run on it. There is a good basement barn on the farm to provide shelter from the weather and flies, and as a place for supplementary feeding if it should become necessary.

### Poultry Discontinued

Our poultry enterprise has been discontinued, at least for the present. Hens require a lot of fussin'. Monroe Babcock, one of the best poultrymen I know, says that most young men cannot get along with poultry because they will not fuss with the birds—it takes an older, quieter man to do a top-notch job with poultry. I am inclined to agree. With Spring work coming on, we have decided to close out our poultry operation and concentrate upon producing just as high quality roughage as we can for our dairy herd. By next fall our herd will be of such size that we will not have the necessary time and labor to devote to a poultry flock.

In the meantime, the space formerly occupied by the hens can be easily converted into heifer and calf pens and into storage for hay and grain.

### One-Man Farming

This winter we have operated with no hired hands, except for an occasional bit of day help. Caring for 16 cows, 25 head of young stock and 900 birds is quite a chore. All during the winter I have remembered something I heard my high school vo-ag teacher say: "One man farming may be all right, but did you ever hold a gate open and try to drive a cow through it?"

Jack Conner is the fellow who does the work at Sunnygables, so I asked him and his wife Jean to sit down and write up their Spring plans for Sunnygables. I think you'll agree that they make a good writing and farming team.

age will be low, only eight acres to be drilled and seeded to a brome-ladino mixture. This field lies some distance from the main part of the farm and is usually the last field in the haying operation. Also, it is practically inaccessible for livestock.

These two factors have led us to choose brome grass instead of orchard grass as we have in some of our other fields. We have found that our cows will eat brome grass cured at nearly any stage of maturity, whereas they stick up their noses at orchard grass which has become too old.

### Fencing High On List

Fences rank high on our list of spring work. We have learned that poor fences can be very nerve-wracking and time-consuming. We like the one-strand, knee-high electric fences that some farmers use with apparent safety to control their cows, even in pastures next to busy state highways. This type of fence would never work with our cows. They have become quite bold and seem to walk the fences and study them until they find a weak spot. We think they acquired this habit as heifers when running in—and out—of pastures with poor fences. This year we hope to rebuild their respect for barbed wire by working over every fence on the farm.

One new fencing angle we're going to try on our irrigated pastures this summer is to divide them into small lots. The idea is to concentrate the

# It's School Meeting Time

By HUGH COSLINE

**Y**OUR first step in reversing the trend toward centralized government with all its faults and dangers is to help make grass-roots democracy work right in your own neighborhood. Yes, and an excellent place to start is in your local school meeting which, in many New York State districts, is just around the corner on May 1.

"But," you may say, "the local district doesn't have any power. The State Education Department has gobbled it all up; they want to run everything."

The truth is, that parents and taxpayers have plenty of power if they will use it. If you doubt the statement, read editor Ed's article on page 1 of the last issue. As a matter of fact, the chief reason why state education departments have taken over some jobs that should be done locally, is that the voters have refused or neglected to assume their rightful responsibilities. Someone must do the job. If voters won't, some government agency will.

Others of you may say, "A few people always run the meeting anyway. They have a 'cut and dried' program and always seem to have the answer if anyone proposes a different action."

The answer to that one is to have some well-thought-out plans of your own, based on careful study of the facts. That takes time and effort which may be the reason why it is not done more often. But a school will not run itself; you can help run it if you wish.

## Ask Questions!

But it really doesn't help much to attend a school meeting and to do nothing but mumble "yes" whenever the chairman puts a motion. If you have never interested yourself in your school, maybe that is all you can do this year. On second thought, it's not all you can do. You can ask questions about any proposition you do not understand. You can resolve that you will not vote until you know the facts and until you are sure that all present understand the proposed action.

Then you can make a second resolution to visit your school occasionally in the future, to study its problems, and to work for its improvement so that when next year's meeting comes you, and others like you, will have a constructive program to offer.

If we in America ever lose our liberties it will be through indifference or ignorance. Indifference may be best characterized by our failure to vote on

## QUALIFICATIONS OF A VOTER AT SCHOOL MEETINGS IN NEW YORK STATE

### A VOTER MUST:

1. Be a citizen of the United States.
2. Be at least 21 years of age.
3. Be a resident of the district for a period of at least 30 days preceding the meeting at which he or she wishes to vote.

In addition to the above, all voters must have at least ONE of the following qualifications:

1. Must own, lease or hire real estate subject to taxation within the district. (Where the deed or lease is joint, both persons may vote.)

OR

2. Must be the parent of a child or children of school age, providing such child or children shall have attended the district school in the district in which the meeting is held for a period of at least 8 weeks during the year preceding each school meeting. (Both father and mother may vote.)

OR

3. Not being a parent, has permanently residing with him or her a child or children of school age who shall have attended the district school for a period of at least 8 weeks during the year preceding such meeting. (In this case, only the head of the household may vote.)

Election Day and by our willingness to let those our neighbors elect run things with little or no supervision. To be sure we grumble enough about what transpires at Washington or Albany, but we seldom take the trouble to tell our congressmen what action we wish them to take.

## Ignorance Is NOT Bliss

Yet no matter how interested the voters might be, an ignorant electorate could never make democracy work. That is why our forefathers established schools as soon as they gained a foothold on this continent.

Englishmen worked and fought for centuries to win freedom from kings who maintained they had a divine right to rule their subjects. Frenchmen won a bloody revolution and for a brief time liberty became license until the civilized world was shocked. Our ancestors fought to win and maintain liberty in the New World, but in recent years we seem to have forgotten some of the virtues they exemplified. We have neglected thrift, initiative and we have looked to government for hand-outs, for security, and for decisions we should have made ourselves. We need to look the facts in the face and reverse the trend.

If, throughout the Northeast, attendance at all school meetings during the coming year could be doubled or tripled, a long step would be taken in the right direction. The first place to make grass-roots democracy work is in your school, your town, and in your county, and the way to do it is to understand the problems, to attend the meetings, to state your position vigorously, to vote intelligently, and then accept the will of the majority.

— A.A. —

"One of the things we have to be thankful for is that we don't get as much government as we pay for."

# OTSEGO COUNTY POLICYHOLDER KILLED

Awaiting the arrival of the coroner, the body of Donald B. Harrison, 26, of New Lisbon, N. Y. lies on the pavement of Elm Grove road, where he was instantly killed when the car in which he was a passenger went out of control, hurling him through the roof and then rolling across his body.

North American Accident Insurance Co.  
Ithaca, New York

Dear Mr. Weatherby:

This will acknowledge receipt of checks totaling \$2,050.00 delivered to me in behalf of Mrs. Mamie Harrison, mother and beneficiary of Donald Harrison, deceased, one of your policyholders who lost his life in an automobile accident.

It was fortunate that Donald carried two policies so his beneficiary drew double protection.

Over the years I have helped several of your policyholders with claims and we have always received prompt settlement and courteous treatment from your Company and its representatives.

Cordially yours,

Chester T. Backus

## GRASS ROOTS CONTROL

One of the simplest and most understandable statements of the functions of various levels of government was made by the late Dr. G. F. Warren of Cornell University. As I remember it the statement was about like this:

"Citizens, either as individuals or voluntary groups, should do for themselves everything they possibly can.

"Local government units (town and county) should do only those things which the citizens cannot satisfactorily do.

"The state should do only those things which the local government cannot do, and the Federal government should do only those things that the State cannot do."

If this simple rule were followed, there would be a lot less bureaucracy and a lot less government in business, and a lot more "grass roots" control.—H.C.

# PROTECT YOUR COWS— PROTECT YOUR MILK CHECK

## SWITCH TO GENUINE

# TUG & PULL

**NO CALF, NO MAN, AND NO MACHINE CAN DO A SAFE, COMPLETE AND SATISFACTORY JOB OF MILKING COWS WITHOUT TUG & PULL**

Ask your Surge Service Dealer to come out and show you *on your own cows* exactly why a SURGE milks so *fast and clean and safe*. See for yourself how Genuine SURGE Tug & Pull protects your cows by keeping the teat cups from creeping up and pinching the delicate part of the udder.

Let your Surge Service Dealer show you how *thorough* SURGE milkings can help you cut down the time, work and expense of milking cows. Genuine SURGE Tug & Pull gets the milk fast without a lot of hand help and stripping.

In 1950 more thousands of farmers than ever before switched to SURGE because they wanted fast, safe, clean and profitable milkings.

It might pay you well to let your Surge Service Dealer show you what Genuine SURGE Tug & Pull will do to make *your* milking more profitable. He'll be glad to come out to your farm. Call him.
